and wrote many works on the primeval sacred Magian religion. He reformed the ancient religion which had degenerated, and he was very holy. It was in the same way that Buddha came, as the last of a long line of Buddhas, to restore the original teaching. Thus, we see, that a "Christ" is an incarnation of divinity; a *perfected man*, but not essentially different from other men. And here is the point: we are all potential Christs. The Christ or Christos is in every man; and this subject the clergy are now taking up. Notwithstanding this, we must remember that there is this difference: when we speak of these world-saviors we speak of those who are our Elder Brothers. They belong to a prior stage of development, and in them the Christ-spirit has become self-conscious. They have reached to a stage which we shall not attain unto for a long time. They belong to an older cycle of humanity and they come from time to time to point out the way to humanity. As an illustration of this teaching that saviors come into the world from time to time we may quote from the *Bhagavad Gîtâ*, where Krishna says, "I produce myself among creatures, O son of Bhârata, whenever there is a decline of virtue and an insurrection of vice and injustice in the world; and thus I incarnate from age to age for the preservation of the just, the destruction of the wicked, and the establishment of righteousness."

Now, about Jesus of Nazareth, we do not know just when he lived. There are no absolutely authentic references to him in the ordinary authors. Some say that such a man lived some time before the beginning of the Christian era, some make him to have lived later. But there seems little doubt that there was a World-Savior who lived about that time; and that he came to reform faith, and establish righteousness. The miraculous stories which we read about him are told of other great teachers; we have seen that they are universal. His miraculous birth is similar to the story about Krishna. In Moor's *Hindû Pantheon* is a picture of Krishna nursed by his mother the Hindû virginal Devaki. The hair is brushed back, the veil is long, and there is a golden aureole around the virgin's head as well as around the head of the Hindû Savior.

"In the south entrance to the Caves of Ellora may be seen to this day Indra's wife, Indrani, sitting with her infant Sun-God, pointing the finger to heaven with the same gesture as the Italian Madonna and Child." (*Isis Unveiled*, II, 95); and, "among the beautiful plates of Maurice, there is one representing Krishna crushing the head of the Serpent. A three-peaked miter is on the head (typifying the holy triad), and the body and tail of the conquered serpent encircle the figure of the Hindû God. (*Isis Unv.*, II, 446)

"From the Hari-Purâna, translated from the French version: King Angashuna's daughter Kalavatti, is stung by a serpent and dies. Krishna approaches. 'Master,' cried the king, 'see my poor daughter!' 'Why do you weep?' replied Krishna in gentle voice. 'Do you not see she is sleeping? . . . See her cheeks resuming their color; her eyes, whose eyelids tremble as if they were about to open. . . . She is sleeping, I tell you; and hold! See, she moves. Kalavatti! rise and walk,' and she comes to life." (*Isis Unv.*, II, 241)

Then there is the Crucifixion; this is a very old symbol in the Mysteries. The Cross is a symbol known everywhere. One form of it is the Svastika, found in Mexico, and in Tibet; and in Scandinavia where it was known as Thor's hammer. Another form in Egypt was known as the *ankh*. It represents matter or material life. The four arms were

the four elements, earth, air, fire and water. In the Egyptian Mysteries the Candidate for initiation was fastened to a cross. H. P. Blavatsky says: "Verily may the Cross be traced back into the very depths of the unfathomable Archaic Ages! Its Mystery deepens rather than clears, as we find it on the statues of Easter Island—in old Egypt, in Central Asia, engraved on rocks as Tau and Svastika, in pre-Christian Scandinavia, everywhere! . . . 'To crucify before the sun' is a phrase used of initiation. It comes from Egypt, and primarily from India. The enigma can be unriddled only by searching for its key in the Mysteries of Initiation. The initiated adept, who had successfully passed through all the trials, was *attached*, not *nailed*, but simply tied on a couch in the form of a *tau* T. . . . He was allowed to remain in this state for three days and three nights, during which time his Spiritual Ego was said to confabulate with the 'gods,' descend into Hades, Amenti, or Pâtâla, according to the country, . . . In Egypt [the body] was placed in the Sarcophagus in the King's Chamber of the Pyramid of Cheops, and carried during the night of the approaching third day to the entrance of a gallery, where at a certain hour the beams of the rising Sun struck full on the face of the entranced candidate, who awoke to be initiated by Osiris, and Thoth the God of Wisdom." (*The Secret Doctrine*, II, 557-8)

Thus we see that the Cross and Crucifixion were connected with the mystic ceremonies for the initiation of candidates for wisdom. In early Christian times the Gnostics had this ancient Egyptian symbolism of the Cross. When it is said that Christ was fastened to the Cross, it means that he, the divine Soul, has to descend into matter. The Crucifixion and Resurrection are emblematical of every man. For the Soul, the real man, is the eternal Pilgrim. This life is one of a series, and the Christos, the real man, is fastened to the cross of matter, or physical existence, which he first suffers by, and finally overcomes. Jesus himself had an inner school, for it is said, "unto you it is given to know the mysteries of the kingdom of God, but unto them that are without all these things are done in parables." But his esoteric teachings have been lost. (OBSERVER.)

## Famous Journalist is Visiting Point Loma

Carl Ramberg of Sweden on Tour of the World

CARL RAMBERG, one of the best known Swedish Journalists, is a guest at Point Loma. Mr. Ramberg is making a tour around the world in connexion with his paper, the *Goteborg Handelstidning*, one of the largest and most influential papers in Sweden, of which he is co-editor with Mr. Torsten Hedlund, who is president of the International Brotherhood League in Sweden, and one of the most prominent workers in the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY. Mr. Hedlund and his wife accompanied Mrs. Tingley and her party through Sweden, Finland and Russia.

Mr. Ramberg arrived only last week at San Francisco from Japan and has come here expressly to visit Point Loma. Saturday evening a reception to him and a concert by the Point Loma students was held in the great Rotunda of the Râja Yoga Academy, and at the meeting last evening at Isis Theater, Mr. Ramberg, as Mrs. Tingley's guest, occupied her box which had been beautifully decorated with the Swedish and American flags. Several of Mrs. Tingley's Cabinet officers and students were also present.—San Diego Union, Jan. 27, 1908.

# Art Music Literature and the Drama

## The Lyric in Music and Poesy

AS the perfect lyric touches and thrills with its own golden life the wave-crests of that Great Deep known as "Poesy," so the perfect musical setting of lyrical verse is the very refinement of musical art—the consummate touch which awakens and vivifies the purpled heights of Soul. As out of the simple song grew, by degrees, the marvelous polyphonic structure that we know today as "modern music," so back to the song, the simple song, must modern music turn when it rises to what the poet has called "the higher heights."

Nothing in the musical work of Lomaland has contained more promise of that finer musical era, only now in the dawning, than the contrapuntal setting of Shakespeare's "I know a bank whereon the wild thyme grows," by one of our younger students of composition. for many a great composer has failed when it came to the setting of a simple song—because that is the test which dips down deep into the life and evokes the magic counterpointing of musical line with line if there be richness and soul strength, while it evokes but echoes if there be emptiness. Tennyson, of blessed memory, says one writer,

had a rooted objection to the musical settings of his own songs, giving as the reason for this that the music always went up when he wanted it to go down and down when he wanted it to go up!

The same writer relates that upon one occasion, in looking through an album of songs, all of which were his own poems set to music, the poet selected as worthy precisely the ones which a modern master of music would select—and this without knowing the names of any of the composers. Yet we read in a certain biographical account that Tennyson was "one of the most unmusical of men"! The song most highly praised of all by the poet was Joachim's exquisite setting of the English bard's *Rain, Rain and Sun*. But Tennyson was called unmusical, as if one in whose soul throbbed not the rhythms of all the ages could have given us *Locksley Hall*, *Maud*, *The Princess*, and lyrics almost the rarest the world has known. Tone and word, poem and picture in sound, one and yet not one, colors of the one gleaming prism which shines with seven times seven clear fires and is called—the life!

## The Journeyings of Simple Songs

PROPOS the lyric in music, Wilhelm Tappert has the following to say of melody, or rather, melodies, which he terms "the most untiring tourists on earth." To quote from one of his most sympathetic chapters:

They forge surging streams, cross the Alps, pop up far across the oceans, and, nomad-like, inhabit the desert; and everywhere they meet other melodies bound in the opposite direction. Aided by that essentially human curiosity in everything that is strange, many a melodic Cinderella has achieved high honors far from its fatherland; has been made into a patriotic song perhaps, or a national hymn

whose strains have stirred whole peoples to mighty response. On the other hand some of the wanderers have returned more or less disguised, half masked or even completely changed, and were able to celebrate glorious triumphs in their old homes as "imported" melodies. There is no musical police which inquires about birth certificates and passports. However, aside from the world trips of some melodies, there is also an imposing measure of travel at home. The melodious wanderers are always on the go; from the workbench they move to the streets and roads, country travelers carry them to the inns, and from there they find their way to the tiniest towns, the remotest hamlets. At country dances, in city ball rooms, nurseries, concert halls—from all those places the melodies escape and mix with the sowers

## THE WINNOWING OF THE CORN

From the French of JOACHIM DU BELLAY, a poet of the Fourteenth Century. English by LOIS BENNETT.

To you, winds so fleet,  
Who with winged feet  
Run the world around  
And with murmur soft  
Lift the trees aloft,  
Shadowing the ground:

I offer you the violets  
The lilies and the flowerets  
And the roses here,  
The fair crimson roses  
The early morn discloses,  
And the daisies dear.

Ah, with your sweet air  
Fan this place so fair  
Linger here, I pray,  
Where, throughout the morn,  
I throw my streams of corn  
In the heat of day.

WALTER PATER says somewhere of the old French poet, DU BELLAY: "He has almost been the poet of one poem. It is the song which the winnowers are supposed to sing as they winnow the corn, and invoke the winds to lie lightly on the grain."

"One seems to hear the measured falling of the fans, with a child's pleasure at coming across the incident for the first time in one of those great barns of Du Bellay's own Country, *La Beauce*, the granary of France. A sudden light transfigures a trivial thing, a weather-vane, a wind-mill, a winnowing flail, the dust in the barn door; a moment—and the thing has vanished because it was pure effect; but it leaves a relish behind it, a longing that the accident may happen again."—*The Literary Digest*

and reapers in the field, accompany the huntsman on his forest trips, and help to shorten the hours of the sentry on duty. From the theater, through the streets, these melodies sometimes find their way into—church! And sometimes the process is the other way round! Some of them resemble the Wandering Jew, never resting, never dying. Some motives have shown such surprising vitality and hardihood that their existence is almost as old as the history of the world. Many of them first blossomed in the poetical age of the Minnesingers, took part in the ceremonies and carousals of the Meistersingers, and now seem to be destined to eternal rest within the walls of the Church. On the other hand, another aggregation of melodies followed the storm and stress career of the Wittenberg Reformer and fled the incense-scented darkness of the Catholic Cathedrals for the light, vasty halls of the Protestant houses of worship.

Whoever sees much of the world, and is compelled to adapt himself to other lands and peoples,

will in time undergo certain subtle changes, acquire some of the habits and speech of this place or that, and may even at the end be taken for a stranger in his own land, and a native in others. Our melodic adventurers are liable to the same fate. Never, or almost never, do they remain what they were originally. Sometimes only a very short journey suffices to make the change, and on the way to visit a neighbor they drop some little characteristics whose places are at once taken by others, and when they arrive at their destination they are already disguised beyond recognition by any but their oldest friends. This point is amply demonstrated by a study of the endless, almost daily, changes to which the folk tunes of all nations have been subjugated throughout the centuries—and which they are still undergoing. The process of reconstruction or evolution is endless. H. H.

## Color Photography the Handmaid of the Arts

A VERITABLE magician's palace of wonders is being opened for the student of today by the new process of color photography. For some time the great treasures of literature have been accessible to students all over the world through the simple photographic processes which made it possible to place in our schools and universities photographs of works the help of which has been denied heretofore to those who had not time and money to spend in travel.

Color photography is doing even greater things. One of the rarest as it is one of the most beautiful examples of work in this new art, has been placed in the library of an eastern educational institution in the shape of a series of reproductions of the famous *Breviary Grimani* and the *Hortulus Animae*, two of the oldest manuscripts of their kind in existence. The original of the *Breviary* is preserved in the Library of St. Mark's in Venice, while the other is almost sacredly treasured in the Royal Museum of Vienna.

The *Breviary*, which is considered to be one of the most superb productions of the miniaturists of the Flemish school, is believed to have taken ten years in the making. It was begun probably in the fifteenth century and the series of paintings, all done on vellum, and which make the book of over eight hundred pages one of the most remarkable works of its kind extant, begins with the signs of the zodiac, followed by agricultural and pastoral scenes, then by a long series of sacred subjects. According to the critics, Hans Memling, one of the greatest of Flemish miniaturists, was the chief contributor; another was undoubtedly Gerard of Ghent. The twenty-four miniatures which refer to the calendar, are all from the hand of Memling. The reproductions of these volumes are remarkable for the accuracy and fidelity with which they reproduce line, tone-value, and color. There is a special significance, it would seem, in all this in connexion with the present time. To make generally accessible faithful reproductions of the ancient and precious records that our archaeologists are every year—every month, almost—bringing to the light is, considering the present urge for a closer study of history, a praiseworthy service indeed. # THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## Symbolism of the "Archer"

WILLIAM Q. JUDGE once wrote in the *Path* magazine an article on archery, pointing out the pregnant symbolism of the bow and the archer. We know that Apollo was an "archer-god," and that one of the twelve chapters of a certain mystic ancient book which we still have is called Sagittarius and represented by a man shooting with a bow. Virgil states that Acastes shot his arrow with such force that it took fire as it flew and went up into the air all aflame, thus opening from the place where the archer stood a pathway of light into the heavens.

Sagittarius comes next to the Scorpion or Dragon and represents aspiration or the re-ascend and redemption of Man after a fall into matter. The original spark of Divine Flame, which has gone through so many changes, as Man went from stage to stage in the sequence of his destiny, never died out, and now rekindles into a dauntless determination to achieve again the heights from which he descended. The Christos (Man in his Divine Selfhood) descends into Sheol and rises again.

Sheol or "Hell" is the lowest condition of materiality, where the Light is shut out and passions and ignorance rule. And has poor Man a still worse place in store for him after death? Nay, death is a welcome and needed rest and refreshment. The hell is in this life, and Man climbs out of it by the grace of the Divine Flame still burning in his breast.

Book-learned pedants may tell us that the ancients labored to perpetuate in symbolism the courses of the astronomical sun through its cycles and the changes of the seasons; but it was this sublime truth of the procession of human Souls through the cycles of destiny that they really symbolized. The Sun was to them Nature's best symbol of the Divine Flame, and in his cyclic motions they found exact symbols of the career of the Soul. To them the possibility of Man's re-ascend to a nobler manhood—the regaining of Paradise—was a sublime truth.

In all ages the gateway has been open for this re-ascend. It is the destiny of every man, after finding out the unreality of the passionate life, to seek the true key and learn to Live again in the true sense. This is the great Promise—not the promise of a heaven of selfish bliss in a future state, but the promise

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

of Man's redemption by his own Divine Manhood. STUDENT

## Hypnotism and Crime

ONE does not care to treat the question of hypnotism as a separate question, but rather to consider it as a special case of a general question—the question of influence between people. In the ordinary circumstances of life people influence each other, but the discovery of the particular process known as hypnotism has brought the question into prominence. The thing illustrates the truth that knowledge brings with it responsibility—that things which may pass unheeded and comparatively harmless while we are ignorant become matters of concern and danger when we become enlightened. This question of hypnotism, therefore, brings up the whole question of the influence of mind upon mind.

A professor says that the criminal impulse comes to the unbalanced person like a foreign intruder, and takes hold of the personality without free choice of motives, thus causing him to interpret his unaccountable persuasions as the result of strange outside influences. What does this mean? It means that the human organism (physical, astral, psychic) is a machine, ready to be actuated. Normally the will acting under intelligent guidance should control it. Short of this control, there may be many gradations. Ordinary temper, anger, and passion, for instance, or lust and appetite, or fear and grief, may play upon this instrument, causing convulsive action, opposed to the intelligent will. The ordinary scientist regards these emotions as results of the working of the machine; but, as a fact, they are forces which play upon the machine. The machine would otherwise be quiescent; but these forces come in from somewhere and actuate it. Now to the Theosophist, who has studied human nature in aspects neglected by science and religion, these emotional forces that play upon the unguarded organism are actual entities. They

have an actual existence in the invisible planes of nature, where they exist in as much actuality as forces like heat and electricity exist on the physical plane. These forces, moreover, are not so mechanical as those of the physical plane; they are semi-intelligent. They were created by man himself, through the indulgence of his passions. They

pass from one person to another, gaining increments of strength and varying qualities. They accumulate in the invisible planes of nature, and man lives in them and breathes them like a fish in water. The origin of these impulses cannot be exactly traced. Very likely they are those we have ourselves created, and which are therefore bound to our sphere, coming to us from time to time for fresh supplies of energy. Thus the passionate man continually feeds and strengthens these elemental forces, until at last they may grow strong enough to overpower his self-control and he may become a violent lunatic or criminal. These elementals may pass from him to others, influencing them to acts, and then come back reinforced to their original owner.

Thus people who indulge evil thoughts and desires are continually playing the part of hypnotists, suggesting crimes to weak natures, who yield to them; and the real culprit may be some unsuspected person who is not even himself aware of his culpability, but is not thereby released from responsibility.

People can be influenced to do things which they are inclined to do; but it is very difficult to make them do things which they are not inclined to do. Herein lies safety for the strong and pure. If we set a watch over our own threshold, extraneous forces cannot get in, and the effect will return upon the originator of the force. The originator, on his part, should bear in mind that he is responsible for every act committed under his influence; and that the laws of nature will see that the due consequences are visited upon him.

It is perhaps unnecessary to add, what has so often been said in Theosophical literature, that the practice of hypnotism is most dangerous both to subject and operator, and that benevolent motives cannot save people from the consequences of ignorant meddling with dangerous powers. There are plenty of ways of doing good and curing people without practising this kind of moral vivisection. STUDENT

Path

**"THE SPIRIT TAKETH NO STAIN"**

O Prince!

That Ultimate, High Spirit, Uncreate,  
Unqualified, even when it entereth flesh  
Taket h no stain of acts, worketh in nought!  
Like to th' ethereal air, pervading all,  
Which, for sheer subtlety, avoideth taint,  
The subtle Soul sits everywhere, unstained:  
Like to the light of the all-piercing sun  
[ Which is not changed by aught it shines upon, ]  
The soul's light shineth pure in every place;  
And they who, by such eye of wisdom see  
How matter, and what deals with it, divide;  
And how the Spirit and the flesh hath strife,  
These wise ones go the way which leads to Life!  
—From Sir Edwin Arnold's rendering of the  
*Bhagavad Gītā*

**The Old Lighthouse**

**A**N incident of my boyhood is vividly im-  
pressed on my memory, and I have oft-  
en thought of it since, as conveying a  
lesson which has a very wide application to  
the varying experiences of daily life.

Many years ago my younger brother and  
myself aged respectively 12 and 14 were spend-  
ing our summer holidays with our parents  
near an old-fashioned fishing town at the  
mouth of a river, which broadened out into  
the deep Atlantic. We had fished for crabs  
and lobsters among the rocks, sailed up and  
down the bay, bathed in the early morning on  
the sandy beach, and generally exhausted al-  
most every form of amusement the situation  
offered. But there was one thing which we  
had never yet done, and which we had often  
talked of and longed to do.

About two miles out to sea, and opposite the  
river mouth, on a rocky islet stood an old  
wooden lighthouse. It was erected on heavy  
beams clamped together into a sort of tower,  
and there was a house standing on a kind of  
platform at the top. From the lantern on the  
roof of the house a light gleamed forth every  
night at sundown, and through a telescope we  
could see the men who lived in the house  
moving about on the platform outside, and we  
could see the steep ladder by which people  
climbed up and down the wooden staging to  
the rocks far below.

So at last we determined we must go to the  
lighthouse, and having engaged a little fishing  
boat we set off one fine morning in search of  
adventure. The tower did not look so very  
big from the bluff overlooking the bay, but  
as we approached, it seemed to grow taller  
and taller, until at last as we made fast our  
boat to the foot of the ladder, it appeared to  
reach far into the sky above us, and the almost  
perpendicular steps of iron, driven into a gi-  
gantic beam, tapered away to an awful and  
giddy height.

Our hearts failed us, and we looked at one  
another in dismay. What if we should fall!  
We had almost determined to turn back, when

the old fisherman in the boat came to the  
rescue.

"Don't you be afraid lads," he said, "take  
fast hold on the ladder, and take one step at  
a time, and whatever you do, don't look down.  
Keep your eye on the top."

Encouraged by this advice we followed it  
to the letter, and arrived safely on the upper  
platform. Then for the first time we ventured  
to look over the railing and enjoy the glorious  
view which surrounded us. Our little boat far  
below looked like a little shell upon the ocean.

When we had thoroughly explored the mys-  
teries of the great revolving lamp on the roof,  
and had talked with the keepers, we returned  
safely home.

Now herein lies an allegory, and its appli-  
cation may be discerned in questions of the  
most abstruse character. If rightly applied  
it will point out the right attitude in some ques-  
tions of the most refined subtlety.

There is a picture by the late Sir Noel Paton  
called *Faith*, which was much admired when  
exhibited at the Royal Academy. It was after-  
wards purchased by the late Queen Victoria  
of England. It represents a knight in full  
armor who is climbing a dark and rocky moun-  
tain. The path is almost obscured by clouds,  
and there is only just light enough for him to  
take one step at a time. Above him, on the  
summit, through a rift in the clouds, which  
are drawn aside like a curtain, streams a glori-  
ous light which illumines the face of the toiler.  
His gaze is directed to it. He is weary and  
the road is steep and dark, but there is a look  
of will and power about the face and figure  
which tells the tale of unyielding determination  
and ultimate success.

Many reflections are suggested by these sym-  
bols. They are typical of almost every serious  
effort of human life. And if the objects thus  
attained have sometimes proved unworthy of  
the aim, and of the greatness of the effort,  
and we have been disillusioned, shall we then  
say that we have climbed in vain? Not so,  
for if we had not climbed, we might not have  
known the truth. There are always opportuni-  
ties to make further effort upon the basis of  
the new experience.

If a man is known to be engaged in some  
reform movement for the benefit of humanity,  
and his motive is pure and simple, he has his  
eye on the top of the ladder. If his interest  
is tainted with ambition, or with a desire to  
occupy some outside shell of personal status,  
or by an impulse to be busy and have his own  
way, he is deluded by a myriad phantoms in  
the surrounding prospect. His foothold is in-  
secure and he is in the greatest danger of  
failure.

And he who climbs the heights of soul  
experience would do well to remember that it  
is not good to look back upon the past, until  
his feet are firmly planted. One step at a time,  
and a firm grasp of the path of effort is enough.

In these endeavors any effort to take stock  
of his position is apt to make the climber dizzy.  
A thousand objects strike the eye on every  
side, if you remove it from the goal. They are  
near—they are distant—they are foreshort-  
ened, they shimmer in an uncertain light of  
illusion. But if the toiler will persevere, tread  
surely and hold tight, he will suddenly either  
arrive at the summit or upon a platform where  
he can rest for awhile in safety. J. H. R.

**FRIENDS IN COUNSEL**

**"I SAID to myself."** How often we use  
these words without realizing what  
they imply. "I said to myself I must  
not do this, I should not do that." What is  
this "I" which speaks to "myself"—which  
speaks but does not argue? If it is indeed the  
conscience that speaks and that we refer to  
as "I," what is the other "I" to which it  
speaks?

In answering this question, and in follow-  
ing the ancient injunction "Man know thy-  
self," one way is by means of elimination.  
One may separate the "I" from the things  
it uses and so eliminate them. If "I" use the  
body, "I" cannot be that, any more than "I"  
can be my clothes. I use the brain and I use  
the mind. I devote it to this or that; I con-  
trol it albeit imperfectly as yet; therefore  
"I" am not that.

Then there is the conscience: can I say that  
I use that? It is evident that I am getting  
nearer to the self. What then is it that we  
call the conscience? It is one of the dangers  
of words and formulas that when we have  
once formulated a thing we are apt to think  
it is settled and cease to think of it. But how  
are we to know what the conscience is? Can  
we know it by merely thinking about or defin-  
ing it? To know what the conscience is one  
must identify oneself with it; to really know  
it one must become it. To become it we must  
first follow it and learn its will, until at last  
we can say "Not my will but thy will be  
done."

To find this self within which now mani-  
fests as conscience is the path of the Theoso-  
phist. The sacred science of Rāja Yoga shows  
us the entrance of this path and will guide us  
all along the way. STUDENT

**Work**

**K**ATHERINE TINGLEY has said: "The  
knowledge that we are divine gives the  
power to overcome all obstacles and to  
dare to do right," and what greater incentive  
to high endeavor can there be than this know-  
ledge of our divinity? Once realize this, what  
man or woman can be idle?

It is only through ceaseless unselfish work  
that we are able to express our divinity. Ac-  
tion is a law of nature and is one of the main  
channels through which evolution proceeds.  
In other words, action is a necessity to growth  
and progress.

Theosophy teaches there is no such thing  
as dead or blind matter, as there is no blind  
or "unconscious law" in the universe. We  
cannot separate ourselves from Nature. The  
law of cause and effect, the ceaseless ebb and  
flow of the tides is evidence of this active  
force at work.

It is because we have failed to work with  
Nature and to conform to her laws, that we  
and all humanity suffer today from unrest and  
discontent. It is natural for man to work, and  
may not the love of ease and idleness be one  
cause of the disease and suffering in the  
world? If we cease for even a short time to  
use any muscle or portion of our body, its  
strength and power is weakened. And this is  
also true if we fail to make use of our facul-  
ties or perform our work in life. STUDENT

## SONNET

By James Russell Lowell

WHY should we ever weary of this life?  
 Our souls should widen ever, not contract,  
 Grow stronger, and not harder, in the strife,  
 Filling each moment with a noble act;  
 If we live thus, of vigor all compact,  
 Doing our duty to our fellow men,  
 And striving rather to exalt our race  
 Than our poor selves, with earnest hand or pen,  
 We shall erect our names a dwelling place  
 Which not all ages shall cast down again;  
 Offspring of Time shall then be born each hour,  
 Which, as of old, earth lovingly shall guard,  
 To live forever in youth's perfect flower,  
 And guide her future children Heavenward.

—Selected

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** What answer would you make as a Theosophist to one who claims to be an individualist and who holds that the evolution and preservation of the individual is the great purpose of nature? Although a good-hearted man he cannot philosophically, as he says, reconcile the practice of altruism with his theory of Individualism which he holds to be true.

**Answer** The position taken by the one referred to, can, I think, arise only from a lack of knowledge of the real nature of man which a study of Theosophy, if taken up in the right spirit, would surely dispel. Let us first consider an illustration which by analogy may help us to understand man's true relation to his fellows. The body of man, we are taught in science, is made up of cells. Each of these has its own individual life; it comes into being, grows, matures, dies, giving place to others which in their turn go through the same process. But these cells are not separate or disconnected from the rest, but all share in the life of the organism, man. Each one also affects and is affected by all the others; if it is well and strong it adds to the strength of the rest; if it is weakly or sick it in like manner affects the rest. Let us imagine now, that an individual cell determines to live its own life and to disregard its fellows. It will no longer share in the health or sickness of the others, but so too it no longer can reflect and share in the synthetic consciousness of the whole organism, that is of the man himself.

This really would be the case of the extreme and consistent individualist. He might feel satisfied with what little consciousness he thinks he possesses, but as a matter of fact if it were possible for him to be an individualist and live for himself alone in actual reality and not in mere theory, he would find perhaps that the consciousness which belonged to him as separate from the rest of his fellows was so small that he would be in intelligence lower than the rudest savage. But such is not possible in fact however much the theory may be held to. To cut ourselves off from the rest of humanity in actual fact would mean death, just the same as to separate an individual cell from the organism of which it is a part would be death to that cell. There might still remain both in the man and in the cell a rudimentary physical life but there could be nothing higher, for the higher depends always

upon association with others of like nature.

Even the teachings of science show that all growth and power come through association of one individual with others of like nature, though in the modern scientific theory but a small part of the real life history is told. Yet it is shown that growth and progress depend on the building up of organisms of greater and greater complexity, and examples are given in any science text-book showing the successive stages in complexity and consequently in growth of consciousness from unicellular life through organisms of greater and greater complexity up to man.

For a moment let us consider what altruism means in terms of consciousness. In the first place altruism means the recognition of others and an extension of consciousness that enables one to cognize the needs, the thoughts and feelings of others. Now, in our present state of development all this is done to a great extent without any volition on our part, but altruism in its true sense implies volition; it implies an effort to understand others and extend our consciousness so that it can take cognizance of theirs.

According to this, altruism is therefore a power that brings us into association with other like units and therefore tends to build up a greater organism — this greater organism being in fact humanity in which individual men and women may be considered as playing the same part as do the cells in the physical body of man. One step further: as organisms of greater complexity are built up they provide instruments or vehicles through which can act a greater synthetic consciousness, for an organism is such by virtue of a synthetic power and a synthetic consciousness. It is not merely an aggregation of cells or individuals of like nature. More than one student and writer has touched the fringe of this subject, but in Theosophy alone is the full explanation given of humanity as an organism in process of becoming a still greater organism.

We may go a step further. It is generally accepted as an established law that there is no standing still in nature; where the building up of an organism is not going on there is the breaking down of one, and according to what has been said it will be seen that the building up of an organism implies a widening of consciousness; a recognition not only of other individuals of like nature with ourselves but of our welfare as bound up with theirs.

In view of the above the individualism that is hinted at in the question is suicidal; it means a gradual contraction of one's powers with less and less hold upon the powers of life. But again Theosophy will help us to understand the subject in a new light. Is there not a true individualism just as there is a true individual as taught in Theosophy? Let us look at the root of these words for they are both derived from the same root and both akin to another word which in their higher sense truly defines them, namely, *Indivisibility*, and this brings us to the consideration of one of the main teachings of Theosophy, namely, that in essence and at the root of their being men are all of the same nature, divine, and are not separate one from the other, but in very truth partake of the same individual, or *Indivisible Life*. In our outer natures alone does separateness exist, and the modern doc-

trine of individualism is nothing more than an accentuation of this separateness and is contrary *in toto* to the real basis of being.

Such a subject as this shows how poor is our language to express deep philosophical truths. The great majority of humanity do not realize the wider life of which they are a part; they do not realize that humanity as a whole is a vast organism, and yet this is one of the steps on the pathway of evolution, namely, so to expand our consciousness that we shall feel with all human beings. Turning again to the analogy of man and the cells of the human body; imagine what it would mean to a cell which has its individual (here is the paucity of our language again) life and consciousness, to be able so to expand that consciousness and reach upward and outward that it could realize all that the synthesizing soul realizes; in other words that the cell's consciousness should expand and become one with our consciousness. This by analogy shows the enormous possibilities that are before man, and not possibilities merely, but his destiny, to become one with the soul of the world, one with the Over-soul, and the power that shall take him along this glorious pathway is that which in our present state of consciousness is described and known as Altruism. Through Altruism alone can the human units come into such accord that they may provide a focus for a greater consciousness to play through them, and through Altruism alone can they become one with this greater consciousness.

STUDENT

**Question** Shall we always continue to make Karma? Is there no end to this process of sowing and reaping?

(SEE CENTURY PATH, VOL. xi, NO. 10)

**Answer** II. By leading a larger life and ceasing to live for our own selfish ends we shall cease to make Karma which affects merely the personality, but we shall share in the wider Karma of the great mass of humanity; we shall consciously become a part of the whole human race, and our Karma will become one with it to the extent that this merging of the individual interests in the interests of the whole is complete.

It should be understood, however, that the soul cannot remain inactive. Even in that which to us appears to be a period of rest the soul is active on another plane, and it is part of its nature to create; in fact it lives in what we might call the ocean of Karma. As said in the *Bhagavad Gītā*: "No one ever resteth a moment inactive." All that we can do is to direct the course of our action within the limits of our freedom, which we can expand if we will to the widest bounds of the universe. Therefore, with a little reflection we shall not ask the question: Is there any end to the process of sowing and reaping? We shall rather rejoice that we can act with the Law and that we can sow seed that shall result in a harvest of good for all. It is this that concerns us and not as to whether there may be an end. If there were, it would be a denial of our own divinity and immortality, and indeed a denial of our own existence.

STUDENT

CAUSES sown each hour bear each its harvest of effects, for rigid justice rules the world.—*Book of the Golden Precepts*

### How Shall We Deal With Degenerates?

THE treatment of crime is the subject of many learned disquisitions and debates, and we hear a good deal about the brain and pathological conditions, and whether the criminal should be treated as a responsible sinner or an irresponsible patient.

But the real question is perfectly simple all the while. What is really lacking is the power and means to apply the remedy. These elaborate theories are only attempts to get around the real issue and find some easier way. It is so in all life; we shirk plain duties and try to achieve the same result by some elaborate means.

Criminality can be simply defined as the loss of self-control; and there is no need to go into an elaborate analysis as to what is the controlling power and what are the faculties to be controlled; everybody knows this well enough for practical purposes. The trouble is that there is not sufficient unity and unanimity among the people to allow of an adequate provision for the teaching of self-control. We see this everywhere. Beginning in the home of childhood, we find that the child is not taught proper self-control because the parents themselves do not possess this quality. They give way to the child's self-will, indulge his weaknesses, and utilize his childish graces as a source of pleasure for themselves; thus developing in him self-will, infirmity, and vanity. They permit the growth of unnatural and destructive habits because they have not the courage to face them or even to allow themselves to admit the existence of such habits.

With such examples as this before us—and they are universally prevalent—can we wonder that we fail to deal effectively with the criminal? Is it likely that people who have not the strength to do their duty at the beginning, where it is comparatively easy, will have the strength to do it later on when it has grown much harder? This example of the parent and child is typical of the whole order of society; and the principle involved in it will apply to the doctor and his patient, the jailer and his prisoner, the clergyman and his disciple.

It is useless to shirk the plain fact that control of others, and the teaching of self-control to others, demand self-control on the part of the teacher. It may be handy to attempt to avoid this necessity by substituting pathological treatment or resorting to violent methods, but it is not logical or candid.

Take the case of a drunkard for instance. Where on earth can we place him away from the temptation to drink? In every town, in every village, in every country habitation; in every land, home or foreign, Eastern or Western; on an ocean voyage; everywhere alcohol. And not only the opportunity to drink but the enticement to drink, for governments often draw their revenues from the trade, and the shareholding public are banded together in a secret fellowship to promote it.

Or take the case of the offender against chastity; where can we place him where the same crime does not prevail in a hundred forms open and secret? Where can we remove him out of the influence?

Again, how can we deal effectually with the thief when misappropriation, in various forms, is so universally prevalent? In short, whether

it is the child or the criminal, we find we cannot control them because we have not self-control ourselves. The existence of these undesirables is our deserved penalty; and in our efforts to deal with them we may learn the necessity of dealing with ourselves.

Criminal lunacy is but the culmination of a continuous process of loss of self-control. The criminal lunatic was perhaps once like we are now; some day we may be like him. The propensities ever grow by indulgence and the will weakens by relaxation. If we do not succumb in our life-time, there is the next generation to think of; what of our descendants, who will begin where we left off and continue the downward process? And we ourselves live again in posterity.

Often people tell us that degenerates have no conscience and sense of responsibility, but this may only mean that people have been unable to awaken it in the degenerates. It may be there all the time awaiting a call from one who is able to evoke it. But how can we appeal to the Soul of a man when we do not ourselves realize that man is a Soul and have no faith in our own higher nature? A man having such faith in his Higher Nature and in the Higher Nature of others can appeal to natures that remain quite unapproachable to ordinary means.

It is the duty of everyone, then, to cultivate the principle of self-control in himself, thus fitting himself to become a teacher and helper in whatever sphere he may be cast; and to learn all he can about the nature of man by study and practice of Theosophical truths.

STUDENT

### Lord Kelvin

ALL the notices of the late Lord Kelvin have remarked the uncommon manner in which he combined in himself the usually opposed qualities of a great abstract thinker and those of a practical inventor. To him are due on the one hand many abstruse theories as to the constitution of matter, and allied topics, and on the other hand many useful inventions and practical methods.

This all-round man said at his Jubilee in Glasgow:

One word characterises the most strenuous of the efforts for the advancement of science that I have made perseveringly during fifty-five years. That word is failure. I know no more of electric and magnetic force, of the relation between ether, electricity, and ponderable matter, or of chemical affinity, than I knew and tried to teach to my students of natural philosophy fifty years ago in my first session as Professor. . . . [But] what splendid compensations for philosophical failures we have had in the admirable discoveries by observation and experiment on the properties of matter, and in the exquisitely beneficent applications of science to the use of mankind, with which these fifty years have so abounded!

And in 1903 he said:

Forty years ago I asked Liebig, walking somewhere in the country, if he believed that the grass and flowers which we saw around us grew by mere chemical forces. He answered: "No, no more than I could believe that a book of botany describing them could grow by mere chemical forces." Every action of human free-will is a miracle to physical and chemical and mathematical science.

Thus we see that he clearly recognized the limits of discovery through physical methods,

and that the business of physical science is applications, its theories being not finalities but representative formulae for the purposes of practical inferences. To understand the action of human free-will, or that of the will that makes the plants grow, we must study *mind*, not physical matter; that is, it is a question of a higher science—the science of self-knowledge.

Kelvin had a dispute with geologists as to the amount of time required for cosmic processes; his theory of the earth's age, based on thermal calculations, not allowing them as much time as they demanded for geological purposes. But now the discovery of radioactivity has introduced new factors into the calculation; and who shall say what still newer factors may not be introduced at any time? However accurately Kelvin may have reasoned from the data at his command, there were other data that he did not know of. The very strictness and accuracy of a line of reasoning is often due chiefly to the narrowness of its scope; or in other words to the limitations of the premisses from which the reasoning starts; as for instance incomplete knowledge of internal and external heat-sources, of cyclic ebbs and flows, of inter-etheric life, of the noumenal side of matter; what mind is so spacious as to take into account *all* the possibilities and overlook none?

T.

### A Real Pocket Library

THE (French) Bulletin of the International Institute of Bibliography propounds what looks like an admirable idea. It is that the large pages of our books should be replaced by micro-photographed diminutives, an international standard of size being adopted. They would be read through a magnifying lens. Anyone therefore armed with the official glass would be able to read any book whatever that was thus produced. It is said that there are no technical difficulties in the way and that the present cost of printing books would be lessened to one sixth. The plates would be fireproof and almost eternal, and an edition could be slowly enlarged to suit the changing demand. The danger of our great libraries growing till they become past all possibilities of housing would be indefinitely deferred. And a traveler could carry forty or fifty of his favorite books with him in odd corners of his grip—if there are still travelers of such tastes.

### Ancient Surgery

IT appears that the Bailiff of Balbroun, a worthy knight who lived about 1560—heaven rest his soul!—lost an arm in some way that history does not record. He was buried in due course under the altar of an old church in Alsace. His tomb has just been opened and it turns out that he had his fleshly arm replaced by one of steel so complicated and so well fashioned that it would do credit to any modern instrument maker. It had all the necessary joints and was provided with many springs, the thumb having one to itself. These were brought into action by means of a knob in the palm of the hand, enabling him to wield a sword and the implements of eating. That was three centuries ago and the artificer who thus cunningly served him does not appear to have transmitted the art. So it had perforce to be re-invented in our own time.

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

**Vol. I treats of Cosmogogenesis**  
**Vol. II treats of Anthropogenesis**

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

### Putting Back the Clock

WE may put back the hands of the clock, but the course of the sun and the true time of day are not affected thereby. Ecclesiasticism is at present trying to put back the clock, so that people may not know the sun is so high in the heavens. This is no new thing; it is an essential feature of ecclesiastical history since the fourth century. The late Papal decree devoted to the condemnation of progressive thought, and taking means to prevent priests and people from reading progressive literature, is an interesting document; and it should serve to make certain things stand out in clear light. It is a milestone reminding the man who is moving along the path of progress of the distance he has traveled. It is also a reminder to the world generally that the Roman Church has not moved at all, or but very little, for it *has* moved. Is it not setting about a revision of the Vulgate? This itself is a curious fact coming as it does along with the Papal decree against progressive thought. But the standard bible of the Roman Church, the Vulgate, is being revised — not by any unholy critics, but by men appointed by the Vatican itself. Still, this is something to be thankful for — the Vulgate needed revision, and is being revised.

#### Vatican Revision

One is carried back in thought to the early centuries when there was no Vulgate, but only the *Old Latin*, and texts formed from it. This *Old Latin* was an African, and not an Italian translation, as one might suppose; the fact being that Greek, and not Latin seems to have been the prevalent language of the early Christians in Rome. Then Jerome set about making a better translation. Now, while Saint Jerome was, in many respects, not the sort of man one would expect a saint to be, yet he deserves credit for making the Vulgate. But in those days, as now, people did not like to change, even for the better, and Jerome's version for a time, met with much opposition, just as the present Revised Version is opposed by some people. In the course of time, however, the fairly correct character of the Vulgate gained for it a chief place; so the version which had been condemned, became, in the eyes of the Church of Rome, as sacred as the Greek original, or more so. Now it is going to be revised — though we must not infer that it has come down through the ages without some change. The Sixtine and Clementine revisions are well known. The present revision has really been forced by the advances made by

modern scholarship, though the Papal decree attempts to decry independently progressive thought.

In this connexion one must not forget Cardinal Ximenes, a greater man than Jerome, and his life-work in producing the Complutensian Polyglot. And it is pleasing to remember his charitable spirit towards Erasmus who was with great haste forcing his New Greek Testament through the press in order to forestall the great work by Ximenes. It is but fair to call to mind some would-be Reformers within the Roman Church itself. The real lover of truth and progress hails those who strive, or who have striven for truth, no matter where they may be found.

#### The Advancing Force of Truth

There are some would-be Reformers now in the Roman Church, hence this Papal decree to put back the clock, to prevent both priests and people from having any thoughts and from reading any books not hall-marked at the Vatican.

It is part of the great purpose of the Universe that progress comes about as the result of exertion. A modern writer says: "Conflict and difficulty are essential for our training and development, even for our existence at this grade. With their aid we have become what we are; without them we should vegetate and degenerate; whereas the will of the universe is that we arise and walk." Our powers are meant for use. We have eyes that we may see, and minds that we may think. When we are young we are carried, but after that we must walk for ourselves, and think for ourselves. Nature makes her meaning quite plain here; for disuse of a limb or a faculty means loss of power, or atrophy. But thinking is not always easy, and in all ages some people have had others to think for them, the natural result being that they gradually lost the power of genuine and robust thought.

#### Padlocks on Mind and Soul

People of this class will always belong to the most conservative and backward church or cult of the time. Indeed, as the demand creates the supply, they call into existence creeds, dogmas, and the like — whatever lulls their conscience, puts their reason to sleep, and assures them easily of happiness here, and heaven hereafter. It saves one much trouble, and a great deal of worry and responsibility.

The late Papal decree will save much thinking. It will make it an easy matter for the faithful to know what to read, and what to think: what to believe, and what not to believe.

And a mental Inquisition will doubtless be put in full swing again; there will be a committee in every district. We may be quite sure that in such case certain penalties will not be lacking. Already, it is reported that a certain priest may be barred from preferment in California on account of his liberal tendencies. The Vatican still breathes the air of the Middle Ages, and appears to be trying to put back the clock to that period.

The Papal Bull is too long to quote at length; but a few of its sections will serve to show its nature:

3. The faith proposed by the Church is opposed to history and Catholic dogmas are irreconcilable with the true origins of the Christian Religion.

This the Pope condemns.

5. As only revealed truths are contained in the deposit of faith, it does not belong to the Church under any circumstances to pass judgment on natural sciences.
11. Divine inspiration does not guarantee all and every part of Holy Scripture against error.
21. The revelation which constitutes the subject-matter of the Catholic faith was not completed in the Apostolic age.
41. The sacraments have no other purpose than to recall to the minds of men the ever-beneficent presence of the creator.
56. The Roman Church became the head of all churches not by divine ordinance, but by purely political circumstances.
57. The church has shown herself to be an enemy of natural and theological science.

What  
does it  
Mean?

All these are condemned, together with about sixty other "advanced views" which the Vatican cannot tolerate.

From the number and character of the views which the Pope condemns it is manifest that there must be a large and growing element within the Roman Church tending towards modern thought. What does this portend? Does it mean a supreme and perhaps final effort on the part of ecclesiasticism to keep its hold upon the lives of men, and to hinder the progress of free thought? Such attempts have been numerous in the past, both in regard to science and theology; and the Church, in the end, has always had to move along somewhat, borne by the advancing wave of knowledge. It serves to illustrate the majestic course of truth, that while this Papal Bull is being issued to oppose independent thought, close to the Vatican itself are some eminent astronomers who now teach as a matter of every-day knowledge those facts about the solar system which the Church some time ago condemned. So the world moves by virtue of a purpose high above all human enactments.

Part of a  
Concentrated  
Plan

It has been suggested by a famous writer, formerly a member of the Roman Church and one of its authorities, that the present move is the result of a combination between the Franciscans and the Jesuits, in order to concentrate all power within the Church into one point. Such may be the object aimed at, and there is no doubt a certain worldly wisdom in it; but it leaves out of account the great fact of all: that TRUTH is mightier than all

schemes and policies; and that he who sets himself to hinder the march of TRUTH must fail.

The more principles are carried to their logical results the more apparent their character will be. We may be in doubt about the tiny seed, the small beginning, but when it has developed fully into a stalk of wheat, or into a weed, then we are no longer in any doubt or uncertainty.

What the Church of Rome has been in the past all do not know; and many who do know forget; and even those who do not forget may be tempted to "let the dead past bury its dead," and to trust in better things for the Church now,

"Semper  
Idem"

and to hope for better things in the future. The present action of that Church sadly weakens any such trust and hope. When the seat of authority in things spiritual is placed outside of the Christos within man, and is made to consist of an infallible man, or an infallible book, a seed of evil has been sown, and the result will be bitter.

For those outside of the Roman Catholic Church it may not seem to matter very much; but it does matter, for as members of the same great human family, one member cannot suffer without others being affected. The Papal Bull has probably a political bearing, and the more advanced countries in Europe will be most affected; as will also be the great American continent, both north and south. It therefore behooves all who have the welfare of humanity at heart to be very watchful, and carefully to examine all the signs of the times in order that the Cause of Truth may have as few hindrances as possible, and that the Divine Will may be done on earth as in heaven: and that Will is ever tending to the growth of light, the advancement of liberty, and the perfecting of human development.

(Rev.) S. J. NEILL

### Science and Poetry

A CHEMIST recently remarked that the reign of poetry was now over; that of science begins. The emotions, so he thought, must wilt under the hot sandstorm of facts. We cannot make-believe that there is a soul in nature when we know her rigid frame of law.

The Paris *Figaro* recently published a posthumous article from the late French astronomer Jansen, maintaining that poetry and science represent "the two grandest manifestations of the human spirit," and that instead of the time being ripe for the disappearance of poetry it is ripe for its "beautiful and fruitful alliance" with science, each as the interpreter of the other.

The poets require to see that nature is *beautiful*; and most of them require to see that she is *ensouled* and therefore spontaneous as well as ruled. Why the knowledge of more facts, which is science, should disappoint either of these requirements, is not easy to understand.

The poet finds the tree, as the common eye sees it, beautiful. He learns from science that it is radio-active—which is not a poetic-sounding word. But what does it mean? This: that the tree is radiating a clothing-sheen of most delicate trans-prismatic colors!

He finds the shades of green beautiful. Sci-

ence tells him that the veins of the leaves are closely raimented with a mosaic of tender green and transparent cells, the disposed contents of each of which, if sufficiently magnified, are as beautiful as the whole tree, and moreover very mobile.

The cells are made of molecules, which, if falsely considered as hard dull cricket-balls, are certainly depressing enough. But every molecule is a solar system of shining planets of electric light in the swiftest motion amongst each other, with dawns and sunsets and nights, and making an etheric music as audible as that of the spheres of the sky. Color, after all, is only sound seen, etheric sound. The word etheric is science; take the sister word etherical and you have poetry.

The poet knows something of law already. He knows that the tree becomes green in spring. He knows that his own life-currents run faster and higher than. But so far from being depressed by that much knowledge of iron law, he makes it the theme of some of his poetry. What should there be in further knowledge of law to depress him? He knows that his own body and even mind are governed by "iron laws." But he knows that it is through and by means of and because of those laws that he has his free life of thought and feeling and his royal moments of inspiration. He knows that it is precisely because of them that he may grow, spiritually and mentally, from his birth to his death. They safeguard his divine progress. What could he do in a world of idiot atoms and cells that ran themselves without law, order, or plan?

What hinders that he shall now look at the tree and see it as an ensouled being slowly passing year by year up the scale of nature, passing from the dimmer to the clearer in consciousness, growing humbly perhaps but divinely by means of the laws which he knows are the necessary conditions of his own progress? What hinders him from seeing some amount of consciousness and some minute growth of like kind even in the very "planets" and "stars" that flash around each other in the hidden life of the atom? They too are under law; they have not spontaneity in the sense of untrammelled idiocy. But it is perfectly open to him to assume that underneath their frame of law they have their minute yet appropriate degree of conscious spontaneity.

If the scientist chooses to paralyse his soul in the direction of poetry and imagination, he is welcome to do so. But after he has done so to the last possibility of completeness, every fact which he has grubbed out of nature can be joyfully taken by the poet and—not ensouled or adorned by him but—seen in its ensoulment and natural adoration. And when the grubbier denies the soul, denies its spontaneity, denies the divine plan working out through the laws, the poet has only to remark: My friend, you are deserting your grub heap. Beyond its limits you have no jurisdiction. I know the soul of nature because I have taken the necessary steps to do so. I can get the gold from the pile which you have so usefully accumulated for me. Many thanks. In some other lifetime you may perhaps do better for yourself. But poetry and science should never be thus separated, for each has elements that are necessary to the other, and Wisdom includes both.

## Some Views on XXth Century Problems

### Dynamic Helpfulness

A PROBLEM which is agitating London just now is that of how to feed the thousands of children who go to school without any breakfast, and often to bed without supper. It is a difficult problem. Many workers who contact the life of these children closely are for feeding them out of the rates; others, whose imaginations are less lively, as is often the case when one's own stomach is full, are not in such a hurry and look at the economic side of the question. If the children are fed out of the rates, the pauperized class of the community will be increased; there will be an incentive to careless parents to neglect their duty; and poor people will have to pay for the feeding of their less thrifty neighbor's children. So these latter authorities are in favor of leaving the matter to charity or special funds. The question will probably be settled for the immediate future by some compromise.

People weep when they hear of these perpetual tragedies, but their pity does not take an effective form, because they do not know what to do. The cause of these evils is of course selfishness — everyone must admit that. What then shall we do? Go seek to eradicate selfishness from our neighbor?

If we had a philosophy of life worthy the name, we should know that he who fights selfishness in his own nature lessens the total of selfishness in the world — not merely in the obvious arithmetical sense, but by the action of his spiritual aspiration along invisible lines of action. But we know nothing of these higher planes of Nature. We know about the ether and how electric action can go across the earth, but nobody has taught us how our own motives and aspirations exert a far more potent influence than electricity.

Then people cry out because they see no opportunity to help. But it does not do to wait for opportunities; opportunities are with us every moment, and we neglect them and call for greater opportunities; the prospective duty always seems easier than the duty of the moment, till it in its turn becomes the duty of the moment and is likewise neglected. If we discharged our duties as they came, and seized little opportunities, greater ones would open out.

Do you want to help? Would you not like to be in the place of power where your wishes would be mighty levers to move mountains? Then know that the place of power comes to him who faithfully discharges the duties of the moment and seizes the little opportunities; everything makes way for him; his sphere enlarges and enlarges; his hands are full; he is doing all that one man can do to help.

But most people propose to go on living their old life — careless perhaps, self-indulgent, indifferent, purposeless; and hope the voice of pity may be assuaged by some charity or effort that will not interfere with that proposal.

There are plenty of mere people in the world, and what is wanted is Men and Women in a truer sense. The Man or the Woman is

worth more than thousands of ordinary people, such is their dynamic power and their influence wherever they go. Should we not then set about cleaning up our own house and determine to enter upon that path that will make us powers for good in the world? Is not that the rational way to cope with evils?

Then we must strive to find out the roots of selfishness as manifested in our own nature, and grapple with them there, where our power of action lies; and this will lead us on to opportunities of dealing with that evil on a larger scale. Yes, it is because we are tied hand and foot by our own selfishness that we are so powerless to help. How can we move the hearts of multitudes and set the world aflame, if we allow ourselves to be daily victims to those very forces of selfishness, indolence, and lust that are causing the evil in the world?

It is open to everyone who feels the voice of pity and is sure that it is not a mere superficial sentiment but comes from the heart, to decide whether he proposes to let that voice go unheeded or whether he will listen to its urge to mold his own life on lines of beneficence, self-mastery, and duty.

Jesus in the Gospels is represented as teaching the life of holiness, but we have made it into a life of *personal* holiness for the benefit of our own soul, the safety of our future existence, and the gratification of our own self-righteousness. Did Jesus want saints? It would seem easier to imagine that he wanted workers. The object of holiness is that we may become powers for good in the world and help the people we say we pity.

But narrow theology has kept back from man the knowledge that his religion ought to give him. It has represented that the reward of right living is eternal happiness in heaven and has denied man the prospect of ever becoming anything on this earth. Hence poor man does not believe that it will do much good for him to reform his own life; he does not want to be a spiritual grandee, and is not much interested in the question of heaven. Yet Jesus taught that great actual powers should come to those who followed his doctrine.

Theosophy comes to revive the lost teaching of the world's Saviors and to show man once again that he is a potential God and that he is his own savior by virtue of the Divine Spark in his clay. It teaches the efficacy of efforts, and proclaims that self-mastery is the path to self-knowledge — not a mere ladder to the golden city. It declares that dormant within man lie faculties and powers far beyond the feeble glimmer of the present intellectual faculties and the uncertain statements of religion. These higher faculties will be opened to the one who has the pass-key — self-mastery; spiritual powers cannot be used by the selfish.

But even here the innate selfishness of human nature may crop out and make one think of powers for self-glorification or personal advantage. They will grow only in the constantly tended soil of the desire to help, even

the indwelling Divine Being sought in order to afford its light a channel outward into the world. STUDENT

### Innately Known Psychology

DR. BERNARD HOLLANDER, president of the English Ethnological Society, recently operated surgically on the heads of two boys, both of whom had been injured in some way and subsequently to the injury exhibited very marked criminal tendencies. With the relief to the results of the injury the criminality disappeared. The cases excited great interest and the operator has made them the text of an address on crime and responsibility.

But he left the matter very much where he found it. Like most alienist pronouncements, this one started from a false psychological basis and therefore reached nowhere. And yet the very words used implied the truth, indeed exactly stated it. He said, for instance: "A man might be fully conscious, have no delusion, know the nature of his act, and yet be incapable to control the mad impulse of his deranged mind." The implication is that the normal man can control the impulse and the mind from where it arises. But the controller cannot be identical with that which he controls, in this case with mind and impulse. The duality of human consciousness is in the *words* the alienists use, yet they let it drop from the *argument*. If pressed they say that they are compelled to use words with that implication by the exigencies of language. They are, however, really compelled by the exigencies of *fact*, by the immediate knowledge which every normal man has of himself. He knows that he is constantly in the presence of impulses, thoughts, and currents of feeling which he can control, accentuate and dispel, to the extent that he has practised doing so. He has been so long accustomed to regard himself as identical with these, whilst at the same time knowing his non-identity, that he has almost lost the real art of life. And when he speaks he uses phrases meant to express one thing which really express the other and the true one.

Considering the two elements, the impulses, thoughts, and feelings: and the man himself, it is clear that if the latter has never in any way or degree exercised the art of self-control, he is at the mercy of the latter as they are of the physical condition of their instrument the nervous system. At the other end of the scale is the perfect man whose thoughts and impulses are absolutely in control and are dependent not for their *direction* but now merely for their *vividness* and power upon the physical condition. Men range up and down between these extremes; and the real and highest education of the child consists in teaching him the fact about his own nature, its duality, and his consequent power and duty to dominate. There is no difficulty about this education, for it corresponds to what the child feels of and in himself. Education is in fact the awakening of true self-consciousness, and that awakening brings with it the power that belongs to it and its recognition of its divinity. STUDENT

## The Australian Aborigines

REGARDING the "Papuan, Melanesian, or Australian aborigines," we read that they exhibit certain peculiarities not found in the African negro, to which race they otherwise present some similarity. The forehead is higher; the under jaw less projecting; the nose, though flat and extended compared with that of the European, less depressed than in the African; the lips thick, but not protuberant; the eyes sunken, large and black. The color of the skin is lighter than that of the negro. The stature equals that of the average European; the body and limbs are well shaped, are strongly jointed and highly muscular, and the heel is straight. The natives of the Australian continent have straight or curly black hair.

They have much acuteness of perception for individual objects, but little power of generalization; as when a language has no general terms for tree, bird or fish, though every individual species has a separate name. The grammatical structure of some of the North Australian languages has considerable refinement; *the verb has a variety of conjugations, and expresses nearly all the moods and tenses of the Greek. There is, as in the Greek, a dual form as well as a plural in all declensions.* Words are declined by terminal inflections. There are words for one, two, and three; but four is expressed by two-two, five by two-three, and so on. The number and diversity of separate languages, not mere dialects, is bewildering; tribes of a few hundred people, living within a few miles of each other, have often scarcely a phrase in common.

They are considered as all belonging to one stock; and there is a theory of their having landed in canoes from the island of Timor and diffused themselves over the mainland. The natives of the northeast are far superior in mind, body and social habits to the rest, bearing most resemblance to their neighbors in New Guinea.

In a general view, two or three "extraordinary defects" exhibit themselves. *The natives never reared any kind of cattle, nor kept any domesticated animal except the dog.* They have nowhere built permanent dwellings; they have neither manufactured nor possessed any chattels, beyond such articles of clothing, weapons, ornaments and utensils as they might carry. They are tattooed. Their dwellings

Lomaland Photo. and Engraving Dept.

AUSTRALIAN "BLACKFELLOW" USING THE FIRE-DRILL

are bowers of branches or hovels of logs. They use the spear and axe, and the boomerang is of course characteristic.

Now observe how the facts, so puzzling to ethnologists, bear out the scheme outlined in *The Secret Doctrine*. In Australia, as in America, we find a wonderful variety of peoples and languages, yet all grouped together by a few common characteristics which differentiate them markedly from the races typical of other continents. How is this unity in diversity to be explained? That has been the problem for ethnologists. The answer of *The Secret Doctrine* is that they spring from a race extremely ancient in its origin and isolated for long ages. Thus has the essential type been preserved while minor divergences have grown wide.

The Australians—or, at least, many of them—are descendants of the seventh sub-race of the Third Root-Race, that Root-Race to which

H. P. Blavatsky has applied the name invented by Sclater—Lemurian. Lemuria flourished and ended her career some 700,000 years before the early Eocene Age. The reality of the continent in the Southern Ocean, of which the islands are remains, is admitted by geologists and has been discussed before in this Review.

We must not be too hasty in our desire to generalize or in speaking of the Australians inclusively, for after so many ages there may be particular cases to which general remarks do not apply. But, regarding the low types, we are told that they, in common with other such types on the earth, are descended from a part of that ancient Third Race which went astray on the path of evolution and took a downward course. Thus was originated a race of a low type, and it was ensouled by Monads who were "not ready" to receive a full measure of the Manas, but received "only a spark," so that these Monads are a stage further back than the more advanced ones now on earth and will only be able in this Manvantara to acquire enough intelligence to place them, in the next Manvantara, on a level with the present status of the higher types of humanity. We must distinguish the race from the Monads that ensoul it. The race is degenerate and dying out; but the Monads are merely as it were "baby Egos," without any accumulation of past Karma to work off, and thus, as *The Secret Doctrine* says, luckier than

some more intelligent races.

A writer named Gerland is quoted in *The Secret Doctrine* (Vol. II, p. 779) as follows:

The statement that the Australian civilization (?) indicates a *higher grade* is nowhere more clearly proved than here, where *everything resounds like the expiring voices of a previous and richer age.* The idea that the Australians have no religion or mythology is thoroughly false. But this religion is certainly *quite deteriorated.*

All the facts—the elaborate grammar, the boomerang, etc.—indicate that the race is a survival, and not (as the usual theory of humanity demands) an ascending one. Nor does it seem to have followed the prescribed stages of human development—hunting, pastoral, etc.—school books please note. But, though the race is dying out, the Monads that ensoul it will pass on to higher races in pursuance of the due course of their evolution. STUDENT

# ✻ The Trend of Twentieth Century Science ✻

## What is Matter?

PROFESSOR Mezes' presidential address before the Texas Academy of Science was an attempt to spiritualize the universe for us, to free us from the dualism of mind and matter and substitute a monism of mind. The ultimate corpuscles whereof matter is built became in his hands specks of consciousness; but he did not see that he had only pushed the duality back a step.

He points out, not of course newly, that all that we ordinarily call the qualities of matter, colors, sounds, tastes, smells and the rest, are sensations excited *in us* by various fine and gross motions in matter.

Then we examine this matter, which seems so solid and weighty. We dissect the molecule and find atoms; we dissect them and find corpuscles. We examine them and find them to be electricity, points of electric charge. But can a point of electricity have mass, weight? It is found that an electric charge moving with the velocity of light (which corpuscles can) acquires in virtue of its motion the mass or weight, the attractability by the earth, which we know it to have.

So the whole field of matter consists of moving electric charges, moving in closed paths or in lines. When housed within the atom they are moving in closed paths like the planets in the solar system.

But something more is to be said of these electric monads than that they move.

It is also plain that inorganic, or so-called dead matter, has, in the way of evolution, developed into organic or living matter, and that matter is being constantly transformed into living, yes, into conscious, beings; and living and even conscious beings are being daily transformed back into mere matter.

(That last clause needs a qualification.)

These plain facts of themselves throw not a little light on the nature of matter. For they show that the constitution and the nature of matter must be such as to allow of the development and interchange discovered. Matter cannot be very dead, it cannot be blankly non-conscious, it would seem, if everywhere and at all times it is, in the ordinary routine of the world, nourishing and stimulating life and consciousness. . . .

A corpuscle, then, is an electric activity. It is also a point of consciousness, a rudimentary mind; and, when numbers of these are sufficiently aggregated, first into atoms, then into molecules, then into cells, and these into organisms with organs, the mind side of the aggregation becomes very obvious. Consequently when we look upon the world and get sensations, it is a case of (man)-mind looking out upon (nature)-mind. So, considering the corpuscle as a unit of activity with a subjective side, or rather, a unit of subjective activity which presents itself to us as objective, the Professor says:

Probably the contribution of evolutionary theory to our knowledge of mind that bulks larger than any other is the discovery, growing clearer with each year of study, that the human mind is also fundamentally just a group of activities, greatly compli-

cated, mysteriously unified, wonderfully resourceful, marvelously progressive, self-conscious moreover, and free, and yet at bottom a system of activities, no more.

Here is the dualism quietly introduced. "Self-conscious" — *can* "just a group of activities" be *self-conscious*? The self is the witness and unifier and employer of the group, its soul. And when the group disintegrates, this soul, with what it has gained from the incarnation, passes into another. *It* is not disintegrated "into mere matter." There is a "soul" in the center wherever there is an aggregation, from the molecule upward. But until the human stage this soul is not *self-conscious*, not conscious of its *selfness*. For *that* consciousness to awaken it must be touched by a Divine ray. Then it is man, who though nature-living, is not, as man, nature-born.

## The Earth's Circulations

THE manner in which the veins of ore have been deposited in the earth's crust is still a moot point in geology. It is connected with several radical questions still unsolved. How, for instance, came the oceans? It is usually considered that they condensed from the clouds of steam that surrounded the young planet. But some geologists think that they emerged from the depths of the crust by way of volcanoes. We know that active volcanoes do vomit steam in vast volumes.

The ocean question is involved in the ore-vein question. For the newer view of ores is that they are deposited from below. The older view makes the surface waters, on their way deeper, dissolve metallic particles from the rocks in the superficial crust layers.

But this theory does not explain the presence of ore-veins at depths much greater than this descending water reaches; it does not explain how so much metal remains undissolved by the passing water; and it does not explain the fact that some springs appear perfectly independent of the local amount of rain. Says the geologist Mr. J. F. Kemp:

All familiar with western and southwestern mining regions know as a matter of experience that the metaliferous veins are almost always associated with intrusive rocks [that is, rocks which were intruded in a molten state from below] and that in very many cases the period of ore formation can be shown to have followed hard upon the entrance of the eruptive.

So the newer view is that the molten rocks, forcing their way up from far below, carried with them — not water, but the elements of water, hydrogen and oxygen as yet unassociated, and the elements of acid gases. When these got near enough to the surface to be cool enough to associate, the resulting hot water (owing to the pressure, far above the temperature of boiling) dissolved the metals from the intruding column in which it lived, and when in rising it got cooler yet, deposited most of what it held in solution. The veins are therefore deposited from water coming up from *below*, mainly, and only to a much small-

er extent from water coming *down* from the surface.

May there not be a complete circulation of some kind? It is pretty well known now that every metal — and indeed every element — is not only volatile to some minute extent, but is radiating its substance into electrons. These, liberated at the surface, would be carried by the earth's magnetic currents to the poles — how far in, there, we do not know. On the other hand, the intrusive rocks, reaching the level of the underground water, are constantly being deposited on the surface by means of springs and volcanoes. And these rocks may be integrated at still deeper levels from some more elementary matter of which we yet know nothing. In fine, the circulation may be from the very interior, even ultimately from the center, to the surface, and then in again at the poles.

There is also of course a very much more superficial circulation — from the *atmosphere* to the crust and back again. For example a fiftieth part of the atmospheric carbon is annually taken into plant life and returned therefrom. And the nitrogen, by the action of electricity, passes into nitric compounds and is washed down — ultimately to return again. In addition to which we annually incorporate 20,000 tons of matter from space — from the sun and from meteorites.

## Photographing Character

THE graphologists are evidently going to find themselves utterly outdone. Recent invention has made it possible to plot off on smoked paper, as a curved line, the exact melody of the vowels of words spoken into a phonograph. The tremulous curve of the melody of one vowel can be spread along upon a yard of paper and its minutest inflexions examined.

In a very general way, the melody picture of the same vowel is the same for all speakers of it. But there are variations of this general line of tone according as the vowel is used in interrogation, surprise, grief, deprecation or despair. Two persons using the same vowel with the same expression, for example astonishment, will give different lines. And lastly the same person at different times, although trying to give the vowel the same expression, will give different lines. The consonants of course, except the fluids, give no melody curve; they only interrupt that of the vowel preceding.

These pictures are therefore not only pictures of prevailing mood and of momentary feeling, but of character. No one has yet tried to examine them in that light, nor to study them as health pictures. But that will not now be long. The voice will be found the most faithful and undisguisable reflex of character. Training it will not help in this connexion. Whoever wants to make his character look better on the smoked paper will have to take the trouble to better it in actuality. Science is getting so inconveniently inventive!

Applicants for posts must look out. C.

IN the southern part of Limburg, the most southern province of Holland, are found the only rock formations in the country. They include the St. Pietersberg and those at Valkenburg and the neighborhood. In some of these rocks are cut cave-dwellings as homes for the very poor.

## The Eucalypts—Nature's Laboratory

“THE Eucalypts of Australia” is the title of a paper in the *Scientific American Supplement*, which is abstracted from the *Journal of the Society of Chemical Industry*. This paper calls attention to the fact that Eucalyptus trees are now being planted in parts of America, and in South Africa, India, Algeria, Italy, and other places, chiefly with the view of supplying hardwood for railways, and also with an eye to the development of the eucalyptus oil industry and the possible creation of an industry in bark for tanning.

There are not less than 200 well defined species of eucalypts in Australia, the greater number of which have been chemically investigated; but very few are familiar to people in other countries, and it is for this reason that *Eucalyptus globulus* has obtained so wide a reputation, many seedsmen not knowing of any other kind. But now one planter in America has 900,000 eucalyptus trees in his forest, among which is not a single specimen of *E. globulus*. In Australia gigantic eucalypts occur, one at Marysville in Victoria having a circumference of 70 feet and being 150 feet to the first branch.

The known constituents of the several oils number about thirty, but they do not all occur in the product of any one species. It has been found that the presence of the different constituents is indicated, in the most important cases at least, by the peculiar venation of the leaves—a characteristic distinction between the various species. Three of these constituents are *pinene* (chemically a member of the terpene family), *eucalyptol*, and *phellandrene*; and, the predominance of each of these being accompanied by a characteristic venation of the leaf, the genus is thus roughly divided into three main groups.

Economy could be practised by eliminating those species which are comparatively useless and by taking advantage of two facts—namely, that young trees yield an oil having the same constitution as the mature tree and often give a large yield; and that when the trees are cut down, fresh shoots readily grow. Hence, when the plantation has reached a suitable age, it should be cut and distilled.

The oil from *E. Macarthuri* contains a large amount of *geraniol* and has thus a value for perfumery; it never contains *eucalyptol* or *phellandrene*, so it can hardly be adulterated with other kinds. The young shoots contain a larger percentage of oil than the trees, and it is of the same kind; so the shoots can be

Lomaland Photo. and Engraving Dept.

GROTIWONINGEN, OR ROCK-DWELLINGS, PROVINCE OF LIMBURG, HOLLAND

cut down by machinery, and used, a fresh growth readily appearing.

*E. Staigeriana* is another kind that might be cultivated, as it yields an oil that could be used instead of lemon for flavoring. It smells of lemon, and not at all of ordinary eucalyptus oil; and contains *laevo-limonene*, whereas lemon contains *dextro-limonene*.

*E. citriodora* contains the aldehyde *citronellal*, useful for scenting soap; its oil is practically constant in composition wherever it is grown—a characteristic of the Eucalyptus genus, each species of which is remarkably faithful to its own characteristics.

The *eucalyptol* species is the most abundant, and this constituent occurs in the oils from most eucalypts. It is valued in medicine, although it is not settled yet which is really the most valuable constituent for medicinal purposes.

So many more interesting aromatic constituents are described that the Eucalyptus genus seems to be Nature's manufactory of balsams; and undoubtedly the scientific use of this tree has a great future before it. STUDENT

## New Plants for the United States

THE enterprise of the National Agricultural Department in scouring the world to collect new plants for adaptation in the United States is indeed great. Students of the natural history of past ages have so far almost ignored Man as an agent, for with them Man is only a very recent mammal. But those who believe in the antiquity and past greatness of the human race will surmise that Man must have played a considerable part in past ages, as now, in modifying the fauna and flora of the globe.

During the past year, an agent of the Department has explored the little-known regions

of southern Siberia, the border of Manchuria, the arid mountains west of Peking, and the fertile country between Peking and Hankau; and has sent to the United States over a thousand living seed and plant specimens for trial. Another agent has brought seeds of the yellow-flowered Siberian alfalfa, and they are being tried with promise of success in the northwestern States. Tooten clover from Norway, which is extremely hardy, is being tried in the Dakotas.

Rice in 46 varieties has been introduced from different parts of the world into the South, among them the 100 day rices—early sorts which in Japan give crops when ordinary rices fail. Young stock of Oriental and Egyptian matting plants, essential in the matting industry, have been secured; and a new variety of alfalfa, that will grow through the winter in some of the southwestern States, has been introduced from Peru. STUDENT

## “Magnetic Wells”

THE Geological Survey, after examining several alleged magnetic wells and springs, comes to the conclusion—whether rightly or wrongly time will show—that there is no truth in the belief that the water itself can be magnetic or can magnetize objects immersed in it. The iron casings of wells are often magnetic, usually only sufficiently so to hold up small nails, but sometimes strongly enough to hold up bolts and spikes and to interfere with the use of a steel measuring tape. In other cases there is magnetic ore about. So it is considered that the phenomena are due to magnetic induction, and in part to previous magnetization of pocket-knives, which is common; and that the phenomena would not occur if the water were tested at a distance from the well and with objects proved to have no magnetism. E.

And the supremest quality: the virtue of virtues, is Compassion. It is "the Law of Laws".—Katherine Tingley

**B**ETWEEN the lines of the sympathetic account of Mme. Guyon, as given on the opposite page, the Theosophist can read what is the difference, the real difference, between life and life. One builds out of that rare and priceless material which is of the essence of experience and vicissitude a Temple of Compassion, not made of hands, and which is life's only crown and glory. Another does not. Therein lies the difference, clear as day to one who knows and loves humanity, though of course unperceived by those who have never wished to break the bonds of personal aims and desires.

And yet, what else is life for? Where otherwise lieth its purpose? How otherwise can the daily panorama be thought of as worth while? What a mockery it is, after all, that wasting and errant procedure that so many call "living"! Unpack the brain of its load of information and facts, strip the physical of its finery, and, in the majority of cases, what have you left? The ten thousand stand divested, bundles merely of the lighter emotions and swarming desires. The one, only, rises like a steady sun above the horizon, clothed in the golden glow of the heart-life, because Compassion has been kept as the lode-star, the building-stones, the architect, the all. Ah — there is a difference, indeed!

Where many would have grown bitter under crushing pressure, this gentle French Mystic grew tenderer, sweeter, more compassionate. It is plain that the key to soul-progress is not to be found in circumstances, as many think. These are but the many-barred gateways, the keys to open which *must be brought forth from the heart of the one who seeks admittance, if they be brought forth at all.*

What a truth is there! Yet so many who long for the impersonal life think it is only to be had through the agency of some great sorrow, some awful shock, some spiritual cataclysm or other, some wild and unnatural re-

## The Growing of a Life

nunciation like semi-starvation, living in the desert, or dabbling in some dangerous and misunderstood "Yoga practices." What fiend has smeared the brains of so many otherwise sensible people with this blight? Yet are not the victims of just this soul-mildew, the very

### TO A MOUNTAIN DAISY

On turning one down with the plough, in April, 1786  
By Robert Burns

**W**EE, modest, crimson-tipped flower,  
Thou's met me in an evil hour;  
For I maun crush amang the stoure  
Thy slender stem.  
To spare thee now is past my power,  
Thou bonnie gem.

Alas! it's no thy neibor sweet,  
The bonnie Lark, companion meet,  
Bending thee 'mang the dewy weat,  
Wi' speckled breast,  
When upward-springing, blythe, to greet  
The purpling east.

Could blew the bitter-biting north  
Upon thy early, humble birth;  
Yet cheerfully thou glinted forth  
Amid the storm,  
Scarce reared above the parent-earth  
Thy tender form.

There, in thy scanty mantle clad,  
Thy snawie bosom sunward spread,  
Thou lifts thy unassuming head  
In humble guise;  
But now the share uptears thy bed,  
And low thou lies!

essence of selfishness and decay, to be met with everywhere?

And how simple, how easy, is the real thing! It is just to take one's life as one finds it — but with this difference, that each event, each circumstance or condition, each act, shall be made to yield the heart-touch, that in each

shall the heart-appeal be listened for, that every moment shall be rich and flowing, vibrant with the consciousness of the brooding Soul, of *Iśvara*, the Warrior. It is just to distil from the little — or great — daily happenings the sublimated essence of that love which is tenderness, pity, unselfish brooding care. All the devils in all the deserts of Christendom are less potent to scare into soul-strength some hermit than would be a single glance from the warm brown eyes of some little dumb pet, so filled with gratitude and affection, to lift and strengthen one who loved life and was ready to be lifted into Compassion. And one who can feel this, whose heart beats warm because it can tell pure devotion from its counterfeit, needs no awful "tests" — though these may come too; they will be met victoriously if they do.

The twitter of a little wild bird at your door, because you didn't throw out the crumbs as you promised and which it has learned to expect — what is it that is set aglowing in your heart by that? Is it not the flame of Compassion leaping higher — and what else is this life's experience for? Sorrows and "tests" and "initiations" will do little if not met in that self-same spirit. We may learn from them — enough perhaps to avoid planting the seeds of certain kinds of errors in the future. But that is very limited knowledge and a whole life may not suffice to give us the self-protective astuteness of the criminal insane. Is it worth the cost?

We may learn to endure — but iron learned it long ago, and many a felon can outclass his unconvicted brothers in that half-virtue. And so with the rest. And so with very much of that conglomeration that in the world goes by the name of "culture." Not that Theosophy would dispense with brain-mind study. On the contrary, as the Teachers of Theosophy have always pointed out, the student must pass many and difficult tests in brain-mind know-

ledge, more difficult than anything the outer world affords, but it will be kept in its proper place. Who would build a mansion to be run by the upper servants, the master and owner turned out by them into the street?

Why not be sensible, quenching the "I" just a little, if necessary, and aim for life's center, the gold, as did Mme. Guyon, true Theosophist that she was? Why not be trusting and true and just and tender, opening the heart's door so that everything may serve as fuel to the true flame? The least among us can do as much as that. It is the only pathway to growth, the only way to the deeper knowledge, "the only sign of greatness." STUDENT

### Madame Guyon, a French Mystic of the Seventeenth Century

ON April 13, 1648, in the reign of Louis XIV, was born in France, of wealthy and aristocratic parents, the child who later as Madame Guyon became a lamp of fervent piety to that profligate age and a famous teacher of the form of Christian mysticism known as Quietism.

A religious enthusiast at twelve years of age, Jeanne Marie Bouvier de la Motte bound herself by a solemn vow "ever to aim at the highest perfection in the absolute surrender of her will to God." She had almost from infancy been under the care of one or another order of nuns, and it was but natural that she should wish to take the veil herself. But this her father forbade, and in a year or two the whole manner of her life changed. The family moved to Paris, and Jeanne Marie, having emerged from a sickly childhood spent in the charge of nuns and servants who in no wise understood her, found herself amid all the fascinations of the brilliant society to which by birth she belonged. Moreover, she had blossomed out into a very beautiful and talented girl.

When but fifteen she was married, without her wishes being in any way considered, to M. Guyon, a man nearly forty years old, whose affection for her did not take practical shape in making her happy for in his home he permitted an extremely tyrannical older member of his family, his mother, but a coarse, avaricious and cruel woman, to remain the ruling spirit.

From this time Madame Guyon's life was a series of vicissitudes which it required the greatest fortitude to be able to bear. At first, mere girl as she was, she struggled in a sort of torpor brought upon her by the change to a gloomy, uncongenial and tyrannical atmosphere, but in a few years her deeply religious nature asserted itself, and amid trials such as have permanently soured many women, this natural mystic found "the way within to the Light," and at twenty she experienced to a degree unknown to the world at large the feeling of oneness with Divinity, complete surrender to the Divine Will—the Higher Law, Theosophists name it—that inspired in her an eager renunciation of the personality and a joyous sharing of the higher purposes of earth-life. This great realization came to her on July 22, 1668 (the season of the Midsummer Solstice, by the way, was ever held as a sacred time spiritually by the ancients), and ever afterward this date was regarded by her as most significant in her spiritual growth.

Two years after this she received assurance as have other mystics of like earnestness. A poorly-clad stranger to whom she offered assistance began to speak to her about her spiritual life. He spoke as if fully aware of her experiences and of the imperfections still existing in her nature, exhorting her to persevere in overcoming, and telling her that a command had been laid upon her to do so. Mme. Guyon was aware that her advisor was *a higher order of being*, and when he disappeared, strove to retain the impression made by his message.

Through many sorrows and illnesses Mme. Guyon was sustained by what she termed "the inner light." The supreme trial was a period of seven years during which, though

tion reminds us of Joan of Arc. She utterly disarmed the trained theologian, Bossuet, by the simplicity and wisdom of her replies. She could not be convicted of heresy; but wherever she went her teachings had so much influence that she was finally imprisoned in the Bastille for four years, in solitary confinement this time, and then banished for life from Paris! In her retirement at Blois she was sought by earnest people of all ranks and many nationalities. To all she taught that while self ruled, God was as naught and the life of devotion an impossibility.

H. P. Blavatsky called Madame Guyon "the female counterpart of Iamblichus." Like the great theurgist and Neo-Platonist in the selflessness of her nature and her unity with the

Lomaland Photo. and Engraving Dept.

SAN JUAN BATTLE PARK: SANTIAGO DE CUBA

she remained as intent as before on self-surrender, the presence of Divinity seemed to be withdrawn from her, leaving a sense of terrible desolation. She persevered dutifully, however, and her inner joy and assurance returned on the 22nd of July, twelve years after her first experience of it.

After her husband's death Mme. Guyon devoted herself more intently to the spiritual welfare of all who came to her. She remained a member of the Church, but she was in no way bound by its creed or forms, and followed her own light to the extent of openly protesting against the actions of a priest whose evil intentions her extraordinary insight into hypocritical human nature enabled her to perceive.

Her "heretical" teachings, and her book, *A Short Method of Prayer*, soon excited adverse comment among the clerics, and a life of persecution was henceforth her lot. She went from place to place, saw her friends imprisoned for their beliefs, was finally shut up in a convent on the authority of a *lettre de cachet* for eight months, but was released by order of Louis XIV, who ordered an investigation of her teachings.

Madame Guyon's behavior under persecu-

Higher Law, she was like him also in the sensible view she took of psychic phenomena. She herself had many wonderful visions and dreams; she was able, it is authoritatively stated, to temper the severity of the weather; she could foretell events; but it is worthy of note that her autobiography abounds in warnings of the illusions to which such experiences may lead. Far-seeing Mme. Guyon! Hers was the rare balance of the true mystic.

Her "inner light" shed itself upon practical affairs. It led her to scorn none of the duties of her place in life as woman, wife, and mother. She excelled in common sense. We read of the confidence with which she inspired those about her. So sure were people of her disinterestedness and her ability that often her decision in legal matters was relied upon absolutely by contesting parties in a suit, harmonious arrangements being effected entirely through her. Women of the twentieth century, blest in that they have Theosophy to enlighten them, must see in Madame Guyon a noble worker, who, amid the shadows of bigotry and the temptations of a profligate age, learned to love the Higher Law and in it to abide with a beneficent tranquility. ## SANTA CLAUS IN HIS PALACE IN LOMALAND RECEIVING INTERNATIONAL REPRESENTATIVES

### Christmas Day, 1907, in Lomaland

**C**HRISTMAS Day, 1907, brought to all hearts in Lomaland a joy sweeter and deeper than these hearts had ever before known. The voices which rang out on all sides with "Merry Christmas" had a note never heard before, even in this home of peace and gladness, and every face beamed. All felt that the happiest combination of events imaginable was going to make that a memorable day.

For Katherine Tingley returned to Lomaland on Christmas morning, from her long journey in America and Europe, and when the students were assembled in the stately palace of Santa Claus which suddenly appeared in full readiness for the Christmas festival, they saw a living picture which none of them will ever forget. It was Lotus-Mother with all the little Rāja Yogas grouped around her, all pressing close to her, so happy that every heart must have grown larger to be able to hold the happiness. The grown-ups who watched this scene in silent joy realized from something in Lotus-Mother's eyes as she greeted the children that a great work had been done in spreading joy wherever she had been, and that though she had given, and given, and given from her great heart, there was more than ever left still to give—the very spirit of Christmas was there!

In this beautiful palace of Santa Claus North and South and East and West had been so blended that one felt the whole world represented, and this feeling grew as the significant scenes of the festival were enacted. One moment you would have thought you had been carried back to some stately hall in Old England where the Yule log was burning; but the

next a waving palm, top heavy with rich brown fruit, or a flaming branch of poinsettia, or most of all the children's faces and the general air of serenity brought you back to Lomaland. But I believe that those present that evening sent many golden boats laden with heart force speeding to every quarter of the globe, as the representatives of different countries, duly heralded, appeared at this international center of Brotherhood work offering greetings and gifts to the Lotus-Mother and her workers. It would have delighted you to see the old-time ceremonial observed by Santa Claus and the grace and the heartfelt gratitude with which everyone turned to greet Lotus-Mother among her Lotus-Buds.

The evening was a series of beautiful pictures from the moment when at a signal the children poured in through the arched entrances singing joyously, to the close when Santa Claus commanded his aides to dispense gifts to all and the whole palace was agog with merriment and with swiftly-passing, well-laden young helpers.

There were surprises, many of them. One was when stools were placed and the  *tiniest*  tots descended from their place close to Lotus-Mother, seated themselves sedate-

ly, and with the utmost simplicity and clearness of enunciation recited in Symposium. We are all familiar with the idea of children being "little philosophers" in Lomaland. Katherine Tingley has taught us that the little ones can respond to much higher and deeper teachings than are usually given them; but we did not yet know that from such young lips could fall with such ease and understanding the beautiful sentences which contain those teachings of wisdom needed by the world. It was evident however, that to the little ones it was the most natural thing. Each one was following the thread of the Symposium; each one had already the little Teacher within awakened and was happy to share the great thoughts that have nourished his own heart-life.

Just when every one presented thought everything must have happened there was a stretching and straining at the stage entrance and then a burst of delighted applause, as the Man from Japan appeared, leading his elephant—a most uncommonly wise and talented animal, really gifted with more intelligence than any one man has, as became evident when he responded to the orders of his guide, doing tricks and giving answers that required, one would think, a human mind. Of course the children had to have rides on the elephant's back, and it was quite in accord with the rest of the festival when this stately animal swung around with

## THE MAN FROM JAPAN WITH HIS ELEPHANT

# THE CHILDREN'S HOUR

his little passengers, directed by his most warlike *looking* but apparently also gentle keeper. These Orientals, man and beast, stayed several days in Lomaland, and won their way into the hearts of all.

So many heart-touches had been given to all the Christmas preparations in Lomaland, and as said above such a wonderful combination of events marked the day, that it was no wonder that gladness reigned. Not soon will any one who had glimpses of these preparations forget them. Every day could have been seen many groups of girls on the sunny piazzas, singing as they worked together, fashioning their gifts; tiny maids taking turns at knitting at some bright wool; busy boys whose training in handicrafts had given them the power to make many a well-wrought offering for parents, teachers, and companions. The Lomaland touch has made of Christmas giving a giving of oneself, and the skill and originality developed by Râja Yoga training finds a joyous vent at Christmastide. For weeks before Christmas the opportunity for doing gracious deeds found a glad response in the Râja Yogas, and revealed to them the season's magic.

Above all, however, what made the Christmas joy so sweet was the knowledge that the Teacher, the Warrior, the Mother, had gone forth and had returned, leaving in the hearts of those in far-off lands the healing of her compassionate touch. The joy of all those thus blessed came to swell the hearts in Lomaland at this Christmastide which was indeed an international festival. GENTIAN

cases. At one time they had to pass through a lane of stiff mud reaching above the stirrups; they did not hesitate or follow each other, but just walked straight in with a determined air as if to get it over as quickly as possible. It was done in real Râja Yoga style! Before engaging a mule, it is kind to insist on seeing the saddle off, in case he has a sore back, which would account for a "stupid mule." F. J. B.

## A New Mountain

"A NEW mountain!" This was the cry of the Râja Yoga Tots one morning in last week, when the sky was clearer and bluer than ever after the rain. Away to the north, across the bay and above the dark line of hills, rose a snow-white peak they had never seen before. How delighted they were! They are so interested to find geography out of doors as well as in the class-room on the great globe. And here was "a new mountain" right before their eyes, beautiful in all its dazzling whiteness against the sky! P. R.

RÂJA YOGAS MAKING FRIENDS WITH THE ELEPHANT

# The Theosophical Forum in Isis Theater

S a n D i e g o C a l i f o r n i a

[THE usual Sunday evening meeting at Isis Theater, San Diego, was postponed last week until the following Sunday, on account of the inclemency of the weather. Mr. H. T. Edge will resume his interesting course of lectures on the Bible.]

## Influence of the Brain on Criminology

THE influence of Theosophical ideas is permeating thought everywhere, so that we find publications which cater for the popular taste providing their readers with ideas that a few years ago would have been too bold and unorthodox. Sometimes, however, the result is curious, as in the case of an article on the influence of the brain in connexion with criminology, which recently appeared in a London paper. This is one of those illustrated journals which seem to be always strictly orthodox to the views of the day. Consequently, in an interview with a brain expert, we find the attempt to be loyal at once to popular views about science and popular religious prejudices, with a resulting mixture of incompatible views. The Doctor is represented as saying:

I consider it the most hopeful part of all my researches that they have helped to demonstrate both the existence of the soul and the possibility and probability of its continued existence after death. . . . The soul is a superstructure of the mind; and so, according to the laws of the conservation of energy, the soul is bound to go on living. We must treat the soul as the highest form of energy.

The part of the interview, however, which precedes this, is such as to give a different impression. The interviewer leads off with some loose rhetoric about all the joys and sorrows of mankind lying within that gray matter, and the issues of eternity being concealed beneath a thin coating of bone; and then:

Upon the healthy activity of the cortical layer, and its proper number of cells, depends our success in this world and our happiness in the next. Remember this, there is no separation between the mind and the brain, and the whole question of responsibility depends upon the pyramidal layer or the cortical department of the brain.

Then he enumerates different grades of energy in the human organism, beginning with muscular motion, passing upwards to nervous energy as manifested in nerve-cells, and ending with a still higher form of energy connected with the "association cells."

This is feebly represented in the lower creation, but it is a special feature of the human brain, and is connected with mind, thought, memory, emotion, ideation. The question now arises—has the Great Architect completed his work? Is he finite? Can he do nothing except what is easily understood by the human mind? The human mind is a miracle, but is it the end? We have every reason to believe it is not, because there is no science in which we have reached the ultimate goal of its capacity. There is every reason, then, to believe that there is something beyond the mind, and something built on the mind, just as the mind is built on the brain. . . .

The soul means the higher development of the man or the ego. If there is no such thing as soul, that means that we are the finality of what is falsely and unscientifically termed "Creation,"

which is an absurd position, scientifically untenable, because we know that in physical science we are only on the outer fringe of knowledge.

Then, comparing man to a seed, which requires to be nourished in order that the life in it may come forth, he concludes:

The same is true of the spirit. If a man neglects the nourishment of his soul, how can it possibly live?

In commenting on this article let us take first the ideas quoted about the superiority of the soul. It is gratifying to know that the Doctor's researches have led him to the conclusion that the soul is superior to the body and survives it, because it shows that he has been candid and logical; to no other conclusions could such researches, logically and candidly conducted, have possibly led. But one cannot overlook the fact that we are tacitly left to assume that his researches also support the orthodox theological views. No doubt unreflecting minds will be satisfied to accept this assumption and congratulate themselves that they can claim kinship of intellect with a great expert without sacrificing their religious orthodoxy. But others will be wanting to push the reasoning further. So we may ask how the researches can prove the survival of the soul without also proving its pre-existence, reminding people that the only alternative is to believe that the soul and body, commencing together, do not end together. We may also ask why, if the soul survives the mind because it is superior to it, the mind does not also survive the body; the same reasoning holds in both cases. Then, since the soul precedes and survives the mind, and the mind precedes and survives the body, we have already enough new ideas to compel an alteration of theological dogmas. The fact of course is that the doctor's admissions lead up directly to the Theosophical teachings and not to the theological dogmas.

In the first part of the article much stress is laid on the importance of the cerebral cortex in criminology. When this is sound, we are told, the man has mental and moral balance and is responsible; when it is diseased he is a criminal and reprobate, not responsible for his actions. But this cortical layer is surely nothing more than a mass of cells, fluids and fibers, in a state of continual flux, ever dying, ever reborn, as the destructive and upbuilding processes of the body go on. How then can such an impermanent thing dominate the mind, which we are told is superior to the body, or the soul which is superior to the mind? Clearly, according to the reasoning given, the disease must have its seat either in the mind or the soul. For, if we say that a diseased cortex will continually vitiate and revitiate the mind, then we run counter to the statement that the mind is superior to the body.

Where is the actual seat of the disease? It is not in the body, as shown; it is not in the mind, for that is the sufferer and is overpowered by the influence, so that a mere ap-

peal to the patient's intelligence is not sufficient. Clearly another thing, or several other things, besides the body, mind and soul are needed for the explanation. Then again, whence do the changing atoms of the body come and what is it that causes them to keep on building themselves up in the same vitiated form? The answer to both these questions is to be found in the Theosophical teachings about the other "principles" that go to make up man's lower nature. The disease inheres in a part of the man which is beyond the physical, but yet lower than his mind; in this it lies stored up like the life in a seed, ever sprouting up afresh from its root, as fast as the branches are lopped off, and continuing to reproduce itself in the cortex as long as the stored up energy of the germ remains.

The Doctor makes a plea for the more scientific treatment of morally diseased persons, and for regarding them as patients rather than as criminals. But we must work at both ends; moral treatment is necessary, and perhaps we have erred in the past, not in giving moral treatment, but in not giving the right kind. The soul being superior to the mind, and the mind to the body, it stands to reason that these higher principles must be brought into activity if the whole system is to be cured. We may help the patient by physiological treatment, but we must work and work away at him morally and mentally until that seed of deformity in his astral or psychic nature is all exhausted, and not be discouraged if he shows no response for some time. We can arouse the reformatory power, and it will work, even if silently at first.

Alcoholism and dissipation in our ancestors leave a scar on their progeny. Alcohol has been proved by experiment to exert a most deteriorating influence on progeny, and I have known a pyramidal layer so destroyed by alcohol as to be less than half its proper depth. Alcohol puts out of action the prefrontal arc of the brain, which is the last and highest piece of architecture. It is the seat of control. Destroy that and you have as the result a person who cannot help being a criminal. There is in fact no such thing as freewill except in the perfectly normal brain.

Of course, as said before, the disease caused by this alcoholism lies deeper than the brain, for the brain is continually reproduced in the same diseased mold. And the fact that a person with a diseased cortex (pyramidal layer) has no responsibility does not mean that his pyramidal layer *causes* responsibility; it merely means that a person with no responsibility will have a diseased pyramidal layer. The physical deformity is the outcome of the inner deformity. If it were only the brain that were diseased, the cure would be short and easy; the trouble is the self-reproducing stored up fund of disease. Hence such criminals can only be kept under care and treated with great patience. The great need of course is to abolish the conditions of life by which such persons are produced, but above all to awaken the slumbering Soul. STUDENT

# Art Music Literature and the Drama

## Wanted—a New Literature

BEFORE the mind's eye of one who is serving and serving because there is no other thing on earth worth doing, there come times when the needs of humanity—the yet unvoiced, perhaps even unfelt needs—rise like a company of souls and pass by as in line for review. And the feeling is that of the sower who stands beside some vast, fertile, yet unsown field and sees in imagination what will be the golden glory of harvest-time if the seed be scattered broadcast *then and there*. One wholly ignorant of nature's laws might not have this feeling nor would he rise of himself, spurred on by the urge to plant, to plant, to plant, for those whom he does not know, perhaps, and may never see. But that argues not that needs which only some future harvest-time can answer are dim imaginings. It merely argues the existence of one more clod in a world of souls.

The student of Theosophy in looking over the field of literature—more particularly poesy—finds himself in the grasp of just such feelings as beset and urge the true sower who stands, in seed-planting time, on the edge of his unsown fields. Still more keenly, more prophetically, will he feel this when the din of present-day criticism reaches his ears, with its so many theories, so many arguments, so many differences of opinion. There would seem to be, in fact, one point of agreement only—this, that our presses print too many books and our writers write too much. The appeal (and with some show of justice) is for fewer books and more wisely-chosen ones, our critics declaring that our young folk particularly are in danger of getting lost if not, so to speak, drowned, in the literary ocean at present threatening us all with inundation.

Strangely, for the Theosophist believes in simplicity in all things, this is exactly the point upon which we take issue. There is not too much writing, there never has been and never will be—*of the right kind*. There certainly is, of the wrong kind, the irresponsible, the negative, the useless and the dispensable. But the quality that condemns these is a most subtle one, so subtle that only the few see how tainted with it are many of the greatest writings of our poets, those so great that in spite of the taint we keep and read and love their works and shall do so. It is the taint of a wrong philosophy of life, a philosophy that sits and weeps on the edges of graves that it so wishes it hadn't made! that finds life insupportable but a necessity, existence a problem hopeless of solution, yet withal an artistic

old ruin that warms the cockles of any artist's heart, of course—and so the play keeps on. If this seems like over-statement of fact, look into any anthology and then do a simple sum in algebra. What proportion of the poems voice a wholesome, optimistic, just, sane, selfless and courageous philosophy of life? What proportion of them lift love above the plane of Rosalys' eyebrows or Phyllis' selfish little smile? How many enunciate compassion without a sanctimonious lisp that makes us hate it? How many touch the great problems of the day with any true understanding, with real, divine fervor, with that love that would lay down its life for a friend? Some, yes—but how few are they! Even the lyrics of Tenny-

by sentimental children of fifteen! How much more would the joy-note do to shape wisely a budding life—for our young folk *will* have poetry as they *will* have music, of some kind, and drama and art. Why not give them the optimistic *as well as the pure*? To mention but one more—and the admittedly great works of our masters of poesy are purposely chosen, for these have set the measure for the multitude—Rossetti's *Blessed Damozel*, one of the most poetic poems, if one may use the expression, that ever pen put upon paper:

The Blessed Damozel leaned out  
From the gold bar of Heaven;  
Her eyes were deeper than the depth  
Of waters stilled at even;

She had three lilies in her  
hand,  
And the stars in her hair  
were seven.

But at the end the lover for whom the Blessed Damozel waits doesn't come to heaven, and she falls weeping and passes, drowned in despair! How much were it greater had Rossetti touched, even ever so lightly, upon the ideal of woman's power to rise above personal love to the heights of divine compassion, of service to all? No, there are not too many writers; but there are too many dipping their pens into mouldy ink, there are too many still hugging despairs and sickening personal memories and that lusty, wriggling

mental brood that hates the sun. And all this, with the whole earth turning sunward, with educators and parents everywhere searching with microscopes after something optimistic and joy-bringing in poesy for the children they guide! What has become of the Light that inspired the *Odyssey*, with its final joy, reconciliation, victory, reunion, its mystical "Covenant of Peace"? It is the theme eternal, but where are our poets today that they perceive it, touch it, understand it, if at all, only in some fragment here or there? Has philosophy gone astray—or are minds more errant than once?

The decades pass swiftly. Before we know it the need, now recognized by the few, will be felt, bitterly, urgently felt, by the many. And it will be met. There is today, as half the world knows, an immense prose literature along lines of Theosophy. But, as very few so far know, there is in the building an equally immense literature on lines of the highest poetic and dramatic expression.

Those who love humanity are building and storing against the day when men in despair and soul-want will turn to them and call. And when the world demands a new literature, behold, it will be at hand. LOMALAND STUDENT

Lomaland Photo. and Engraving Dept.

RIVER SCENE, GÖTEBORG, SWEDEN

son, that master of musical verse, are filled, many of them, with a sadness that leaves its impress on the reader for hours, and without any lift out of it. Take that one which critics hold almost loveliest of all, musically:

Tears, idle tears, I know not what they mean,  
Tears from the depths of some divine despair  
Rise in the heart, and gather to the eyes,  
In looking on the happy autumn-fields,  
And thinking of the days that are no more!

Dear as remembered kisses after death,  
And sweet as those by hopeless fancy feigned  
On lips that are for others; deep as love,  
Deep as first love, and wild with all regret;  
O Death in Life, the days that are no more.

A very unpoetic person might remark, "H'm, rather illy spent days they must have been!" What a lesson! We may justify it, as we forgive and understand the dissonance of a passing-tone in music, as placed in *The Princess*, in which, it must be admitted, the poet strikes a rarely wholesome balance anent the "woman question." But where encountered there once by a reader it is probably met scores of times as an isolated bit in our "Collections" and "Anthologies," and the writer has heard it recited at church socials

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## Theology vs. Science

A SOUTHERN paper reports a sermon in which the speaker vindicates the Bible against science by showing the shortcomings of science. His case would be strong, for science has many shortcomings, were it not for the fact which he appears to have ignored, that the Bible also has many shortcomings—or rather, one should say, the Bible as expounded by ecclesiastics. Almost all his points against science cut both ways.

For instance, he says that scientists are not agreed, leaving us to infer that theologians are agreed. Next he says that the Bible states that "In the beginning God created the heavens and the earth." He makes no allusion to the fact that the word here translated "God" is the Hebrew *elohim* meaning "gods," and not the word *Jahveh* or *Jehovah*, which occurs elsewhere and is also translated "God." Other systems of cosmogony, from which the ancient Hebrew writings have been derived, show us that the word "gods" refers to the formative powers that caused the evolution of the worlds out of primordial chaos.

Next we have a story that Lyell, the geologist, unearthed from the Nile Delta a piece of pottery that must have been thirty thousand years old; and that it was afterwards discovered to be a piece of modern Roman pottery. This is followed by the statement that scientists have given up the idea that Niagara must be 35,000 years old, and have concluded that the past rate of cutting back must have been faster than the present, so that Niagara is only seven or eight thousand years old. (Even so, it must have begun one or two thousand years before man's history began, according to this preacher's chronology!) He gives one or two other instances of mistakes or alleged mistakes in computation of time; but what about the simply countless instances he does not give? Has the whole scientific and historical world really come to the conclusion that man did not exist before 4004 B. C.? The preacher says: "The Bible does teach that man's history on the earth began about 6000 years ago. We get this from Biblical chronology." Biblical chronology, formed by adding up the ages of the patriarchs and taking the Creation and Deluge stories in their literal dead-letter sense!

Next the scientific views on evolution are

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

attacked, it being stated that many of the most prominent of these are unsupported by facts, and that scientists are now giving them up. It is added that there is a tendency for the pendulum to swing the other way and for scientists to tell us we are degenerating and shall *become* animals; and indeed some writers have lately been developing the theory of degeneration. But do these presumptive failures of science vindicate orthodoxy? Has it anything better to tell us about the origin of man? If so, let it tell us.

The best this preacher can do is to give the idea that the intellect of man is so feeble that he must fall back on the old theological interpretations of the English translation of an ancient Hebrew Genesis myth, and on the group of dogmas and traditions that have accumulated during the Middle Ages. But Theosophy can show people how to understand their Bible without either turning it into an incredible story or rejecting it altogether. If regarded as simply one of the numerous presentments of the universal Wisdom-Religion, and studied along with other presentments of the same, we can arrive at the essential truths with regard to the Genesis of worlds, the origin of man, and evolution. Meanwhile, however, it is instructive to observe that with religion and science mutually undoing themselves, the ground is left clear for the Theosophical teachings. After all, the theology of the day is too poor an affair to weigh in the balance against our science. For even if the latter connote no more than our brain-percepts and concepts of matter, it is at least—or it aims to be—both spatially and chronologically on a cosmic scale of breadth. While the former—connoting mainly medieval brain-adumbrations as to the creative mind underlying life's phenomena—is constructed upon a scale so paltry as to merit little more than the respectful attention due to our fleeting hallucinations. The tribal gods of some so-called savage races have more dignity about them than

a god who created this particular little planet out of nothing a few centuries ago, found he had blundered badly, and then sent his son to be killed to appease his own wrath against his creatures for doing what they could not help; and after this pre-arranged murder, allowed the remaining creatures to plead that event in extenuation of their

own short-comings. Many vast libraries have been filled with the writings of well-meaning but unphilosophical religious sentimentalists in the effort to erect this crude medieval theme into a philosophy called theology, but without success. The human heart cries out for knowledge—and has been heard. STUDENT

## The Theosophical Interpretation of the Bible

(CONCLUDED FROM PAGE 12 OF LAST ISSUE)

CHRIST'S esoteric teachings have been lost and all we have is a lot of dogmas built on the exoteric. All teachers had esoteric schools. Many of the other teachers have left records of their teachings, couched in symbolical language. What has become of the esoteric teachings of Jesus? We shall find if we read the historians that many books were hunted up and burned in the early centuries. Theosophy comes to revive the doctrine of the Christos.

"The Gnostics had many of the Essenean ideas, and the Essenes had their 'greater' and 'minor' mysteries at least two centuries before our era." (*Isis Unv.*, II, 42) In Ephesus flourished the greatest school of the Gnostics, wherein were taught the abstruse Oriental speculations and the Platonic philosophy. Had not the Christians burdened themselves with the revelations of a little nation, and accepted the Jehovah of Moses, the Gnostic ideas would never have been termed heresies; once relieved of their dogmatic exaggerations, the world would have had a religious system based on pure Platonic philosophy.

The Rev. Thos. Taylor says that the Eleusinian Mysteries had the sacrament of the Lord's Supper as the most august of the ancient pagan ceremonies, and that it was observed by the Athenians every fifth year in honor of Ceres (bread) and Bacchus (wine), who have given us their bodies to eat and their blood to drink.

Some day not far distant people will wake up to the tremendous imposition that has been practised upon the human race, since they went about destroying the ancient teachings, and got instead a mixture of Persian, Jewish and Egyptian. Then they talk about the wonderful beauty of Christianity; it is as if one took away your inheritance, returned you one per cent, and asked you to rejoice about it. OBSERVER

## From "THE SPHINX"

James Russell Lowell

THE meaning of all things in us—  
 Yea, in the lives we give our souls—doth lie;  
 Make, then, their meaning glorious  
 By such a life as need not fear to die!  
 There is no heart-beat in the day,  
 Which bears a record of the smallest deed,  
 But holds within its faith alway  
 That which in doubt we vainly strive to read.  
 —Selected

## Ideals of Prosperity

THE popular comic emblem of prosperity and happiness—that of a bloated individual wearing diamonds, smoking a large cigar, and exuding dollars—is a gross exaggeration, but an exaggeration of something that actually exists. It is a burlesque, but a burlesque of what?

In our ideals of happiness we should not perhaps wish to be quite so fat as the man in the cartoon; still we should like to be comfortably developed. We might not make a point of dining off actual gold, but we should certainly like to keep a good table. In a word, material prosperity plays the chief part in most people's ideas of happiness. Even many more refined natures, to whom the coarser pleasures do not appeal, still cherish an ideal none the less sensuous because quieter. Is humanity but grown up children whose idea of joy is more sugar than is good for them?

But fortunately for our real happiness, our destiny does not depend upon the vain hankering of our deluded mind. The real liver of the life is the Soul—that is, the real Self, the undeluded mind that lies back of the flitting images thrown up by our desires and imaginings; and it has other objects than the gratification of physical or mental pleasures.

In judging of the comparative prosperity and happiness of different people's lives, we use the false standard of our imperfect knowledge and shallow ideals. Viewed from the point of view of the Soul, fortune and misfortune are very differently judged. In history we read of great men going through a series of painful experiences and disappointments; and the narrative is often accompanied with moralizings on the vanity of human wishes. Yet, from the Soul's point of view, their life was fuller, richer, and more fraught with real happiness than the life of the shallower and more "prosperous" man who meets with recognition and favor.

These truths have always been recognized, but our religious and scientific theories of life do not give them the proper support. All the experience gained by the Soul during an eventful life would be wasted, if the life ended with the grave, or if the Soul never had further opportunity for realizing itself in similar spheres. The prospect of extinction or that of heaven destroys in man the incentive to

effort. If he realized that his Soul is immortal, and that he will have other opportunities of testing life as a human being on earth, he would deem it worth while to persevere in his efforts to master the mysteries of life. He would find a deep and unfailing happiness in the conquest of his destructive passions, in acquiring more and more self-control and experience, in expanding his mind in every direction; knowing that at death the work would be but laid aside for a time, to be resumed as we resume our daily avocations. Hence man would find his happiness in the realization of the best within him, in the gradual unfolding of the beauties of his own Soul. He would feel that any sphere in which he might find himself was the one best fitted to enable him to achieve the real purposes of his life, and he would seek to adapt himself inwardly to the circumstances of that sphere.

Such an ideal of happiness may seem visionary and unreal, because, do what we will, we cannot get away from the customary picture of life or imagine a condition of society in which things would be different. Hence the picture of the man who seeks happiness within himself may present itself as that of a dreary stoic engaged in making the best of a bad business. But there must be many simple people who do not know they have any philosophy of life at all, and yet who approach most nearly to the true ideal of contentment, finding a joy and peace coming from an unknown source within, and little troubled with desires, ambitions and anxieties.

It is difficult to realize how much false religious teaching and false philosophy have done to keep mankind back from advancing to truer ideals of life, and what mankind might achieve with truer philosophy to take the place of these false ideals. The orthodox theological views put a premium upon anxiety for personal welfare, and the Churches are generally allied with the cause of worldly interests. Science is wholly concerned with material life and throws no illuminating ray upon the mysteries of our inner life.

But, knowing that happiness depends principally on the health and balance of our inner nature, should we not study the laws of that inner nature that we may know how to gain and maintain that inner health which means peace?

Riches are but a poor symbol of true wealth. True wealth is the abundance of that inner vitality which can raise us above the afflictions that beset us from external sources; it is the realization of a bounteous life from within. Upon this we should set our ideals of happiness and prosperity, not upon the mere props and substitutes which offer themselves in lieu of it. But first it is essential that mankind should acquire a fuller realization of its spiritual life and become more aware of its own divinity. And this will come in proportion as we advance from the narrow creeds of theology and physical science towards the broad light of the Wisdom-Religion. E.

## Brotherhood

BROTHERHOOD grows deeper and broader in one's conception as one goes deeper into the study of Theosophy. Its meaning grows upon one, and the reality of its existence as "a fact in nature," as the Constitution

of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY states it to be. There is brotherhood *everywhere* in the Theosophic scheme of life—without and within. All proceed from the One Great Life and when the purpose of the coming forth is accomplished, unto It all will return with the garnered experience of the aeons of time. Proceeding from One there is kinship in origin, and speaking of humanity as one people with a like destiny of ultimate perfection, we are brothers journeying together to the same great goal. And the more we observe life, and *think*, the more we can see the actuality of the propositions of Theosophy.

But to really grasp the *reality* of Brotherhood demands *action*, as well as a mental acquiescence. It demands a line of conduct that will square with this foundation truth of life. It belongs to the Heart-Doctrine expressed in the "golden rule," which needs a more practical application to our daily lives than it usually receives.

We most of us feel hurt when a bad motive is imputed to our actions, but do we *never* err in that respect ourselves? Then why complain? If we plant the seeds of criticism, we must reap them, it is the harvest of the seed we ourselves sowed, and so on throughout the list. Are we really so foolish as to think we can get outside the laws of the universe if they don't happen to suit our personal views? No, the laws are fixed, but we can change our views and our attitude. Substitute "give" for "get," and you will take the first step in Brotherhood. The attitude of mind to all men should be one of friendliness. The name given in love to William Q. Judge, the Theosophical Teacher, by those who best knew his life of service to humanity was, "The friend of ail creatures," and the same might be said with equal truth of H. P. Blavatsky and Katherine Tingley. As said by one Divine Teacher, "Whosoever will be great among you let him be your minister; and whoso will be chief among you let him be your servant." And "He who is greatest among you is he who is wisest in his Brotherhood," said another.

Those who are brotherly in the real sense are not sentimental, but they are lovers of duty and give of their best for the common weal. They give themselves in service to the Great Ideal, in thought, in word, and in deed. Being practical people they begin at the right end—with themselves. They know that unbrotherliness with its attendant vices and delusions is abroad among men and they seek to minimize the evil by the active cultivation of the opposite qualities in themselves. They know the divinity of man is denied on all sides, but so much the more do they strive to manifest their divinity through action, thus developing the higher qualities of a Godlike nature. This is *true Brotherhood*, and gives the greatest aid possible to their struggling fellow creatures. And this is why Theosophical students love and honor their Teachers and the Teachers of the past, of all nations and races, who have upheld the Brotherhood ideal, "Not only with their lips but in their lives."

Theosophy teaches that these Great Brothers are the real redeemers of the race, advance guards, pointing the way to the Real Life, the true Home, whose gateway is the simple practice of Brotherhood. W.

## KARMA

IT maketh and unmaketh, mending all,  
What it hath wrought is better than had been;  
Slow grows the splendid pattern that it plans  
Its wistful hands between.

It knows not wrath nor pardon; utter true  
Its measures mete, its faultless balance weighs;  
Times are as nought, to-morrow it will judge,  
Or after many days.

Such is the Law which moves to righteousness,  
Which none at last can turn aside or stay;  
The heart of it is Love, the end of it  
Is Peace and Consummation sweet. Obey!  
— *Light of Asia*, Book the Eighth. (Sir Edwin Arnold)

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** In the maelstrom of conflicting theories regarding life and its purpose, and the relation between life and so-called death, what is the message that Theosophy has to give to the world? Can it give any certain light on the subject? What is real life? Will you kindly take up this question in the Forum?

**Answer** I. That which we call life and death is the changing play of the soul on and off the stage of manifested matter. At the right time the soul arrives, clothed in fleshly garments, progressively plays various parts of infancy, manhood, and age, and, leaving the discarded costume at the earthly theater, goes home to real life. For this drama of the soul Nature weaves out of tiny living cells a magical garment which has power to change and develop and strengthen to suit the needs of many parts until, worn by disease or old age, or accidentally or rashly put aside, the soul is again free.

W. Q. Judge said that the universe exists but for the soul; and this play of incarnation, experience and liberation is symbolic of the universal creation, preservation and destruction of all forms of matter which the consciousness uses as instruments whereby to perfect its knowledge here. From the parent cell, each cell unit of the physical body is born; from the life current of the blood stream it is preserved for functional use, and in due time its disintegrated elements find new combinations of matter. Likewise the body as a whole is created, is nourished, and preserved for functional activity and power; is disintegrated in Nature's storehouse at death, and its elements are again started on another round of this three-act drama. The history of nations, of which man is a unit, tells of the greater cycles of their gradual rise, continued growth and their decline. The modern excavations of archaeologists in the ten superimposed cities of Troy, disclose evidence of the natural gravitation of men of different times and types to cast the play of their individual and national lives on old dramatic centers of action. Science is lending color to the legends of sunken continents which Theosophy teaches were the stage-setting of the soul-drama in forgotten races of men.

The universal legends of *creation* point to the time before the great world stage itself was made manifest. That statement: "Before the mountains were brought forth, I am," suggests the soul calmly awaiting the rising of

the curtain on the painted picture of a universe which should be preserved until the mass of humanity should have learned to play all the parts and then the lights would go out to leave the useless stage in void and darkness. From the standpoint of the soul the incidents and changes of what we call life, or of many lives, are of trifling consequence in working out so great a destiny.

It is significant of the overwhelming physical sense that the soul is so little awakened in ordinary life here that fear of the change which we call death is almost universally felt. The consciousness in man is colored by the conditions in which it is acting. Naturally, then, he who is living in the physical senses — even though full of creature comforts — instinctively feels that this will end some time. Physical gratifications are dependent upon a physical instrument and cannot outlast it. Likewise, a selfish, even though, a brilliant intellect, may enjoy a somewhat higher type of indulgence. But without the sympathetic understanding of other natures, with the resulting impulses toward brotherhood ethics, even the cultured materialistic mind is marred with its own limitations and fails to feel that touch of the immortal which the larger hearted find by living in the lives of others. Each man is what he has made himself, and if he has cultivated no stock of unselfish helpfulness and love and large-hearted sympathy he has little ground for faith either in the largeness of the life here or in a better one hereafter.

The ordinary life would not be an evil or even the dreary commonplace it too often is, if it were so lived that the soul — the real actor — was more consciously alive. The selfish vanity, conceit, greed and sensuality so prevalent, are the other pole of the soul consciousness which feels its own greatness and beauty, power and wealth of being. If each man, whatever his attainments, were living up to his best possibilities, were actively using his powers of hand and mind and heart, he would create for himself an enlarging world of light and liberation, free from the pain of limitation and the restlessness of unused power.

The ancient division of men into four castes was a wise provision for the suitable activities of different grades of development. He of the servant class who was daily awakening to a world of greater knowledge of his own power and responsibility in handling his humble duties, would reap happiness in his growth, as would the cultured teacher who also served the higher law of development. We might view man's nature as composed of three castes — the physical, which may be a selfish sensual servant; the higher nature constantly seeking to raise the whole man; and the intermediate mind which fights for the supremacy of the body below or for the victory of the soul above it.

Since the very atoms are animated by a conscious life, and man's body is also ensouled, it is reasonable to think that the more conscious of the soul's life we become, the more alive we are and feel.

Let us first consider some physical obstructions to this larger sense of life. The gross physical sins are wrong because they crowd out the finer senses. Normal bodily appetites are not of themselves evil, but they should be the servants, not the masters. Physical power

is good and necessary to carry on activities on the physical plane; asceticism which produces weakness is an evil, as well as indulgence. We have a distinct duty to the body in keeping it strong, flexible, clean, and free — ready and able to seize the opportunities to make living more ideal and the joy of real life more real. It does not pay to indulge the passing pleasure of over-eating or wrong eating and then suffer from the heaviness or pain or fever which keep the bodily feelings uppermost and shuts out the finer senses. The social drinking which loosens the tongue and the emotions is not the way to sound those rare depths of friendship and sacred feeling which have no need of words. The boisterous, senseless gaiety which kills time and puts unpleasantness out of sight does not leave one with anything worth while to refresh with its memory. A normal, healthy child does not have thus to force his feelings at high pressure. He is a study in the satisfaction which comes from keeping busy with the real joy of living, of daily widening out his world.

The indulgence in alcoholics and in opiates gives a passing sense of ease and power by making the victim conscious of his latent vitality as it drifts outward. The tendency is to form the seductive habits at the expense of the will power which otherwise might be utilized by a high motive to discipline the body into right living and thereby win for the individual far more and lasting happiness.

We are everywhere surrounded by enormous forces of nature which only need suitable instruments through which to operate. The modern mechanisms of the electrician are showing the marvels of nature's forces which have always been in existence ready to respond to the guidance of intelligent will. The human body is a living dynamo which, if rightly used, can generate and expend unimagined power and endurance. The moral force of a strong will is neutralized in a body with equally strong appetites. The best way to overcome the strength of wrong desires is to cultivate a habit of living in the satisfaction of the higher sense. The old-time preaching of morality was keyed to the note of abnegation, of giving up what you had. There is need to emphasize the reality of the greater gain and the larger living and the finer sense of life and being which is ours for the taking, not in some future heaven but here and now. Endowed with the possibilities of the gods, it is pitiable to see how little of the best of man's nature is alive and awake.

It is often said that we are living too fast in this age of material and intellectual development. As a matter of fact we are not living up to the times. The machinery and the minds of men are capable of making ideal conditions in this sick, weary old world if humanity were spiritually alive to the expediency of doing so. The cultivation of the mental and physical senses and of the means of gratifying them is out of all proportion to the development of the moral nature. Such unsymmetrical growth must produce suffering. The abnormal conditions of body and mind are rapidly increasing along many lines. It becomes apparent that the only remedy which can harmonize and restore these disorders and distortions must be to infuse far more of the joy of soul-life into what we now miscall living. L. R.

### Chinese Ideographs

THE Chinese characters or ideographs used for writing in China, Japan, and Korea, are said to number about fifty thousand. Even scholars, however, rarely use more than about six thousand. The number of characters in common use in Japan is found to be a little less than three thousand. One who knows this number can read ordinary books, newspapers, etc. Each character stands for a root-word (the word "love" for example is a root-word, whence "lovely," "lovable," etc). These characters again are all formed from two hundred and fourteen radical symbols. These radicals were originally pictures or imitations of the shape of objects, some of which are still recognizable, but they have become conventional in form for the sake of ease in writing and simplicity of structure. Among these two hundred and fourteen radicals there are, for example:—*man*, *heart*, *body*, *air*, *fire*, *earth*, *metal*, *tree*, *animal*, *fish*, *sound*, *river*, *ghost*, *dragon*, *tortoise*, *hand*, *mouth*, *eye*, etc. Thus the simpler objects are easily represented. To form more complicated characters the simpler ones are combined in various ways,—usually they are placed side by side, but sometimes interwoven. Some of these combinations are simple and obvious, as for example:—*bird* and *mouth* equal sing, song, etc.; *hand* and *flea* make scratch; *sun* and *moon* make bright, brightness, etc.; *woman* and *child* stand for love; *woman* and *eyebrow* mean flattery (suggestive of Shakespeare's lines about the lover). Two trees stand for wood; three trees stand for forest. *Woman* and *good* make girl or daughter; *heart* and *good* make conscience (the good heart of man). *Man* and *mountain* stand for Mah-âtmâ (described in dictionaries here as immortal beings said to live in mountain fastnesses). *Water* over *fire* make steam. Two characters meaning "to declare" (like logos), make god. *God* and *path* or *medium* make nerves. *Ear* and *gate* make listen; *mouth* and *gate* make ask; *evening* and *mouth* make name, etc. All trees have the tree radical usually written at the left and another character beside it on the right to denote the kind of tree. The same with animals, fish, etc. Still another way of representing difficult words was later evolved. This latter is partly phonetic and more or less arbitrary, and the constituent parts do not always show the etymology as in the logical combinations given above. This was inevitable in the case of certain words. Take for example the conjunction *but*; how could this be represented? The difficulty was finally gotten over, however, and a way found. Thus words of all kinds, concrete or abstract, can be represented, and thought expressed with remarkable precision.

A common method of making phrases much used in China and Japan is by means of four characters. For example:—*east*, *wind*, *horse*, *ear*. We would translate this into English: It is like the east wind in a horse's ear (equivalent to our "like water off a duck's back"). The Sinico-Japanese method leaves out the "It is like the . . . in the . . ." and yet the meaning to one accustomed to the method, is quite clear. The Chinese writer leaves something to the imagination, and in making his brief suggestive picture he credits the reader with intelligence enough to see the applica-

tion of the different symbols it contains.

Other common four-character phrases are: *purple*, *mountain*, *pure*, *water*, (descriptive of scenery); *words*, *conduct*, *one*, *performance*, (agreement between words and conduct); *man*, *face*, *animal*, *heart* (human in appearance, but with the nature of an animal). *Ancient*, *modern*, *not*, *two* (without parallel in ancient or modern times). *Nine*, *cows*, *one*, *hair* (a small quantity, like one hair to nine cows). *Self*, *destroy*, *self*, *throw away* (reckless actions caused by despair). *Husband*, *shouts*, *wife*, *obeys* (in China!). *All*, *actions*, *not*, *constant* (the actions of man are temporary, or fleeting). *Peace*, *obliteration*, *obtain*. *happiness* (the peace which comes after death with the obliteration of earthly woes). *Cause*, *effect*, *meet*, *retribution* (Karma caused by actions in this or a past life).

These phrases are not merely composed of four characters, but as each character is spoken or read in these cases as one syllable, the whole phrase is composed of merely four syllables. The last phrase quoted about Karma, for example, is read:—*In*, *gwa*, *o*, *ho*. No language in the world could express such phrases so briefly. It takes, of course, a long time to learn even the three thousand characters used in ordinary books, but once they are learned a Japanese can read with great facility. In fact, from careful observation, I think they read at least as quickly if not more quickly than we do in English. The length of time taken in learning these characters, however, is the principal objection, and there is a society here in Japan which advocates the use of the English alphabet for writing Japanese words. This is quite practicable in the case of pure Japanese words, but in the words taken from Chinese so many have the same sound that without the written character it would be sometimes impossible to know the exact meaning. The word *Ko*, for example, has about ninety different meanings. To write in our alphabet the word *Ko* ninety times would mean nothing; written with ninety different characters, each meaning would of course be quite plain, although the sound were the same. In spite of this formidable difficulty, however, simplification being now desirable, we may be sure that the Japanese, and also the Chinese, will find a way. A STUDENT IN JAPAN

### Worshiping Childhood in the Abstract

THE following trenchant remarks occur in a review, in *Black and White*, London, of a book called, *English Children in the Olden Time*, by Elizabeth Godfrey.

We worship children nowadays—especially other people's children. Or perhaps not even other people's children so much as the children we read about in books. Children in books are delightful, airy, absurd little animals, our relations with whom are not spoiled by any sense of duty or responsibility. Towards other people's children we feel much the same. We look at them as we look at pictures or the sea. They are something that provides us with a new thrill. Personally, I doubt whether we discover a great deal of the secret of childhood by all this self-conscious and—shall I say?—aesthetic study of children. We shall never get to understand children by any intellectual method. Sympathy is the sole key to the child's heart and mind, and in these days our sympathies are overwhelmed in a flood of theories.

In fact we are apt to regard children almost

as if they were a race apart, instead of being men and women of the future, and to worship childhood in the abstract instead of having solicitude for the children themselves. A recent writer on children is of opinion that by thus worshiping the idea of childhood, and by providing so many children's books and amusements, we keep the children childish and prevent them from maturing so early as they used to do, and from taking an interest in more serious things.

The love of children is a most important thing and one of the great hopes for humanity; but the duties connected with it should be kept in mind as well as the pleasures. Those whose love impels them to wise effort have the truer love. Others may love them merely as playthings, leaving other people to do the work. A child is a human being, with a future before it, and is not destined always to be a child. It is wronging it to keep it childish and prevent the growth of maturer qualities. We should rather look at the Being within than on the childish form in which it happens to be vested during the period of growth. It takes wisdom to steer between the extremes of indulgence and severity, and to avoid hasty theories.

### Correspondence

[The following communication from an esteemed correspondent speaks for itself. The paragraph in the issue of this Review for Aug. 4, mentioned below, was based, it appears, on a report which had gone the rounds of the press.—Editorial Note]

Sydney, 29th Oct. 1907

EDITOR CENTURY PATH.

Dear Editor: In your issue of the 4th August this year, under the heading of *Terrible Privations in the Australian Desert*, it is stated that "the interior of Australia is a most terrible torrid desert." Enclosed is a paragraph on this subject from our press. Some of the early explorers reported that the center of Australia was a *great lake*. This was because they visited the country in a wet season. We are subject to occasional *wet* as well as dry conditions in the interior of Australia.

There are *parts* of the interior near the west side of genuine desert but only in small proportions to the whole which is very rich country and only requires the solution of the water problem to be phenomenally productive.

Unknown Australia.—The ignorance which prevails regarding Australia on the part of the world generally, and regarding the extreme back blocks, on the part of Australians themselves, was referred to by Mr. James Rickard in a lecture delivered before the Sydney Chamber of Commerce on Monday. For, instance, people generally believed that the center of Australia was hopeless desert. Future generations would show the stupidity of this belief. Professor Gregory said: "Round Lake Eyre an abomination of desolation covers thousands of square miles of country which has a soil of exceptional richness, an invigorating, bracing atmosphere, and a climate free from malaria and the special diseases of most sub-tropical lands. Given but water, that country would be as fertile as a garden, and if kept free from mosquitos and malaria as it was last summer, it would be an Eden." (The Sydney Morning Herald, October 23, 1907)

# THE MYSTERIES OF THE HEART DOCTRINE

Prepared by  
**KATHERINE TINGLEY**  
AND HER PUPILS

## *The Theosophical book of the Twentieth century*

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1.25 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

Order now from

### Past and Future

AT the end of every year the able editors look back along the track of this atom, this corpuscle of time, and tell us by how much civilization has progressed. A criterion of civilization, for a sufficiently good reason, they do not give us. But they nevertheless agree that year by year we are becoming more civilized. The average reader reads and feels comfortable — unless he happens to be one of those who do not know whence the next meal is coming. Is not trade increasing nearly as fast as the number of battleships? Think of the quantity of pig-iron we produce, and then compare us with the ancient Egyptians and Babylonians and Hindûs and the other queer old people!

Suppose we put aside the pig-iron business and wireless telegraphy, and take another start. There have been a good many attempts to do this lately, as if the general conscience was getting a little uneasy. A lady writer, apparently with considerable historical knowledge, thinks that intensity of spiritual aspiration would be a good test of civilization.

### What is Actual Civilization?

Applying it to our own, she finds us to be degenerates. Among many ancient people it has been much higher than now.

Another test, never yet properly worked out — perhaps it cannot be — would be strength of moral will. We cannot say whether in the past there was ever a civilization of the youth of our own, which exhibited less power of self-control, less power of controlling those sensual impulses whose effects are at the same time fully known and feebly fenced with drugs, less power of carrying approved courses of conduct into execution. Imagining for the sake of contrast the *ideal* type of man and woman, one can see in the faces and carriage of nine out of ten people one meets, the inherited and acquired evidences of surrender to the forces which wreck body and mind.

Sir William Ramsay has recently attracted considerable attention to his opinion that we are degenerating. That is the picture given us by such history as it is possible for us to study. The picture is necessarily incomplete:

### We do Not Yet Know the Ancients

Ancient civilization perished almost utterly; comparatively few specimens of its literature survived; far the larger part of its institutions and methods in the organization of society disappeared utterly from practical life, and can barely be guessed at now, as some saner ideas of the ancient world are being recovered. When one looks at the terrible suffering that accompanied the conquests of the worst tribes of destroying barbarians, from the Huns to the Mongols,

when one remembers the wanton and reckless destruction of almost everything that the ancient civilization had constructed, the utter loss of so much that was useful and beautiful, so much in social life that has to be slowly recovered and has as yet been by no means all recovered, in order to make life good and healthy and sound, it seems as if history were the game of a wanton child playing with its toys and wasting or throwing them away as it tired of them. What can explain and what can repair the week-long sack of the greatest city of the Middle Ages by the Mongols, the annihilation by ignorant savages of the biggest collection of the remains of the ancient world, and all that this total wreck means to the civilized world? Is there reason in this, or mere blind chance and foolish caprice?

His conclusion is very definitely stated:

### Degenerate Remnants Only

I was forced by the evidence to the view that degeneration is the outstanding fact in religious history, and that the modern theory often takes the last products of degeneracy as the facts of primitive religion. . . . The practically universal view in the ancient world was that decay and degeneration were the law of the world; that the Golden Age lay in the beginning, and every subsequent period was a step further down from the primitive period of goodness, happiness, and sympathy with the divine nature. . . . A feeling like this cannot safely be set aside as false. It must be explained; and the only explanation is that it arose from the universal perception of the fact that the history of the Mediterranean world was a story of degeneration and decay.

We may note that our civilization is a continuation of those of the Mediterranean world.

The ordinary picture of evolution taught in the schools Sir William Ramsay curtly sets aside:

The primitive savage who develops naturally out of the stage of Totemism into the wisdom of Sophocles and Socrates, or who transforms his fetich in the course of many generations through the Elohist stage into the Jehovah of the Hebrews, is unknown to me. I find nothing even remotely resembling him in the savages of modern times.

### Progressing Savages Unknown to our Experience

It will be observed that Sir William Ramsay, like the writer to whom we have first referred, appears to make religious feeling, and not pig-iron and wireless telegraphy, the test of civilization.

Mr. Bryce, speaking recently on the same subject, takes moral courage, the virtues, love of truth, and the creative powers of genius as his tests. As to the last, he may not be quite sure whether it has decayed, but he is quite sure that it has not grown. Of happiness he thinks there is less, adducing the increase of lunacy, divorce, and suicide as his evidence. As to the virtues:

Who will even assert that the love of truth and the courage to deliver the truth, a virtue which lies at the root of many other virtues, has grown stronger or more common?

In the January issue of a well-known Review, Dr. A. R. Wallace, writing on "Evolution and Character," expresses his conclusions in the following words, which command the attention and respect due to his mental eminence and scientific reputation:

We are forced to the conclusion that we are today, in all probability, mentally and morally inferior to our semi-barbaric ancestors.

There seems to be little doubt that the degradation theory showing man declining from a primeval state of innocence and wisdom—so popular in the early quarter of the last century and so bitterly opposed by the materialistic philosophers of the time—is regaining favor in its own enemies' camp. So be it; it is a step forward; but until the Theosophical doctrine (as old as man himself) of the *cyclic rise and fall* of civilization be accepted and worked upon, hypothesis, speculation, and wrangling will reign supreme in the scientific mind.

On the other side of the case we have Professor Giddings of Columbia University. His plea is the best that can be made, and for that reason interesting.

It has to rely mainly upon what may be called the pig-iron and wireless telegraphy arguments, and upon its readers' ignorance of history. To that ignorance even the very title of his paper is an appeal—"The Greatest Reformatory Period in the History of the World"—as also a remark in the body of it: "The people that created Civilization have also been creating Progress."

"Created Civilization"! Shadows of uncounted bygone Empires!

Well, he is writing in a popular monthly, and the people can but know what they have been taught. They can hardly know that even our supposed superiority in the mechanical arts and sciences is only a supposition which there is much to discredit and which Theosophy can show to be baseless. Destructive human cataclysms like those to which Professor Ramsay refers had occurred time and again before the remotest period upon which the faint search-

light of history sends its farthest beam, and according to Theosophy will occur and recur again and again in cyclic rise and fall. That little

which incursive barbarians left, ages of time sufficed to skeletonize or bury or utterly destroy. The traces that remain for the spades and measuring-tapes of archaeologists might suggest to us not only a knowledge of sciences equal to our own but a knowledge of some of which we know nothing.

No: a sane and stable optimism cannot be developed by denying history, or ignoring it; nor by gross and flatulent adulation of ourselves and the present. In nearly every direction the outlook is bad and ominous. The one light of promise is the power which we have, by Theosophic training to awaken in the young children those ideals and divine powers of self-mastery which have slept for ages. For *we and they*, in epochs of which

the memory sleeps in our souls, created and sustained and let dissolve into ruins the civilizations whereof history knows something and those yet greater ones where-

**The only Substratum a Moral One** Little by little we let go, and have not yet begun to regain, the moral virility that created

and sustained them; from time to time with an ever enfeebling grip we seized it again. And now, as witnesses to the enfeeblement, in this which truly looks as if it might be the last effort, we have our suicides, our divorces, our degenerates, our lunatics, our starvelings, our little span of thirty-odd years, our scrofula—and even our wigs and porcelain teeth!

But they are not the real heritage of the great ages. We can get *that*—if we will.

STUDENT

### Atoms, Electrons, Ether

WRITING on the new theories of matter, M. B. Latour says in the *Paris Cosmos* (as translated by a contemporary):

Not long since, matter—the chemical atom—appeared as a somewhat complicated structure, of variable form according to the chemical elements under consideration. . . . Side by side with matter, all physicists agreed in recognizing the existence of a medium having special properties—the ether—in which ordinary matter is plunged. This etheric medium is indispensable to explain the propagation of the vibratory movements that constitute light, radiant heat, and electric waves. Matter and ether were supposed to be indissolubly linked together, and mutually impenetrable; but, while they entered in common into divers physical phenomena, their natures remained completely distinct, and they seemed irreducible the one to the other.

Today the position of science is changed—another step has been made toward unity. Matter and ether are no longer two distinct constituents of things, and . . . matter seems to have given place to ether. Matter, which for the purposes of our common and gross experimentation appears to be in some sort the sole fundamental physical reality, is now only a modification of the ether. Regarding the nature of the ether, on the other hand, there continues to be deep mystery, and even its more important and primordial properties are the subject of discussion among scientific men, some attributing to it extreme tenuity, others regarding it as the densest of all known substances.

To explain a certain effect produced by magnets on the spectra of gases, a physicist supposed the existence of "electrons"—electric particles smaller than atoms and entering closely into their constitution, and the vibrations of which he regarded as generating light and radiant heat. Both experience and theory, we are told, lead to the conclusion that these electrons carry a charge of negative electricity; and their mass has been calculated as about one-thousandth that of a hydrogen atom. The electron is considered to be a "local modification or deformation of the ether," [which theory of course requires the ether to be elastic and therefore atomic]. When the electrons are in motion, we have an electric current. Certain of the electrons are free and can move from atom to atom, as is supposed to happen in the interior of a conductor carrying a current. In electrolysis, the atoms which have an excess of electrons in them (and are therefore electro-negative) are carried to the positive electrode, and those with a deficiency of electrons (which are therefore

electro-positive) to the negative electrode. It is the vibration of electrons that sets up electro-magnetic waves in the surrounding ether, including those of light and radiant heat; and to the electrons are also due the X-rays.

These electrons, what are they? They are smaller than the atoms, and constitute the atoms. Thus the atoms are themselves atomic. And are the electrons also atomic? If so, where is the scale to end? and if not, of what are they? If they are vortices in the ether, what is the ether? A "perfect fluid"? Mysterious conception! answering to which we have no experience.

If all the properties of matter are functions of its structure, and all the physical forces are movements of some rudimentary substance; this underlying rudiment must *ex-hypothesi* be devoid of those special properties and forces. It is a property-less substance, and by its movements are caused matter and force as we know them. It is the substratum of all physical matter and force. Perhaps the ether is made of it; perhaps there are many intervening stages between it and the ether.

And when we have gotten this rudimentary substance, do we then need something to set it in motion? Or shall we postulate motion as an "inherent attribute" of the substance?

This substratum of physical manifestation cannot be conceived in terms of matter and space; for *ex hypothesi*, it has none of their properties. The attempt to analyse things into finer and finer kinds of matter, and smaller and smaller atoms, will be infinite; we can go on ideally dividing for ever. When we reach the limits of our senses, we have gone as far as actual perception will take us in that direction.

Older scientists have recognized four elements in nature—earth, air, water, and fire. Our scientists recognize the solid, liquid, and gaseous states, corresponding to the first three of those elements; but when it comes to fire, they make an abstraction of it. Fire is a mass of gases, etc. in an incandescent state, they say. Yet there are many phenomena in connexion with late discoveries that tend to the idea that fire (or light) is as much an actual state of matter as the other three. This brings up the old question, *An lumen sit corpus nec non?* "Is light a body or not?" And, as we do not know what a body is, or what matter is, or what on the other hand motion and force are *per se*, the question becomes meaningless. What we do know is that the underlying spirit and substance of nature interact and manifest themselves to our senses as solids, liquids, gases, light, electricity, etc. But there seems no valid reason for calling some of these matter and others force.

The forces of physical science are abstractions—merely a name for the observed effects of an unknown agent. To quote H. P. Blavatsky, "as well call the noise of chariot wheels a force; the force that drives the chariot is not the noise of the wheels; it is the driver, and the noise is only an effect." So the physical forces of sound, light, heat, etc., are only effects. The active cause of them is as inscrutable to physical observation, or to the imagination merely founded thereon, as is the fundamental *substance* above spoken of. Yet this duality of spirit and substance underlies all physical manifestation. STUDENT

# Some Views on XXth Century Problems

## A Bishop on the Horns

ONE of the best known of the English bishops, Dr. Charles Gore, thinks it very dishonorable of the clergy to be preaching what they do not fully believe. So far as the clergy of his own diocese are concerned, he will do his utmost to prevent the scandal. In a recent volume of sermons and lectures he says:

I have taken occasion before now to make it evident that as far as I can secure it, I will admit no one into this diocese, or into holy orders, to minister for the congregation, who does not *ex animo* believe the creeds. I am supported in this resolution, I feel sure, by the general mind of the Church.

In the same volume he notes a tendency of "the best moral conscience of mankind" to be alienated from "Christian teaching." The specially alienating item is the idea of vicarious atonement! Here are the bishop's words:

The peril under Protestantism has been for people to dwell complacently upon "the danger of thinking to be saved by works," and to take Christ's "finished work" as a substitute for their own effort. And the idea of vicarious punishment—Christ punished that we might be "let off"—has, more than anything else, tended to alienate the best moral conscience of mankind from Christian teaching.

But this idea of vicarious atonement is not only in the creeds but in the Articles and more or less throughout the prayers of the whole ritual of the Church. We can only suppose that the bishop does not himself accept the teaching to which he requires *ex animo* adherence from his clergy!

He also stands otherwise self-labeled a heretic in the same utterance. For he postulates a "moral conscience" as at work in that part of mankind which is outside the Christian fold: indeed so working as to *keep* it out! Does he not know that his own Church denies the possibility of any such conscience? Article XIII of its Constitution says:

Works done before the grace of Christ, and the Inspiration of his Spirit, are not pleasant to God, forasmuch as they spring not of faith in Jesus Christ, neither do they make men meet to receive grace: . . . yea, rather, . . . we doubt not but that they have the nature of sin.

According to this atrocious pronouncement, the cup of cold water given for mere humanity's sake, and "before the grace of Christ," is of the nature of a "sin"! A "heathen" may (according to the bishop) have moral conscience enough to reject the tortuous nightmares of Athanasius, but not (according to the Article) enough to constitute his inspiration in anything noble and beautiful he may do! Indeed the more he yields to his impulses of compassion and compassionately serves his fellows, the more sins he commits.

The Bishop is mistaken; the idea of vicarious atonement may be unpleasant enough to the moral conscience of mankind, but there are some much more unpleasant things in the formal creed.

We must leave him to straighten out his own paradox. He *must* do so or Athanasius will see to it that he goes into "everlasting

fire" (vide the Athanasian creed). "Whoever will be saved, before all things it is necessary that he hold the Catholic Faith." And the Catholic Faith, according to Dr. Gore, is in the creeds and Articles which teach vicarious atonement and everlasting fire, and which Dr. Gore will enjoin throughout on his clergy.

Truly Theosophy has no higher work than the rescue of Christianity from the "Catholic Faith" and of Christ from his unconscious foes. His doctrine once cleared will be the medicine of the age. STUDENT

## Christian Hypnotism

FOR some little time a small cloud has been looming in the clear sky of "Christian Science" and people were perhaps wondering when it would be anathematized and properly dissipated. A new and rival movement invites the mentally and physically sick to the church parlor and hypnotizes them in various degrees; though hypnotism is not the official description of the methods.

The exorcizing pronouncement has now appeared. The new method, it appears, errs and departs from Christianity in recognizing the *existence* of the disease it proposes to *cure*. "As revealed in Christian Science, God is unconscious of matter, for if he is Spirit, and All, he cannot know aught that would be the very unlikeness of himself in quantity, quality and divinity."

Having thus learned that God is All, and therefore man, and that therefore man is God, we pass on.

"Neglect of this, the real meaning of Christianity, resulted in a loss of the power to heal the sick centuries ago. . . ." (!)

But who lost the power? If God is All, it is he who must have lost his own power. And who is sick? Alas, the universe contains (or is) a sick God who cannot heal himself! One of his diseases is named—leprosy:

"In other words, they who drop Spirit as the one and all of Christianity, thereby lose the demonstration of the power of Spirit, through Christ, to heal the sick and cleanse the leper, to destroy sin, disease and death."

The root of the logical difficulty is obvious. Once you endow the infinite abstract principle of being with any attributes that are or ever will be conceived in human mental consciousness, you are on the horns of a dilemma. Call it God and the mind has already endowed it with numberless attributes now inseparable from that word. Call it mind and you have made it something that operates in time, and to an end not yet present. Call it love and you have separated it from that which is loved. Theosophy teaches that there are *Gods* who guard and guide the universes and the lives thereon, and these have in various degrees the attributes we reverence, and do work intelligently and beneficently for an end. Every man's consciousness is illumined by the essential light of one of these, the light that constitutes his divinity and is the source of his power over his own evil. That is *his* God, the Father in Secret. To deny the evil is to

hypnotize and stultify his mind and to paralyze his power.

Mind must move freely, facing and dealing with facts. Once that something which it sees to be untrue is forced upon it, once that it has been compelled to shape itself into a formula visibly untrue, it is thenceforth unfitted to deal sanely with any facts. STUDENT

## The Hidden Elements

M R. Martin Harvey, recently defending the actor's art, likened the actor, in effect, to a general who calls up whatever troops he needs for the defense or attack of any particular position. The troops are the "unconscious latent personalities" of which we all contain so many.

"Man is composed of many 'egos,' and when the actor acts any particular part, one of these 'egos' will live before us." The power to call on any one of these at will constitutes the genius of the actor.

But to call these things *egos* is to leave no name for that which has the power to evoke and combine them. They are elements, rudiments, seeds, from many sources, lying latent in the deep soil of consciousness. Diverse blendings of them constitute most of the cases of "multiple personality."

Some are the remains of the actor's own past personalities of other lives. Some come to him from the "spiritual plasm" of heredity. Some are planted in him by his associates. Some, by the creative power of imagination, he plants in himself as ideals. Some he creates imitatively, by the same power, from his study of or sympathy with or admiration for others.

The actor's art does then consist in the selection from among these, in the fitting of them together to make up the personality in which he is to move.

His assumption of a rôle has been compared to incarnation. But the incarnator *wrote the part himself* in former lives, and also wrote some others which he cannot play with that particular company and setting. He may play nothing in his whole life but a previously written rôle. Or he may transmute the characteristics of his mask as he goes along into something liker to his inner spiritual nature. Or he may let some characteristic run away with him and, for the time, absorb him. He may remember, or not, his real (and therefore spiritual) self. Echoes from former rôles, perhaps very evil, not played out to their finish, may come back to him and inspire strange and perhaps horrible breaks in the continuity of the present part. Every man must some time play in fitting company and setting every rôle sealed away within him until he has transmuted himself in each into his real spiritual self. In some settings the task is hard, in others easier. Once that is done in any of them, it is *very* easy in any other, and very rapid. But every seed, element, rudiment, *must* be dealt with in some way to that end, either killed, or transmuted, or nourished as a fit portion of a perfect whole, the perfect man. STUDENT

## The Todas

THE European residents of India know comparatively little about many of the mysteries of that country; for, although they may have explored most of it, their attitude of mind usually prevents them from learning things that are not on the surface. H. P. Blavatsky, writing in *Isis Unveiled* in 1877, says that hardly fifty years before in penetrating the jungles of the Blue or Neilgherry Hills in Southern Hindustan, a strange race, perfectly distinct in appearance and language from any other Hindû people, was discovered. Some cranks connected them with the "Lost Ten Tribes," alleging a Jewish appearance, which is by no means true of them. They were strikingly handsome, having been compared to the statue of the Grecian Zeus. After fifty years no more has been learned about them than at first. There is a foolish rumor about their practising polyandry, and this alleged practice is held responsible for their alleged diminishing numbers; but, states H. P. Blavatsky:

We had the best means of learning much about them, and therefore state most positively that the Todas neither practise polyandry nor are they as few in number as supposed. We are ready to show that no one has ever seen children belonging to them. Those that may have been seen in their company have belonged to the Badagas, a Hindû tribe totally distinct in race, color, and language, and which includes the most direct "worshippers" of this extraordinary people. We say *worshippers*, for the Badagas clothe, feed, serve, and positively look upon every Toda as a divinity. They are giants in stature, white as Europeans, with tremendously long and generally brown wavy hair and beard, which no razor ever touched from birth. Handsome as a statue of Pheidias or Praxiteles, the Toda sits the whole day inactive, as some travelers who have had a glance at them affirm.

After quoting some of the statements made about them she continues:

We will try to correct a few of these opinions, as far as we have learned from a very holy personage, a Brâhmanam-guru, who has our great respect. Nobody has ever seen more than five or six of them at one time; they will not talk with foreigners, nor was any traveler ever inside their peculiar long and flat huts, which apparently are without either window or chimney and have but one door; nobody ever saw the funeral of a Toda, nor very old men among them; nor are they taken sick with cholera, while thousands die around them during such periodical epidemics; finally, though the country all around swarms with tigers and other wild beasts, neither tiger, serpent, nor any other animal so ferocious in those parts, was ever known to touch either a Toda or one of their cattle, though, as said above, they never use even a stick.

Furthermore the Todas do not marry at all. They seem few in number, for no one has or ever will have a chance of numbering them; as soon as their solitude was profaned by the avalanche of civilization—which was perchance due to their own carelessness—the Todas began moving away to other parts as unknown and more inaccessible than the Neilgherry Hills had formerly been; they are not born of Toda mothers, nor of Toda parentage; they are the children of a very select sect, and are set apart from their infancy for special religious pur-

poses. Recognized by a peculiarity of complexion, and certain other signs, such a child is known as what is vulgarly termed a Toda, from birth. Every third year each of them must repair to a certain place for a certain period of time, where each of them must meet; their "dirt" is but a mask, such as a sanniyâsi puts on in public in obedience to his vow; their cattle are, for the most part, devoted to sacred uses; and though their places of worship have never been trodden by a profane foot, they nevertheless exist, and perhaps rival the most splendid pagodas—*goparams*—known to Europeans. The Badagas are their special vassals, and—as has been truly remarked—worship them as half-deities; for their birth and mysterious powers entitle them to such a distinction.

The reader may rest assured that any statements concerning them, that clash with the little that is given above, are false. No missionary will ever catch one with his bait, nor any Badaga betray them, though he were cut to pieces. They are a people who fulfil a certain high purpose, and whose secrets are inviolable.

It would seem from the above that they are not a race but a selected community, and that physical purity and perfection are among the qualities which it is desired to preserve among them. One can imagine that it may be important to preserve through degenerate ages a type of physical purity which might otherwise become extinct; and H. P. Blavatsky adds:

The Todas are not the only such mysterious tribe in India. We have named several in a preceding chapter, but how many are there besides these, that will remain unnamed, unrecognized, and yet ever present!

*The Pioneer*, an Indian paper, has an article on the Todas, giving such a description as H. P. Blavatsky refers to, and attributing to them the polyandry, the dirt, and other errors mentioned. But many points bear out H. P. Blavatsky's statements, as will be seen; we italicize the most important.

It says that some think they came over with Alexander, some think they are Greek, others Hebrew, others autochthonous. It describes what appears to be known of their habits and customs: that they live a pastoral life and do not congregate in towns or villages, but live separately in family homes. *In each home is a building superior in size to the others and generally surrounded by a wall. Todas consider this building sacred and will not allow Europeans to go near it, for inside is carried on all the process of their sacred dairy work, making butter, turning it into ghee, etc., and the entrance of any but a Toda would pollute the presiding deity.* The only animal they breed is the buffalo.

The buffalo is a friend to the little Toda boy, who tells him all his trouble, nestling up to him the while, and as the boy grows to manhood the importance of looking after his buffaloes before everything else grows upon him.

Both men and women allow their hair to grow seven or eight inches long. Their hair is jet black and very soft. Their eyes are full and speaking. They have beautiful aquiline noses, and fine white teeth. They are a cheerful and good-humored people but very lazy.

*They have no luxuries and flesh meat is never touched.*

It is difficult to say what the Todas really worship, for *they will never talk on the subject. It appears that the sacred dairy is their holy tabernacle.* It is divided into two compartments. In one is performed all dairy work; in the other an idol is kept. . . . Todas greet the moon and the rising and setting sun.

## Discoveries in Store at Memphis

PEOPLE with theories, religious, historical, or scientific, would better be careful not to commit themselves too far in certain directions, since discoveries are likely soon to be made that may alter our views. The systematic excavation of the site of Memphis, now being conducted, is sure to result in such discoveries. From a note in the *Scientific American Supplement* we take the following:

One of the most important enterprises in connexion with the operations among the buried and long-forgotten cities of ancient Egypt is the systematic excavation of Memphis, one of the greatest capitals of the Old World, about which comparatively little is known. Memphis long since vanished beneath the sand, yet it was perhaps the most important city of ancient Egypt since its history extends over the whole course of Egyptian history. It contained the finest school of Egyptian art, and in wealth was unrivaled.

But time has left few visible traces, and the ground on which it once stood is now farmed. The excavation is to be carried out as quickly as possible by the British School of Archaeology; and it is anticipated that fifteen years will pass in the excavation of the temple sites alone, apart from the city. These temples cover over 100 acres, which is greater than all the area of Karnak.

The principal temple was that of Ptah, a vast building originally founded by Menes, and rebuilt and added to by later kings. Adjoining this was the temple of Isis, and south of it the temple of the foreign Aphrodite due to the Phoenicians. On this last site it is expected to find the remains of the early civilizations of the Mediterranean during the prehistoric ages of Greece.

The ruins of these temples were standing up to 700 years ago, when they were dismantled to provide building material for Cairo. But the foundations and sculptures remain; and, judging from previous experience, they will be found in good preservation.

Findings during the past season have considerably widened our knowledge of the manners and customs of ancient Egypt. At Ghizeh the School of Archaeology has succeeded in tracing the first, second and third dynasties, and the civilization soon after the foundation of Memphis has been proved to be equivalent to that of the South at Abydos. The relics unearthed . . . antedate the dynasties of the Pyramid Builders by many centuries.

Other discoveries are mentioned, and the conclusion is arrived at that the past season's operations have been among the most prolific, varied and valuable in the work of the British School, and it has many years' work before it yet, even on this one site. STUDENT

## Positive Electricity

**I**N a recent address Madame Curie remarks that we have returned to the older conception of the two electricities, in some respects of different nature. The atom is composed of corpuscles, which are charges of negative electricity. It may lose some of these and yet remain, so far as we have determined, unchanged in its main chemical properties. What holds the bulk of them together within the atom?

This binding force is now considered as positive electricity. The atom is a sphere of positive electricity in which whirl the negative monads. After speaking of the latter, Mme. Curie says:

It is not the same for positive electricity, for a great dissimilarity appears to exist between the two electricities. Positive electricity appears to be always found in connexion with material atoms and we have no reason thus far to believe that they can be separated.

The current hypothesis sees disintegration everywhere. Every atom is radio-active, emitting waves of radiant energy. After awhile its corpuscles begin to get unruly and escape. When enough of them have escaped, the heavy atom becomes a lighter one—as when radium becomes helium. When light falls upon an atom it tends to disintegrate it. The escaping energy of a disintegrating atom is held to be disintegrative to those others upon which it falls. "Finally," all atoms will have been disintegrated; the universe will have been dissolved into the primal chaos of free electric (negative) charges.

The disintegration is obvious. But what of integration? That must be taking place now. At any rate it must have taken place whilst the atoms and the universe of them were forming.

Seeing that the binding force is positive electricity, whilst that which is bound is the negative, must not this same binder be and have been also the integrator?

The positive electricity is spoken of as a sphere, the sphere of the atom. If the atom is a sphere it is because the corpuscles are held together from a center as the planets are held together as a great sphere about the sun. It is therefore to the center of the atom that we must "look" for the positive electricity. If the corpuscles are immaterial charges, this is an immaterial center of attraction, the nucleus of the atom. The boundary of the sphere is as far as the attraction extends. It would therefore appear that one of the energies of Cosmic Formative Will is what we now call positive electricity. It is the point of constructive Thought in the center of the atom.

## The Roots of Species

**T**HE phenomena known as Atavism seem almost ready to be solved, or at least furnished with a partial explanation. Indeed one wonders how far the process may ultimately go.

Everyone who has kept mice in his youth must have noticed that occasionally his nests

of white ones will produce a black or gray one, a little creature eminently conspicuous among his fellows. His peculiarity does not appear, however, to trouble either him or them. It is a case of Atavism. How did it happen?

The offspring of a gray and a white mouse, if both strains are pure, are all gray. They do not appear to have taken any notice of the whiteness of their white parent. Nevertheless they *have* secretly noted it.

If two such mice, from two families, each of which though gray has a white parent, are mated, the white strain will reappear in its purity in some of their offspring. One out of four will be pure white with no gray, not even latent. Another of the four will be gray with no latent white. The remaining two will be gray but with a latent white streak which in future generations will sort itself out. In the end it seems that the sorting out process will be perfect.

Other modifications, due to environment, are also temporary. Plants taken from one place to another where the seasonal changes are different, will in a few generations adapt themselves to the new rhythm. But even these descendants prefer the old rhythm, and when taken back to the original home quickly revert to the old habit, sometimes at once.

The tendency in biology is to regard all suddenly appearing new species as reversions, sudden assertions of old rights on the part of latent elements, sudden revivals of old memory. The real species, once all the blends have been disentangled, we do not know. They may be very few. Changes in environment have produced countless changes—on the surface. Mixtures have produced yet others, just as numerous. But the original forms may remain ready to reappear with a return of the old conditions, and the separating process is always slowly going on.

## The Eye of Helmholtz

**N**EWSPAPER science still quotes the somewhat cheap and frothy saying of Helmholtz that if an optician furnished him with an optical instrument so imperfect as the human eye, he would promptly throw it back on his hands. The quotation is always connected with a glorification of modern science and becomes more conspicuously silly the more one dwells on it.

The truth is that the normal eye is exactly adapted to all that all but one man in a million wants of it. It is not a spectroscope or a microscope or a telescope because those demands have not been made of it. The eye shows its perfection precisely in that it has *not* those powers. Its perfection consists in its power and willingness to respond to demands upon it, and whatever scandal there is in its not having other powers tells straight back upon its owner.

Moreover it obviously surpasses in some respects any scientific instrument that ever has been or will be made. It is self-cleaning. It is self-repairing. As we look about the room and out of the window, it alters its focus to

our convenience and without our attention or notice many times a second. It is very mobile and responds instantly to the will. It co-operates intimately with the mind so that the two do not see what they do not want to see. If a speck of dust gets on the stage of the microscope with a high power, the work cannot go on. The eye agrees not to see dust or *muscae volitantes* unless we wish it to do so. If the balance of desirability were in favor of our seeing germs and spooks, it would quickly learn to do so.

And finally, if it is liable to disease and to imperfection in age, so, and more so, are scientific instruments. If, from its own standard, it is liable to imperfection needing artificial supplement, the blame is wholly with its owner and its owner's parents.

We might alter the saying a little: if we treated a scientific instrument as badly as we (directly and indirectly) treat the eye, we should *have* to send it back to the maker within a month.

## Arboreal Self-Surgery

**T**HE more we know of trees the more obvious becomes their natural intelligence. Some things are done uniformly by all trees; some are done by them as individuals, with a special eye to their individual requirements.

The autumnal fall of leaves looks like a waste of good material. But it is so managed as to use to the best advantage what is dead and what is living. First, the living material, sap and cell contents, is withdrawn into the stem to be housed for future use. The leaf is then strictly dead and must be amputated. At its base the cells begin to multiply and eat through the fibers connecting it with the stem. When they are all eaten the leaf falls off, leaving the cap of cells to seal the stem and prevent its "bleeding." On the ground the dead leaves, piled year after year, constitute at last a layer of decaying soil for the feeding of the roots.

But trees prune themselves not only of leaves, but in the case of some of them, of branches which they have decided to be useless. Here is a distinct act of individual judgment. The pruned branches are not dead, but the tree has decided that they are too weak to be useful or are superfluous. Either a layer of cells is formed like that at the base of leaves and the connecting fibers eaten through, or a disk of tissue at that point is made somehow very brittle so that the branch breaks off by the wind or its own weight, falling living to the ground. A New York botanical journal notes that during October of last year the sapling poplars of the Botanic Garden were so actively pruning themselves that the ground was littered with branches. Some trees select the spring for this remarkable process, some the autumn.

There are people who somewhat sentimentally fear that artificial pruning and the cutting of flowers is painful. Considering how little the trees mind doing surgical operations on themselves, fear seems groundless.

A VIEW IN THE PARK, GÖTEBORG, SWEDEN

**Forestry in China**

ACCORDING to a Consular Report, the first Chinese School of Forestry will shortly be opened at Mukden. The Empire is badly in need of such a School, for the mountains are denuded, and down their sides pour destructive floods, which cause immense loss of life and property. Also wood is scarcer than in any part of the inhabited world, though the country is well adapted to the growing of trees.

**The Land of the Holy Grail**

THE Holy Grail, destined to be discovered only by the pure and perfect knight, is a symbol whose analogs we shall readily discover in various sacred symbologies. For instance, "Cups" was the name of one of the four suits in the Tarot pack; the vase or gourd plays an important part in the myths of ancient America; Phoibos-Apollon, or Helios, arises out of a golden-winged cup; cup-shaped markings are common on the palaeolithic monuments; and so on.

The Grail Cup contained "wine," as the vase or gourd contained water, symbols of eternal life. The obtaining of this cup of immortality and bounty is only possible to the pure and perfect knight; monsters guard it from the weak and impure. An echo of this allegory of ancient Wisdom seems to have filtered through Scandinavia to England, there to be pounced on by the Christian Church,

which turned it into Jesus Christ's communion cup and averred that it had been brought to England by Joseph of Arimathaea. So knights in whom the ideas of perfection and purity had assumed a more material and martial aspect probably actually went out in search of a veritable chalice which they expected to find.

And there are various traditions as to where it was to be found. For instance, in the *English Illustrated Magazine* we find that:

About a mile from Tintagel, along the hilly road leading to Boscastle, and passing the wonderful little Bossiney cove with its elephant-shaped rock, there is a small rapid stream which winds through the Rocky Valley and falls like a torrent at low tide into the sea. The Rocky Valley, with its three huge boulders, its narrow walk now leading to the side of the stream and now mounting far above it, and ending only where the iron cliffs beetle above the roughest of bays, is one of the most sublime spectacles that Nature has to display in that enchanted region.

The scenery is a mixture of dark and frowning heights standing out with precipitous sides, and of green and gentle undulations amidst which sparkles ever and anon the tinkling sinuous brooklet. But it is not so much the valley, despite its manifold charms, as the little stream, which has a special interest for the pilgrim. By devious ways its course may be traced back through a rushy channel which lies deep and almost hidden between two sets of well-wooded hills until suddenly the traveler hears the sound of a sharp splashing from an unseen cataract.

The walk now leads upward to a small gate;

passing through the opening we descend once more a steep embankment and find ourselves at the water edge. It is a haunted, sequestered spot, shut in by the hills, overcast by shadows, the one sound the sound of the leaping stream. This is St. Knighton's Kieve, once regarded with a species of holy awe in Cornwall and believed, like most natural wells or "basins," to be under the special protection and influence of a saint. If we were to adhere strictly to Malory's narrative we should say that the quest for the Holy Grail began at Camelot. Local tradition, however, is privileged to depart from written records, and it happens that in this case the scene is transferred to this spot near King Arthur's birthplace.

We are asked to believe that the knights, standing with bowed heads in the Kieve, undertook the search for the Holy Vessel of the Last Supper, brought by Joseph of Arimathaea to this land, the Cup that had been hidden and lost, and was destined to be discovered only by the pure and perfect knight. The King, standing on the bridge of rock above the torrent, watched his reverent followers in the stream below laving their brows in its waters, listening to the music of the fall, and, full of the inspiration of the scene, making their solemn vows, and with a firm desire after righteousness, setting forth upon the quest. Lancelot and Bors, Perceval and Galahad, when in the wild woods far distant or among the ruined chapelries, when tormented by doubts and wrestling with foes, might be expected to recall that cool and shady gathering place, to see in a vision the flashing cascade, to dream of the crystalline brightness of the plunging water, and with renewed hope and courage to continue their hard task.

## KARMA

MAN'S the elm, and Wealth the vine;  
 Stanch and strong the tendrils twine:  
 Though the frail ringlets thee deceive,  
 None from its stalk that vine can reave.  
 Fear not, then, thou child infirm.  
 There's no god dare wrong a worm.  
 Laurel crowns cleave to deserts,  
 And power to him who power exerts;  
 Hast not thy share? On wingèd feet,  
 Lo! It rushes thee to meet;  
 And all that Nature made thy own,  
 Floating in air or pent in stone,  
 Will rive the hills and swim the sea,  
 And, like thy shadow, follow thee.

*Essay on Compensation, R. W. Emerson*

## The Responsibilities of Parenthood

TWO items from the papers may be quoted as illustrating the declaration of Theosophists that parents need to learn their duties. One is to the effect that a school for mothers has been started in a part of London. The other gives the experience of a man who traveled around the country schools in England, lecturing against the juvenile use of tobacco. He found three things: first, that the boys were ignorant that they were doing themselves harm, and were willing to give up smoking as soon as they knew; second, that the schoolmasters were everywhere alive to the evil; third, that he frequently met with the reply, "Our parents give us the cigarettes."

Instances like these—and they are but samples, as most people know—show that to worry so much about the schools is to saddle the wrong horse; and teachers know only too well how great are the obstacles with which they have to contend in counteracting what is taught to the children out of school hours.

The home is very sacred to people, and all schemes for abolishing it are naturally distasteful. Theosophists recognize to the full the sacredness of the home—nay they rate this sacredness higher than any ordinary rating. But privileges cannot be separated from duties; and it is because people have sought to enjoy their privileges without discharging their duties that much of the evils attending home-life have arisen.

Could the privilege of parenthood be regarded as the *initiation* into a higher order in the scale of life, an initiation into a life involving greater opportunities of self-mastery and self-knowledge, it would be better for both parents and children. But there is too little belief in the existence of such higher mysteries in life, too little faith in the prospects that lie hid in sleeping human nature, waiting to be revealed.

Social evils have many roots, and one may trace back this evil of the neglect of children to those roots in the infirmities of human

nature. Fortunately, according to Theosophy, these infirmities are not things to be confessed and indulged in before an excusing Deity, but things to be overcome by knowledge and effort.

First there is the ideal of marriage. When it is said that marriages are made in heaven, it means that unless a marriage is "made in heaven," it is (in a strict sense) no marriage at all but merely a legal union. That is, unless the partners have sanctified their union by pledges of mutual help in right living, then there has been no union in the higher sense. A true union would exclude the liability to self-indulgence, and its sacredness would safeguard continence—a virtue from which so high an institution as marriage was surely never meant to absolve. With such self-control all questions connected with "race-suicide" would not arise at all. There would be no acts the full outcome and responsibility of which the parents would not accept and fulfil. The duty to offspring would not cease with the bringing of it into the world.

But it is clear that the race must be educated as a whole in order that there may be the means of ensuring proper safeguards to entrance into the marital state. At present there is too much so-called "liberty"—that is, freedom to follow one's own lights—because nobody knows enough to be able to set up his opinion above those of others. The people naturally do not recognize the right of science or of sects to lay down for them laws of life; and they may prefer to rely on instinct, insufficient though that is. So, though we hear much of schemes for safeguarding marriage and dealing with the offspring, it is a case of the blind leading the blind.

To begin with we have no proper definition of a human being, of what is the Soul, or of what is the true end and aim of life. Therefore our philosophy on such questions as the marital state must necessarily be defective. Yet we need an understanding of these questions, because our evolution has gone too far for mere instinct or natural promptings to be a sufficient guide. Theosophy is the only source at the present day from which real help can be obtained, as the people will very soon find out by the sure test of its actual ability to give a practical solution for their difficulties.

Again, what is a child? It is first and foremost a human Soul, at a stage in its career, perchance far further on than its parents. Its childish form is but its temporary abode, under the laws of birth and rebirth. We must distinguish between the Soul within and the childish nature without, dealing with each according to its requirements. If we attend too much to the childish nature, then we are prone to use the child as a plaything and to keep it childish instead of helping it to grow. There are joys of parenthood; but the question for us is whether we can share the lowlier joys of humble folk who have not the responsibilities which our greater knowledge brings, or whether we should seek the higher joys arising from a realization that we are privileged to guard the entrance of a Soul into the world of material life.

STUDENT

THE future and the past are both included in each moment of our lives.—H. P. Blavatsky

## Infinite Possibilities of Human Progress

REINCARNATION is one of the key-notes of Theosophy, unlocking as it does the infinite possibilities of human progress. We are stunted neither in time or opportunity, for the unfulfilled desires and aspirations of one life are carried forward into the next for future fulfilment. In the light of Reincarnation we reach the full dignity of man's position in life as a responsible factor in the world's progress. As Souls, existing before birth, and not limited by the disappearance of the earthly form, we are ever at work weaving the endless chain of our future destiny—individually and collectively.

H. P. Blavatsky warned us strongly against the *only* Theosophical "heresy," the "heresy of separateness." The *Higher Self* is the Self of all creatures; and the reincarnating ego, the *Thinker* or Soul, is a Ray of the Universal Soul. The difference between man and man, lies not in the difference of his Higher nature but in the *degree of its manifestation* or control of the lower or personal, animal man.

With the Saviors of men the incarnation of the divine nature is complete and we see the manifestation of a God upon earth.

With ordinary men the voice of conscience urging towards noble deed is the partial manifestation of the divine. Our work is to unite our personal everyday consciousness with this "inner I" which ever leads us upward and along the path of duty. Through life after life the effort to identify ourselves with the overshadowing Spirit and dissociate ourselves in thought and action from the animal impulses and limited selfish notions of the personal man—such as the idea of holding possessions of wealth, honor, character, ability, for ourselves alone and not for willing *service* in the upliftment of our other selves—will bring us closer to our divine possibilities, until at last in some one life we too shall manifest on earth as Gods, and real Helpers of Humanity. It cannot be done by leaps and bounds, but step by step and "the passions"—taught H. P. Blavatsky—"killed in one life, like slain tigers, in the next cannot turn and rend you."

Reincarnation cannot be discussed very well without Karma the Good Law, bringing to all alike the result of past action, it is the method by which we reap as we sow. When the people of the earth widely recognize the truth of the Theosophical teachings of Karma and Reincarnation, we shall have a "new heaven and a new earth," and there will be no hard and fast line between them. So many practically do recognize them now, and so many of the next generation are being taught to understand themselves, that the "Star of Promise" now shines in the sky for the redemption of humanity.

Where shall we look for it? Wherever Theosophy is a practical power in the life of a human being, but pre-eminently at Point Loma the Central Heart of the Theosophical Movement whose energies now pulsate throughout the world under the guidance of Katherine Tingley our Teacher and Leader.

E. I. W.

It is only by close, brotherly union of men's inner Selves that the reign of Justice and Equality can be inaugurated.—H. P. Blavatsky

## LIFE'S WHEEL

LOOK nature through; 'tis revolution all,  
All change; no death. Day follows night, and night  
The dying day; stars rise and set, and set and rise.  
Earth takes the example. All to reflourish fades  
As in a wheel: all sinks to reascend;  
Emblems of man, who passes, not expires.—Young

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** In the maelstrom of conflicting theories regarding life and its purpose, and the relation between life and so-called death, what is the message that Theosophy has to give to the world? Can it give any certain light on the subject? What is the real life? Will you kindly take up this question in the Forum. (*Continued from last issue*)

**Answer** II. We have a kind of life that we share with the minerals, that is to say the mere physical existence and holding together of the particles of the body; of this there is a change with what we call death: these particles are disbanded and go on their own way. Then also there is the life in which we share with the vegetables, which causes the growth of our bodies. This, as Theosophy shows, is a great universal ocean of life which functions through our bodies, and is known when so functioning as *Prâna*. There are many meanings to the English word *life*, and confusion is apt to arise as to which of them may be meant; the advantage of this Sanskrit term is that it means just this one thing and no other.

Again there is that phase of life which we have in common with the animals; and there is human life, as it is commonly called, which includes the animal element and something more; and there is that other life mentioned in the phrase "Life is Joy"—a hard saying for many, as the thing it refers to is as yet a secret hidden away from most of us.

The sum total of human experience is too vast for treatment as a whole; we must analyse it a little, if we are to find out what we shall really call *life* and distinguish it from non-essentials. For this should be an ultimate thing, an element; it should be represented by only the most intimate and indestructible class of experience.

We go through our days with no great vividness or color as a rule. The ordinary events happen and apparently make little or no mark on our consciousness. The moments pass and are unremembered; we were not able to see anything in them that could clinch memory. This is almost the total of the life of millions. Here is the crude stone that is some day to be carved into a statue—for hundreds of years it has received no impression save such as can be made by the patter of raindrops or the brushing of insect wings. Indeed the humdrum events half noticed, and the moments that go and go from us, taking almost nothing as they go, unmarked by any impression of will or love, do little more to mold us than the raindrops and gossamer wings do to make the stone into a statue. In long ages the latter will no doubt be quite worn away by them; and long before life ends the unheeded moments will have dulled the godhood in us into unshakable quiescence and slumber.

Then something comes to rouse us, we "drink deep of the waters of life," as the

novelist says, which commonly means that the passions spring up and parade like a rabble army in the mind, with shouting and confused firing and tumult. Here there is motion enough that we never dreamed of; here the moments are all full and intense; there is color here, too, of a kind, something different from the old ditch-water monotone. The whole rant and fervor is burned into our consciousness, and the thing will be remembered—it will fight to force itself on memory. Indeed, you will never down or stifle it without will, perhaps long use of will. This is what we sometimes think of as *Life*.

But is it? Was that undisciplined mob really the army of angels? Are they marching to any high goal, is the way opened before them into eternity, is there anything ultimate or lasting about them, will they lead you beyond self, will they make you one with a nation or humanity, can they sweep your troubles away from you, can they beat your path into smoothness if you follow them?

We may take this simile from the passions, that real life when we find it will be as momentous and intense and vivid, or a thousand times more so, as the time marked by their fiercest dominance; but the whole intensity will of course be of an opposite kind.

Why is it that they came forth in that way, with all their clamor and bravado? To whom were they shouting their challenge, what power was it they were daring? That is the secret of the shock and intensity of it all—the noise was a challenge to one they knew should be their master.

"Ban, Ban, Ca-Caliban,  
Has a new master, get a new man."

It was just the monster, when Prospero was away, proclaiming his fealty to the drunken sailor. It was actually a challenge for you, and you felt it and stirred in your slumber, you being yourself an unripe Prospero, a King-magician to be. You were not aware perhaps that your subject had rebelled; nevertheless you were somewhat shaken and roused by the rebellion.

Then there is that other class of deep moments, when the full taste of life is perceived; but now, instead of the rabble, a sublime hero stands forth in the mind. A great deed of self-abnegation is done and the whole choir of angels is heard singing until the clamor of incident personal pain is drowned. Then too, the moment is clinched and will live on in the soul's memory; also it goes out and is vibrant through the world, even though it be, not the hero's or the martyr's death, but some common-day act of self-sacrifice that no one perceives. The bonds of personal self were broken then, and the breaker came upon a larger life, and without question, knew that it was joy.

All this may be true of extreme cases, you say, and what are extreme cases to the common worker whose days are unlighted by any change, who is neither a madman nor a hero? But extreme cases are often useful as bringing out into clear view the elements that go to make our living, and which, because of long usage, we do not notice. Ordinary experience is all potential tragedy, or else potential victory and heroism and apotheosis. The key to the problem is, that life in the highest sense is life impersonal. Root out the self-seeking

element from your acts and thoughts, and it must be that all your moments will glow with the light that shone through the hero's life and the martyr's death.

Stand not for self, but for the world, putting all your thoughts and feelings and deeds into that mold, and it must be that then you will know life in all its vigor, beauty and grandeur. Your Life is as boundless as the world's—and as everlasting.

Death is thought of as the end of life; and the life that is wrapped up wholly in one body or mind, must pass with death, must change. Our common lives are like the leaves on the tree, they will fall off and pass into the earth. If we knew nothing of the tree of which we are leafage, then death, the falling, would be the end of all for us.

But the life has but gone down to the roots, it has gathered knowledge of wind and sky, and will now rest during the winter. Itself, it was the tree always, and not the separate leaves, and is to appear again and send forth new shoots and new leaves in spring after spring.

K.

## Evolution and Illusion

**INQUIRER.** But who is it that each time creates the universe?

**THEOSOPHIST.** No one creates it. Science would call the process evolution; the pre-Christian philosophers and the Orientalists called it emanation; we Occultists and Theosophists see in it the only universal and eternal *Reality* casting a periodical reflection of *Itself* on the infinite spatial depths. This reflection, which you regard as the objective *material* universe, we consider as a temporary *illusion* and nothing else. That alone which is eternal is *real*.

**INQ.** At that rate, you and I are also illusions.

**THEO.** As fitting personalities—today one person, tomorrow another—we are. Would you call the sudden flashes of the *aurora borealis*—the Northern lights—a "reality," though it is as real as can be while you look at it? Certainly not; it is the cause that produces it, if permanent and eternal, which is the only reality, while the effect is but a passing illusion.

**INQ.** All this does not explain to me how this illusion called the universe originates; how the conscious *to be* proceeds to manifest itself from the unconsciousness that is.

**THEO.** It is *unconsciousness* only to our finite consciousness. Verily may we paraphrase St. John (i, 5), and say, "And (Absolute) light (which is darkness to us) shineth in darkness (which is illusionary material light); and the darkness comprehendeth it not." This absolute light is also absolute and immutable Law. Whether by radiation or emanation—we need not quarrel over terms—the universe passes out of its homogeneous subjectivity on to the first plane of manifestation; of which planes there are seven, we are taught. With each plane it becomes more dense and material until it reaches this our plane, on which the only world approximately known and understood in its physical composition by science is the planetary or solar system—one *sui generis* we are told.

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## An Old Custom in the New Forest, England

A CURIOUS old law surviving in the New Forest, England, is that relating to the rights attaching to the holdings; rights granted to the "commoners" in days of old, to gather bracken for fodder, or peat, or firewood, and to graze ponies and cattle and pigs. As a matter of fact, these rights do not attach to the holdings, nor to the families, nor to the houses, but to the hearth-stones. If a man moves from one part of the forest to another, he cannot take his rights with him, but must be content with those attaching to the hearth-stone of the new home. A cottage may become ruinous and unfit for habitation; and the owner may rebuild in another part of his ground, but he must leave the old hearth-stone in the old place, or his rights would vanish. Thus one sometimes see a hearth-stone standing in a field or yard, or built into a barn, that is, with the barn built on to it.

This calls to mind the reverence for the hearth-stone that held in Druidic Britain. Among the ancient Britons a sacred fire was kept alight on every hearth during the whole year; to let it go out would have been a calamity almost equal to the loss of the home itself. On a certain day in November the fires were all extinguished and the hearth-stones cleaned and scoured. In the evening of that day the Druid fires were alight on all the hill tops and sacred places in the island. They were lit with fire brought from other sacred fires, one of which was kept burning in each of the kingdoms or clan territories, which again were kindled from one sacred central fire.

On the evening in question, after fuel had been laid in each house on the clean hearth-

### MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

Druidic days. Perhaps there are many forces stored there from of old, golden forces connected with the higher life of the island, which wait to flame out and become potent in the national life when the right moment comes, and the deeper meaning of *pro aris et focis* is haply restored. K. M.

GLIMPSE OF THE NEW THEOSOPHICAL CENTER, NEW FOREST, ENGLAND

Lomaland Photo. and Engraving Dept.

stone, the householders took torches and marched with their families and dependants to the nearest hill-fire where, with rites and invocations, the torches were lit, after which came the return to the homesteads and the re-kindling of the hearth-fire with the torches for another year. Thus the fire on the hearth-stone was a link for each home with the general and spiritual life of the whole race, and the hearth a sacred place, a place of unity and divine life.

Can it be that in this New Forest custom we have a dim remembrance of the ancient practice? That part of England has probably changed but little since Druidic or even pre-

The only foundation for the foolish rumor was that the first legal papers embodying the transaction were faulty as regards certain technical points of Swedish law. The matter was immediately attended to, with the result as above stated, that on January 13, 1908, the ownership and title passed definitely to Katherine Tingley.

RECORDER

For a thing of this kind cannot be expressed in words, like other branches of learning, but by long familiarity and living together with the thing itself; a light as it were of a fire leaping forth will suddenly be kindled in the soul, and there itself nourish itself.—Plato

## The Visingsö Estate, Sweden

Katherine Tingley's Ownership confirmed by Swedish Law

ON February 12, 1908, word was received by cable from Torsten Hedlund, Katherine Tingley's business representative in Sweden, that the ownership by Katherine Tingley of the estate recently purchased by her in Visingsö, on Lake Vättern, in that country, dated according to Swedish law from January 13, 1908.

It may be remembered that the public press, some little time ago, published reports emanating from sources antagonistic to the work and plans of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, that Katherine Tingley had been unable to secure legal rights of ownership over this property.

## LAST SUNDAY AT ISIS THEATER

Prof. H. T. Edge Continues his Address on  
Theosophy and the Bible

A LARGE and very attentive audience listened with evident interest to the lecture given last Sunday night by Mr. Edge on the above subject. Mr. Edge said in part:

Friends, tonight I propose to speak to you about some of the sayings of Jesus Christ which are reported in the Gospels. But first of all I wish to say a word about the versions of the New Testament. The version most used is known as the English Authorized Version, and it was the work of many hands. The work of translation began in England with the version made by Wickliff, assisted by Nicholas of Hereford, in 1382. The form in which the New Testament has been read for nearly three centuries was the result of various revisions between 1382 and 1611, at which latter date the version known as the Authorized, or King James' Version, was issued.

A revision was resolved upon in 1870 by the Convocation at Canterbury; and after the labors of ten years this revision was (New Testament) published in 1881, and in 1884 (Old Testament). It was the combined effort of many learned men in various countries, as America, Germany, Great Britain and elsewhere. The general rule laid down was to adhere to the version of 1611 except where actual errors demanded a change. The result is a rather conservative version, but on the whole a decided improvement in point of accuracy upon all existing versions, or translations.

I propose to notice now some of these changes, as that in Matth. xxiv. 3-27: "And as he sat upon the Mount of Olives, the disciples came unto him privately, saying: Tell us, when shall these things be? And what shall be the sign of thy coming, and of the end of the world? And Jesus answered and said unto them, Take heed that no man deceive you. For many shall come in my name, saying, I am Christ, and shall deceive many. And ye shall hear of wars and rumors of wars: see that ye be not troubled: for all these things must first come to pass, but the end is not yet. . . . If any man shall say unto you, Lo, here is Christ, or there; believe it not . . . for as the lightning cometh out of the East, and shineth even unto the West, so shall also the coming of the Son of Man be."

Now we find in the Revised Version several alterations, the most important being that instead of the "end of the world" (*συντελείας τοῦ αἰῶνος*), we have the "consummation of the age"; and instead of "thy coming" (*τῆς σῆς παρουσίας*), we have "thy presence." The question is, why did the translators of the Authorized Version give "end of the world," and "thy coming," instead of the more correct form which we have in the Revised Version? Was it not because they had theological notions about those things and made the translation correspond to their conception? According to the teaching of Theosophy (H. P. Blavatsky) —

"The coming of Christ means the presence of Christos in a regenerated world. This Christ is to be sought neither in the wilderness nor in the inner chambers, nor in any temple or church built by man; for Christ . . . the true esoteric Savior . . . is no man, but the DIVINE PRINCIPLE in every human being. He who strives to resurrect the Spirit crucified in him by his own terrestrial passions and buried

deep in the sepulcher of his sinful flesh; he who has the strength to roll back the stone of matter from the door of his own inner sanctuary, he has the risen Christ in him. The Son of Man is no child of the bondwoman . . . flesh, but verily of the freewoman . . . Spirit, the child of man's own deeds and the fruit of his own spiritual labor."

From this we see that it is pretty clear Jesus was not speaking of any physical coming, but of the presence of the divine principle in humanity. In Matth. xvi. 28, Jesus says, "Verily I say unto you, there be some standing here who shall not taste of death, till they see the Son of Man coming in his kingdom." And in Luke xvii. 20, 21, Jesus replies to the Pharisees, "The kingdom of God cometh not with observation (or with outward show): neither shall they say, Lo here, or, lo there! for behold the kingdom of God is within you." In these passages Jesus refers to the spiritual awakening of the Christos in man, or in humanity, and not to any physical circumstance. It is not accompanied by "outward show," but is imperceptible, and all-pervading like the advent of Spring.

There are some very important texts which are too often overlooked, such as Matth. vi. 33: "Seek ye first the kingdom of God and his righteousness, and all these things shall be added unto you." And in John viii. 32: "Ye shall know the truth, and the truth shall make you free."

Now that is a text which is directly in harmony with Theosophy. Theosophy teaches that it is by the power of Truth that the mind of man is made free. As we find out and overcome our delusions by the light of Truth, the real self in us grows and dominates the whole nature.

Another passage relating to the same thing is in John viii. 34-36: "Verily I say unto you, whosoever committeth sin is the servant of sin. And the servant abideth not in the house for ever, but the Son abideth for ever. If therefore the Son shall make you free, ye shall be free indeed."

Here we are taught that the immortal part of man is the Son, or Christos, "which abideth in the house for ever"; and we are told that true freedom comes through the rule of the better self in man — "If the Son make you free ye shall be free indeed."

In Matth. x. 39, we have the words, "He that findeth his life shall lose it; and he that loseth his life for my sake shall find it."

This is a very ancient teaching. We find similar words given by the various other Christs of the world: namely, that there is another kind of life in store for man, and that as man loses his lower life he attains to the fuller and larger life.

Another important passage is in the Sermon on the Mount, Matth. v. 48, where Jesus says, "Be ye therefore perfect, even as your Father which is in heaven is perfect." Now, that is in flat contradiction to the teachings we hear from so many pulpits, which tell us we are so many "miserable sinners," and that salvation is something which has to come to us from the outside. But here we are told by Jesus that perfection like to our Father in heaven is possible for us, and is, therefore, the goal which we should seek. Bearing on the same subject is another well-known text, John xiv. 12: "Verily, verily, I say unto you, He that believeth on me, the works that I do shall he do also, and greater works than these shall he do; because I go unto my Father."

There Christ speaks in the first person, and we find that in the Gîtâ Krishna uses the first person in the same way. It is the higher man, or the Logos

that speaks. And from that Jesus says, the works that he did we shall also do, and greater works shall we do. He does not claim any exclusive possession of power to himself, but declares that his disciples share his powers, and his nature. Still further Jesus says, "I will pray the Father and he shall give you another Comforter, that it may abide with you for ever; even the spirit of truth: whom the world cannot receive, because it seeth it not, neither knoweth it; but ye know it; for it dwelleth with you, and shall be in you."

From this we learn that the disciples had this spirit of truth, but the world could not receive it, because it did not see it. Such passages show that Jesus was speaking of the Christos in man: the Christ-principle which gives that inner enlightenment. There are many ministers now who accept this view, but they cannot teach this and yet bind men down to Christian tradition. We are told that by following the law of the divine nature incarnate in us, and subduing and keeping in place the animal nature, that we shall attain to wisdom, freedom and happiness. This is simply the ancient Theosophical teaching. At the center of our being is the Divine influence; we can call it into activity by aspiring in our heart and mind, and by purifying our lives so that we may manifest it. Thus we render the real Self conscious in us, and by its power we take control of the lower nature.

There are none of us conscious of the purpose of the Higher Self. A great many things in life perplex us, and are misunderstood, because we do not know the working of the real Self. We feel that the real person is leading us through life, in spite of the fact that we cannot grasp the meaning or purpose of things. We often call this "fate," but it is simply the will of the real Self within us, and we often do not understand, and resist it. The desire for progress, for enlightenment, for wisdom, etc. dwells in us now, and these come from the real Self. This is what Theosophy means when it teaches us of the real man in us. Jesus and the other great Teachers had sounded the depths of their own being, and had united the lower consciousness with that of the Divine Self in us. We are limited by our want of knowledge, but we may attain to the real Self-Consciousness by the exercise of all the noble qualities. What a contrast there is between this teaching and that of "personal salvation"! How different is this from that spirit of commercialism which we find pervading religion! Christ teaches self-sacrifice, self-forgetfulness, as in Matth. xvi. 24-26: "If any man will come after me, let him deny himself, and take up his cross and follow me. For whosoever will save his life (or *psyche*) shall lose it; and whosoever will lose his life for my sake shall find it."

Another important passage is that where Jesus says, "Except ye be converted and become as little children, ye shall not enter into the kingdom of heaven." (Matth. xviii, 3) Jesus has a great deal to say about the kingdom of heaven, or of God; and in another place it is said to be *within us*. We have not fitted our minds to enter this kingdom until we become as little children. At present our minds are not simple enough; not trustful enough.

Much has been said and written about that saying of Jesus, Matth. xxv. 46: "These shall go away into everlasting punishment; but the righteous into life eternal." The Revised Version reads *eternal* in both cases, as the original Greek in both cases has the same word *αἰώνιον* — which means *age* long, not eternal. There are many who have gotten rid of

the old doctrine of *everlasting* hell, and who are ready to accept the teachings of Theosophy in this matter.

Another important passage is that which records the conversation between Jesus and Nicodemus, John, iii. 3: "Verily, verily, I say unto thee, except a man be born again, he cannot see the kingdom of God." Nicodemus says, "How can a man be born when he is old?" Jesus answered, "Verily, verily, I say unto thee, except a man be born of water and of the Spirit he cannot enter into the kingdom of God. That which is born of the flesh is flesh; and that which is born of the Spirit is Spirit."

This second birth is a very old symbol. It is a method of speech used in the Mysteries. A man is born again when he awakens to a recognition of his Divine Nature, and takes the vow taken by candidates for initiation to accept the Divine Presence as his future guide in life. Then a veritable second birth takes place in him; he is not the same as before. "That which is born of the Spirit is Spirit." Then he enters the "Kingdom of God."

To continue: "Marvel not that I said unto thee, ye must be born again. The wind bloweth where it listeth, and thou hearest the sound thereof, but canst not tell whence it cometh and whither it goeth: so is every one that is born of the Spirit." The word translated "wind" is the same word that is afterwards translated Spirit (*pneuma*). The Revised version has the marginal reading "The Spirit breatheth where it listeth." The Divine influence was always described as a breath, or a wind, or an air. In a similar manner the word "water" is used in this same chapter.

"No man," says Jesus, "hath ascended up to heaven but he that came down from heaven, even the Son of Man who is in heaven. And as Moses lifted up the serpent in the wilderness, even so must the Son of Man be lifted up; that whosoever believeth in him should not perish, but have everlasting life."

It is sad to think how much this has been doctrinized, especially as taken along with that other passage: "God so loved the world that he gave his only begotten Son, that whosoever believeth on him should not perish, but have eternal life."

We have here an instance of the Divine Self in man speaking; but it has been turned into a soul-killing dogma, a dogma which quenches in man the light of the soul, the consciousness of his divinity, and makes him feel that he is destined not to reach the goal, and that his salvation must come from without, instead of from the power of the Christ within. I shall read you a quotation (CENTURY PATH 9th Feb. 1908, p. 3.) which illustrates the position of the orthodox ecclesiastic. . . .

Here we find that orthodox teaching inculcates a feeling of hopelessness, of despair. Man is destined "never to reach the goal appointed for him"; and his salvation must come from without. As opposed to this, Theosophy teaches that man is a soul, and that by the power of the Divine Spark, the Christ within, man overcomes the lower nature. "Christ in you the hope of Glory," is the teaching of St. Paul, and of Theosophy.

The lecture concluded with a quotation from a conversation of Thomas Carlyle which showed Carlyle to be in close accord with the teaching of Theosophy:

"This strange human life of ours passes not merely through mystery to mystery, but from God to God. . . . The meaning of life here might be defined as consisting in this—to unfold yourself, to work what thing you have the faculty for . . . there is a perennial nobleness and even sacredness in work."

We need to read more of the thoughts of such great men; and if we can imbibe a little more of their spirit we shall be able to interpret the sayings of Jesus in a more rational way than can be found in the theological glosses. OBSERVER

### Scientific Faddism

NO science is worthy that exalted name, unless it has a direct practical bearing on the cause of real human progress. Otherwise the name "science" is a misnomer. Theosophy is ever insisting upon the sacredness of true Science.

And Theosophical ideas permeate the mental atmosphere of the world. For instance, we find the editor of a journal of sociology saying (according to the *Literary Digest*, from which the quotations are taken) that no social science is worthy of the name which does not deal with human personality. He sent out to twenty-seven leading sociologists a paper asking them questions on this point, but got only six replies. The other twenty-one could not have been much interested in the question; and from the six replies received the sociologist concludes that they show "a prevalent contempt for live questions on the bearings of different parts of social science upon one another." Each student is interested in his own narrow range of studies.

To quote:

There is one question, and one only, which in the last analysis gives social science under any name first-rate dignity. However we may phrase the question, it amounts to this: What is potentiality in human beings, and how may human beings who have begun to be conscious of themselves make the most headway in realizing these possibilities? So far as I am able to see, this question is closer on the track of the last meaning we can discover for life than any other.

I can see nothing but hysterics in any human activity whatsoever which is not in some way contributing its quota towards answering this question. Sciences all seem to me so many triflings with capricious conceits about life, unless each in its way is co-operating with all other investigations of human experience in working out the completest report possible upon the main question. In the last resort, the place of any science in the gamut between triviality and importance must be fixed by the degree of its participation in this co-operative inquiry.

Behind all the faddism is "indifferentism or agnosticism" about any main meaning which gives the incidents of life a scale of values. And he continues:

We either do or do not believe that there is an underlying moral economy which it is the interest of all mankind to know. . . . The attitude of the social scientists in the United States points to a considerable preponderance of opinion that the idea of an underlying moral economy in the affairs of men is a myth.

Thus people are hungering for bread and getting stones. Another illustration of the same point is the remark made recently in a conference of science masters in England, that there seemed to be a relapse from the great boom in science teaching in schools of a few years ago and that mathematics was also in a bad way.

What is the "underlying moral economy which it is the interest of all mankind to know"? Probably there is more of it to be discovered in literature, history, and the ancient classics than in courses of physics, chemistry, and biology; and that is why the pendulum is swinging back to the old subjects. Certainly there is no longer the triumphant "cocksureness" with which science came before the world last century as the great solu-

tion of all riddles. We need more perspective in our views of human thought; the intimate familiar human questions outlast all these fashions.

The fact remains that the people find themselves delivered over to a host of guessers and speculators and faddists who reveal their own ignorance and incompetence. And what must be the result of such leadership? With the old ideals and faiths of our fathers destroyed and no longer effectual, and nothing but miscellaneous speculations in place of them, what must be the effect upon practice?

The answer is that the difficulties now besetting nations will grow more acute and urgent, until at last the people will be obliged to look for light where they can see it, and turn for help to that source which can afford it. Then they will ask to know the secret by which the members of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY are able to attain a unity of aspiration and achievement to be found nowhere else, to solve problems in daily life which for others are insoluble, and to find rest for their souls in the gaining of a permanent ideal and purpose in life. It is the demonstration that will convince them, the contrast between this harmony and the outer conflicts.

But the true Science, which makes such harmonious conditions possible, is a harmony of all the other sciences, not made by artificially blending them, but the unity from which the various branches have sprung. Truth is one, but opinions are many. Knowledge and conduct are inseparably connected; the ideal which the candidate for Wisdom sets before himself is an ideal of *duty*. He seeks to develop from a pigmy into a Man, and to realize that his life has its source and its meaning—not in the personality, but in the Real Self which is from above. To this Divine source of his being he aspires, seeking to render his life more impersonal and nobler and stronger in every way, while reverently sensing the beauty and sublimity behind manifested nature and the possibilities of human perfectibility. Under the inspiration of such motives comes the knowledge that counts and is worth having. STUDENT

### Clipped from the Press

IN severing our connexion with the SOUTH PASADENAN, there is nothing we will miss more than the weekly visits of that grand good paper, the CENTURY PATH, published by Mrs. Katherine Tingley at Point Loma. It is, we firmly believe, the one publication upon the face of the earth that publishes every week, without a miss, more good, common sense truth, than any other publication. And if the reader finds something in its columns that he is inclined to doubt, he has but to investigate, when he will find that he, and not the CENTURY PATH, was mistaken. It is of itself the greatest educational work we ever saw. Of course we will greatly miss the other weekly papers with which we have so long and profitably exchanged, but they are all somewhat similar in tone, while the CENTURY PATH stands in a class by itself and is well worth the price of four dollars a year that is necessary to obtain it.—*Pasadenan*, South Pasadena, California, Jan. 30, 1908.

# Art Music Literature and the Drama

## Our Poets and the Power of the Ideal

ONE proof of the reality of the ideals sung to the hearts of men by our poets is the way in which they meet death. The bequests of high ideals to those who openly voice them are many, but the one thing that they seem almost certain to bequeath, in spite of the taint of pessimism or personality in any form, is a gentle, sweet, serene faith that "all is well," that death hath no victory—a faith that becomes an actual and living power in the life. Many records have been preserved to us of the words uttered by our poets at that golden and wonderful time when the veil is lifted between this world and the next and when they know that it shall not fall until they have passed beyond its borders. It is the hour of proving the faith that has lain in their hearts like a message of living light and whose burden it has been their life-work to utter. And the test is met again and again, must be in every case where the heart is sincere and where the soul has not been hawked in the market-place or street. The following accounts, sent in by a student, are of especial interest because of the heart-touch in the lines no less than for the real love borne by the writer for Whitman whom she had known.

And then that remark of David Swing's! Was it the nearness of the greater life that made it possible for him to forget what heresy-hunters had made him suffer, and remember only the absurdity and the humor of a long series of persecuting attacks? Perhaps so. Different as are the two men they are well spoken of together; both courageous, though one had the spirit of a robustious warm-hearted soldier and the other that of the quiet and sincere lover of his fellow men; both were persecuted, but both grew patience and sweetness and manly strength under the hail and rain of unbrotherly and wholly unjustified denunciations, and both left writings breathing the love of the ages. Both truly loved their fellow men.

Swing's sermons take one into the atmosphere of nature and love of man, sweet and quiet and calm, while Whitman stirs up the soil at the very roots of this forest-growth we call life. What might they not have seen and sung had they known Theosophy? Yet much of its light they did find in penetrating the clouds of doubt and surmounting the inner rebellion that persecution so naturally begets, and when death came they met it in a light-some mood, as a comrade to lead them further.

During his last years the poet, Walt Whitman, became a nearly helpless invalid and entirely dependent for his support upon the contributions of his admirers. A few months before his death Robert Ingersoll gave a lecture in Philadelphia the proceeds of which added a large sum to the fund that was to make the declining life of the poet more comfortable. On this occasion the paralytic was brought over from his home in Camden and, surrounded by a large circle of friends, remained seated in his wheeled chair on the stage while Ingersoll with his usual eloquence discoursed on the beauties of the

Whitman literature, classing it with that of Shakespeare. After the lecture the audience requested that the poet be brought forward, but his only remarks were to the effect that he had delivered his whole message and should now say but: "Hail! and Farewell!"

A little informal supper was then arranged, at which the two great geniuses conversed together for more than an hour. In Quaker fashion they addressed each other by the first name. "What I like best about you Walt," the orator declared, "is that you don't sail off into the ether, but confine your words to the affairs of earth and its people." The poet smiled a little reproachfully as he responded, "I don't know about that, Robert. I think that I soar a good deal." "Well perhaps, after all, you do, Walt," came the quick reply; "but you know that whenever you do get up there, (here the speaker pointed to the ceiling) you always take a good lot of earth along with you."

This was the last public appearance of the Poet of Democracy. He died soon afterward, "a bird still singing in his heart," his mind so perfectly attuned to Nature's decrees that when, during the illness which was to end his life, the doctor declared he could not tell whether he might recover, he quietly replied, "It is all right either way."

## From PROSPICE

ROBERT BROWNING

FEAR death? to feel the fog in my throat,  
The mists in my face,

When the snows begin and the blasts denote  
I am nearing the place,

The pow'r of the night, the press of the storm,  
The post of the foe;

Where he stands, the Arch-Fear in a visible form,  
Yet the strong man must go:

For the journey is done and the summit attained,  
And the barriers fall,

Though a battle's to fight ere the guerdon be gained,  
The reward of it all.

I was ever a fighter, so one fight more,  
The best and the last!

I would hate that death bandaged my eyes, and forbore,  
And bade me creep past.

No! let me taste the whole of it, fare like my peers,  
The heroes of old,

Bear the brunt, in a minute pay glad life's arrears  
Of pain, darkness, and cold.

For sudden the worst turns the best to the brave,  
The black minute's at end,

And the element's rage, the fiend-voices that rave,  
Shall dwindle, shall blend,

Shall change, shall become first a peace out of pain,  
Then a light, then my breast,

O thou soul of my soul!

I shall clasp thee again,

And with God, and with God be the rest!

Shortly before the death of Professor Swing, when in conversation with his colleague, Dr. Thomas of the People's Church, Chicago, the latter referred to the famous [infamous, rather] trial which his friend had undergone in previous years for heresy. "The most curious part of that affair to me," the Professor remarked, "is that I should have taken it seriously. Whenever it is mentioned to me now I can only smile!"

STUDENT

## An Original View of Bach's Music

SAYS M. Albert Schweitzer, in his interesting book, *J. S. Bach, le Musicien-Poète*:

Bach has a vocabulary of his own, as it were, of musical expressions, which always recur in the same form in all his works, in the Passions and the cantatas as well as in the chorales. For this or that idea, he has this or that invariable expression; when the same idea recurs, the same musical formula recurs. In the *Capriccio*, on the departure of a brother, the elements of this musical language are already clearly seen. The Lament, for example, is typical of the way in which Bach will express in his cantatas and chorales all the *nuances* of grief. For quiet grief . . . he will always employ a motive in quavers or semiquavers going in pairs; . . . for acute grief, broken with sobs, as it were, he will use a motive irregularly syncopated; . . . for acute grief, a chromatic motive of five or six notes. And as each of the friends witnessing the departure of the brother feels one of these orders of grief, the Lament comprises them all. . . . These fifty bars make an epoch in the history of descriptive music; it is the first time such precision of language occurs. II.

Shun him who secretly slanders: he is like a cup of  
poison with cream on the surface.—*Gems from the East*

### "Who goeth on his Head to Save his Feet"

CELTIC mythology mentions one Penpingion, a porter at Arthur's court, who, as the story says, "Went upon his head to save his feet, neither towards the heaven nor towards the earth, but like a rolling ball upon the floor of the court."

There is the broad humor and wide-sweeping breath of the old Celtic romances in the description, but the type is quite true to life. Thousands of us habitually go on our heads to save our feet, and perhaps try to do our thinking with our pedal extremities, as, for instance, in the domain of natural science the materialists, who will advance and uphold the most preposterous and impossible theories in order to avoid any recognition of the human soul, or the spiritual nature of the universe, or anything that might tend towards mysticism. A recognition of these facts would explain acres of what is now inexplicable to them; it would be "feet" for traversing leagues and leagues on the road of knowledge; but they, good easy people, prefer to roll about on the "heads" of materialistic theories, and progress truly "neither towards heaven nor towards earth." And there are the credulous of all kinds, the class on whose weakness certain sham occultists continue to flourish.

Our physical and mental troubles and weaknesses are curable in the long run by one method alone, as every real Teacher has shown the world, and as common sense declares, namely, Brotherhood and right living, for the two are in reality one. But no, we will have hypnotism, breathing exercises, lessons in "occultism"—at so much in dollars or guineas a lesson—and so on. We will have plans and schemes most brilliant, we will build a new Babel tower, invade the moon,

do God knows what as a means of progression along the path—but for pity's sake do not let us put the right foot out and plant it firmly and then advance the left beyond it and then plant that, and so go on!

It is the Will-o'-the-wisp of human nature, this tendency to be finding new schemes of salvation when any old one fails, and never to find the simple right one that begins at one's own door. One might come on it at last by exhaustion of the wrong ones, only they never are exhausted, or else we forget

### From NUREMBERG

Longfellow

IN the valley of the Pegnitz, where across broad meadow-lands  
Rise the blue Franconian mountains, Nuremberg the ancient stands.

Quaint old town of toil and traffic, quaint old town of art and song,  
Memories haunt thy pointed gables, like the rooks that round them throng:

Memories of the Middle Ages, when the emperors, rough and bold,  
Had their dwelling in thy castle, time-defying, centuries old.

And thy brave and thrifty burghers boasted, in their uncouth rhyme,  
That their great imperial city stretched its hand through every clime.

In the court-yard of the castle, bound with many an iron band,  
Stands the mighty linden planted by Queen Cunigunde's hand;

On the square the oriel window, where in old heroic days,  
Sat the poet Melchior singing Kaiser Maximilian's praise.

that we have traversed them towards nowhere before, and take them up again, and so on through the whole round. Only Will and a sane facing of oneself can break one of the habit.

Poor Penpingion! Says the Mabinogi: "he was a man, Heaven knows, from whom no one ever got any good." And the world—how filled it is with Penpingions! people from whom neither their families nor society in general "get any good"; people who perpetually stand with their backs to the sun and then groan over the shadows. How one wishes there were not so many of them. STUDENT

### Nürnberg and the Bridge-Spanned Pegnitz

"EIN' feste Burg ist unser Gott," sang the militant German poet-preacher four hundred years ago, and the aptness of the metaphor characteristic of the Middle Ages strikes one afresh as he enters the doors of old Nürnberg and sees its "mighty fortress" towering above the city at its feet. The Burg is a dominant note in Nürnberg, as it is in other German towns, and creates at once upon beholding it, the atmosphere of other days. But this relic of the old outworn feudal system is by no means the only source of Nürnberg's picturesque as a city. For flowing through its heart, dividing it into almost equal parts, is the River Pegnitz.

The Pegnitz is usually a gently flowing little stream and not very wide; but it adds immeasurably to the witchery of the old Gothic city. Once it served as its keep, and a rough-hewn square tower still stands on its banks to mark the line of the old bastion. As the city grew in importance it stretched across the Pegnitz and an outer encircling wall was built. This outer wall stands today like a wizard's ring holding the charm of a bygone time. In one place the wall itself crosses the Pegnitz on stout well-built arches.

The Karlsbrücke, the bridge shown in the illustration, is but one of the many charming bridges that have been thrown across this intramural waterway. These picturesque bridges, some of which are only footpaths—"Stege" they are called—lend to the cold northern city something of the charm that Venice owes to her canals. Indeed the tie between the Gothic Athens and the Bride of the Adriatic was very close in the old days when the great

high road bound them together and rich traffic flowed between. Nürnberg's builders and artists often wandered southward to Venice, and architects from Venice came to Nürnberg to assist in the embellishment of the patrician city. The Italian influence is felt in the bridges, in some of the galleried courtyards of the family houses, and even today one sees Venetian blinds opening outward to let in the paler sun of the north. The Henkersteg or Hangman's Bridge, that sad relic of cruel days, is built like the old Rialto, and was a veritable Bridge of Sighs, for over it the condemned walked on their last journey.

No such gloomy memories haunt the old Butcher's Bridge, now one of the busiest thoroughfares of modern Nürnberg. It calls to mind, rather, the days when even the butchers took an honest pride in their trade guild-hall. The giant stone ox still stands and proudly claims a guard over the "butcher's house" and under it we may still read the quaintly humorous Latin legend which declares that this ox was never a calf! Even the city scale, in those days when art and industry went hand-in-hand, was ornamented with a fine stone relief by Adam Kraft. Another crowded modern thoroughfare is the old Museumbrücke, a charming place at which to pause and muse during the quieter hours of the day. From this bridge

Lomaland Photo. and Engraving Dept.

VIEW OF OLD NÜRNBERG, SHOWING THE KARLSBRÜCKE OVER THE PEGNITZ

we have a fine view of the old Spital Kirche and the neighboring houses, built down to the water's edge. The church itself is built across the Pegnitz on two low-vaulted arches. It does not entirely span the river, but one side rests on a bit of boat-shaped land grown high with trees which break the severe line of the plain oblong building with its high, red-tiled roof. A slender spire, rising from one wonders where, adds variety to the sky line on the other side. The severity of the plain façade is broken by that charming device, beloved by Nürnberg builders, the oriel window or Chörlein—"little choir"—as it is called by the Nürnbergers. In this quaint church whose time-softened colors are reflected in the quiet waters of the Pegnitz, was once held the royal insignia, the *Reichskleinodien* of the Holy Roman Empire. These were kept in a stout casket which was fastened by a heavy chain to the ceiling.

This Spital Kirche is on the island, Schütt, which divides the river Pegnitz into two branches thus giving abundant water frontage and splendid opportunity for civic adornment in the way of bridges. On Insel Schütt are some of the oldest and most picturesque houses in Nürnberg. They form a wall in some places, on the river's bank, yet each house is distinct and characteristic. Some are built gable-end to the water, and the red-tiled roofs seem to be tipped over the points as if to soften their sharpness. Others, built broadside to the riv-

er, have richly carved overhanging wooden balconies stretched across the façade not unlike the rich bands of embroidery that were so loved by the Germanians to embellish their long flowing garments.

Thus we see that the River Pegnitz divides Nürnberg into two parts, the north side and the south side. To the north of the Pegnitz rises the Burg, its grimness softened by the mass of foliage in which it is embowered. Just down the hill from the Burg is the home of Albrecht Dürer, rich with memories of the greatest of the Gothic artist-craftsmen. On this side is the great Marktplatz, and in the splendid Bürgerhaus that fronts the square the humanist Pirkheimer lived. Here stands the quaint stone pile known as a Gothic Pyramid, called in Nürnberg, which is a city of beautiful fountains, The Beautiful Fountain.

And here also is the unique Frauenkirche with its richly adorned projecting portal, fine graduated gable, and wonderful old clock.

It is easy to picture this Market place teeming with the many-hued life of the Middle Ages, when all the countryside farms, hamlets, and villages, poured their varied wealth into Nürnberg's doors for her sustenance and upbuilding, carrying back to remote farmhouses, where they may still be found, objects of use and beauty made by Nürnberg artisans and craftsmen. Not far away is the Rathaus, built at that happy moment of the union of the Gothic and Renaissance styles and it shows the most charming features of both. Then there is that quaint little inn, plastered like a swallow's nest against the side of the Moritz chapel, its little bell-sign still swinging as in days gone by when merchant princes, artists, and poets sought its modest shelter for the sake of the savory sausage dispensed at the "Bratwurstglöcklein." Last of the great landmarks to the north of the Pegnitz is the church of St. Sebald, from which the north side of the Pegnitz receives its name, the Sebaldusseite.

The south side of the Pegnitz boasts the St. Lawrence church, and in consequence is called the Lorenzseite. Many of the finest examples of *Bürgerhäuser* adorn this quarter of Nürnberg, and here also is the Germanic Museum, the real *Schatzkammer* of the German nation. For here are treasured, not

the crown jewels, but some of the most splendid works of German art and industry produced during the course of the centuries, the fairest jewels in the crown of the Fatherland. Here also is preserved the original manuscript of Wagner's *Die Meistersinger*, that rich arabesque of music, verse, color, and action, at once romantic, grotesque, and noble, that presents such a faithful picture of the teeming life of Nürnberg's *Blütezeit*. A DAUGHTER OF NÜRNBERG, NOW IN LOMALAND

### Jottings and Doings

(Gathered by H. H.)

A CALIFORNIA woman, well-known for her feats at mountain climbing, has recently added to her record of adventure by being the first to explore the famous cave situated in the State of Massachusetts near Worcester. The

many attempts which have been made to enter this mysterious "Purgatory Cave," as it is called, have heretofore been unsuccessful. The explorer's detailed description of the strange and icy inner chambers of the cave will be awaited with great interest.

THAT France is now awakening to a keener sense of justice toward women in legal matters is evidenced by the repeated effort to have women form part of the jury when women prisoners are being tried. Obviously this is the

part of equity and reason. Few men are able fully to fathom the depths of woman's nature or understand the motives that may lie behind a woman's crime and the perverting influences brought to bear. We have our able woman lawyers to plead woman's cause, why not women jurors and even women judges to decide?

QUEEN VICTORIA of Spain has organized, it is stated, a series of informal musical evenings at the Royal Palace in Madrid, where etiquette is traditionally formal. Recently several of the artists from the Royal Theater—*El Teatro Real*—sang before the royal family, among other songs being several by Tosti, who was formerly the young Queen's music-teacher.

THE *Chicago Legal News*, now in its thirty-ninth volume, bears always the name "Myra Bradwell" in a prominent place, in loving tribute to Mrs. Myra Bradwell, one of America's pioneer women in the practice of law, who founded this journal nearly forty years ago and acted as its editor continuously for a quarter of a century thereafter. Although she has been dead many years, the joint editors, her husband Judge Bradwell, and her daughter who is also a lawyer, keep the loved name on its pages—a silent eulogy to the loved wife and mother, one who was recognized as a woman among women, her rounded character combining high intellectual attainments with the finest of womanly qualities.

## WASHINGTON'S OLD HOME AT MOUNT VERNON

### Thoughts at Mount Vernon

THE short month of February brings us the birthday anniversaries of two great Americans, Washington and Lincoln. Washington, hailed as *Pater Patriae*, the founder of the American Republic; Lincoln, held in the tender affection of the popular heart as "Father Abraham," the preserver and regenerator of American liberty. Very different were these two men in birth and training, but oh, so much alike in a glorious manhood superior to riches and to poverty; twin heroes in their devotion to the ideal of true Americanism. Their services to mankind extend far beyond their own country and people, placing them among the Great Ones of the World, while their virtues and achievements are an inspiration to the youth of all lands.

The visitor to Mount Vernon (named after a British Admiral, the friend of Lawrence Washington), whether he be an American or world traveler from a far country, receives an impression which is not likely ever to fade entirely from his memory. The stately, pillared mansion rising on the terraced bank of the rippling Potomac, behind the screening trees, is beautiful in its simple dignity. As we enter the low-ceiled rooms furnished much as they were when Washington lived there, with the ancient family portraits, the harpsichord which filled the place of the modern piano, the massive bed with its canopy of draperies, in which the General slept, his swords, the tall mahogany desk at which he worked over his accounts, and many other articles of great historic value because he used them, we think of him not so much as a great general on horseback commanding the army of a nation, but rather as the industrious and enterprising country gentleman,

devoted to the pursuit of agriculture and generously dispensing the hospitality for which the southern planters have always been distinguished, nearly all of the celebrated men conspicuous in the history of the country being his guests at one time or another.

Behind the mansion are the old-fashioned gardens enclosed by hedges of box 150 years old, and beyond, the rolling fields where were raised the great crops of tobacco which were loaded on vessels at the wharf where we land and carried to London or Bristol or Liverpool. In return these vessels brought the necessities for Washington's household purposes, the wearing apparel for himself and his family, and the implements needed for work on the plantation.

Mount Vernon always calls to mind also the figure of the gracious mistress of the establishment, the loyal and devoted Martha Washington. Here she reigned as a most industrious house-mother, looking well to the order and comfort of the home and carefully training her children and her grandchildren and also the servants on the large estate.

When to this quiet retreat, full of the peace and beauty of nature and the charm of dignified living the call came to Washington to take upon his shoulders the heavy responsibilities and duties of the Commander-in-Chief of the American army, Martha Washington showed herself the true wife, bade him farewell with words of courage and trust. Later on she cheerfully rode on a pillion behind General Washington to Valley Forge, and entered heartily into the work of alleviating the suffering of the soldiers. She was an example to the other women, of industry, economy, and courage. And when came the summons to the chair of the first

President of the Republic, this kindly little lady filled her place at her husband's side with an easy, simple dignity.

As we walk through the leafy aisles of Mount Vernon, or pass over the door-sills pressed by so many friends and helpers of humanity, we feel and we understand that these calls came to the master of this house not because of his wealth or his chivalry or his pleasing personal gifts, but because he had demonstrated that he loved his country and could be faithful to trusts in which he had no *personal interest*. And because he served his friends and neighbors and the colony of Virginia faithfully, justly and efficiently, he served well those larger interests which established the independence and glory and prosperity of America. And because he was loyal and unselfish, he turned his back on his tranquil home at Mount Vernon, the seat of his purest happiness, and went forth to toil, to suffer, to sacrifice almost everything but his principles on the altar of the higher ideal, asking no other reward than the success of the cause he served.

So the thoughts we bring away with us from Mount Vernon are these: That after all, the real test and proof of greatness lies not in military genius, in statesmanship, in worldly successes of fortune and friends, in valor, in perseverance, in self-control, neither separately or in conjunction; but in *single-heartedness and devotion*. The hero of the Revolution, as with every other great leader whose fame we honor and revere, was a man who had the capacity to lose self in the service of something greater, the faith and the will and the strength to surrender his personal interests to pure and loyal service for the general welfare, and by such means to advance the common cause. ## ABRAHAM LINCOLN

O H, slow to smite and swift to spare,  
Gentle and merciful and just!  
Who in the fear of God didst bear  
The sword of power—a nation's trust.

Pure was thy life; its bloody close  
Hath placed thee with the son's of light,  
Among the noble host of those  
Who perished in the cause of right.

—William Cullen Bryant

### Abraham Lincoln

ON February 12, 1809 Abraham Lincoln was born in a log cabin in the woods of Kentucky. In 1861, after nearly fifty years of toil, of self-denial, of disappointment, of patience, he was chosen President of the United States, the most honorable office in the gift of the American people.

A school-house was always to be found in every American pioneer settlement, a rude building built of logs with the light coming through the open door and the squares of greased paper which served as windows. The floors and benches were made of split logs called "puncheons," and there were no blackboards or slates or pencils, and usually only one text-book, *Webster's Elementary Spelling Book*. The teachers were not well educated and school was held but a few weeks in summer; so the boys and girls of those days had few opportunities compared with those we have today. But Abraham Lincoln was born with a hunger and thirst for knowledge and he used these meager weeks of school as stepping-stones in the great task of self-education which he had set himself.

When he was eight years old his father moved to Indiana. The settlement was larger and the school better, although Abraham had to walk five miles to get to it. There was a store also and the industrious lad was able to obtain a limited supply of paper and pencils; he learned to write, and had ink and copy books; he learned arithmetic and wrote the tables, rules and sums down on paper with much pains. He read every book he could get hold of in the neighborhood; there were not many: a *History of the United States*, *Life of Washington*, *Pilgrim's Progress*, *Aesop's Fables* and *Robinson Crusoe*. When he came to something in the books he liked he copied it down on boards if he had no paper, and kept it there until he did get paper. While the other boys of his acquaintance used their spare time in roaming the woods Abraham was devoted to his books and his sums and his penmanship; he did not have much leisure for these, however, as all day he worked for his father or as a hired hand for other pioneers, cutting down trees, clearing the land, ploughing, planting corn, gathering it and "shucking" it. But during the long winter evenings he read by the flickering light of the open fire and did sums on what nowadays would be thought a queer slate.

Iron fire-shovels were extremely rare among

Lomaland Photo. and Engraving Dept.

A CORNER OF A RAJA YOGA CLASS ROOM AT POINT LOMA

the pioneers; they used instead a broad, thin clapboard with one end narrowed to a handle. It was used when cooking to arrange piles of live coals on the hearth over which was set the "skillet" and "oven" and more live coals heaped on their lids. On such a wooden shovel Abraham Lincoln worked his sums by the firelight, using charcoal for a pencil. When the shovel was covered with figures he took a knife, shaved it off clean, and began again.

The hard manual work was really an advantage to Abraham for he soon became a tall, strong boy, and grew into a strong man, six feet and four inches in height. He was a leader in all athletic sports, the best storyteller among his companions and very popular with them, being full of fun and generous and helpful.

Many stories are told about Abraham Lincoln which show what a gentle merciful nature he had though he was so very big and strong. Once, when a boy, he saw a poor wood-turtle being tormented by some other boys who were trying to keep a burning coal on its back. Lincoln spoke very indignantly to them and forced them to give up their cruel sport. All through his life he had this tender feeling for animals and often protected them and would even carry them in his arms into a safe place. He showed the same compassion to a miserable old Indian who wandered into his camp when he was captain of a volunteer company in the Black Hawk War. His companions would have shot down the old man had it not been for Lincoln, who protected him.

For a while Abraham Lincoln worked on a ferry boat that carried passengers across the

Ohio River. Once, in a flat boat he sailed down the Mississippi River to New Orleans. This was his first trip far from home. When Lincoln was twenty-one, according to the custom on the frontier, he left his father's house to make his own fortune in the world. He had kept on steadily with his studies, learning wherever and however he might. He now made many efforts to get on in business but was not always successful. A partner of his proved dishonest, and all the debts fell on Lincoln. He could not pay them then, but a few years afterwards he paid off every cent and gained the reputation for honesty that he always kept.

Later on when Lincoln was a lawyer—he had to borrow the books and teach himself how to be one—he would not use his knowledge of the law to defend anyone he believed to be guilty; and he would never help people to claim anything unfairly. He always tried to be on the side of Right. People came to have a deep trust in a man who worked honestly and unselfishly and would not use his talents for any purpose he believed wrong; and though Lincoln had many difficulties, year by year he became more useful to his country and more famous, until he was chosen to go to the National Congress at Washington, and then at last to be President.

Like many other noble characters he had enemies. But he was always just and generous. He was a teacher, too, in his own kindly way. He tried to teach people to see their follies and to learn to know themselves, by telling stories into which he put his own wisdom. Work and love made Lincoln great and enabled him to serve so nobly. # THE MYSTERIES OF THE HEART DOCTRINE

Prepared by  
**KATHERINE TINGLEY**  
AND HER PUPILS

## *The Theosophical book of the Twentieth century*

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1.25 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

Order now from

### The Awakening of the Lay Intelligence

MANY, even of our greatest authorities, seem to think there is still likely to be discovered in the future a good deal about the universe which we have not discovered yet. But most people who indulge in prophecies assume that the new discoveries will be along the same lines as the old, that there will be a still greater expansion of physical science, that chemists will discover more chemistry, biologists more biology, and so on.

It seems probable however, that if we turned to history, we might discover quite a number of instances in which this advance in knowledge came rather in the form of a revolution, and upset the existing authorities instead of emanating from them. Indeed, is it not the rule that advances in knowledge have sprung up from within the lay mass of the people and have had to encounter strenuous opposition from the authorities?

What then, if the people should suddenly wake up, as it were, to a new sense of power and intelligence and turn away from their blind following of the leaders of thought of various kinds? Would it be so very surprising?

### An End of Talking Images

Suppose the people were to decide that it is useless any longer to accept celebrated physicists as authorities on religion, morals, politics, education, belief, conduct, time, eternity, and things in general; or to acknowledge biologists as sages on the subject of Man's nature and destiny; or writers of quasi-scientific romances as specially illuminated with regard to the way in which the universe should be run; or, in fine, *prime donne* as authorities on soap.

And suppose the people should decide that all these various authorities are not specially qualified *outside* their respective spheres, and should make up their minds to do a little independent thinking of their own.

It is not impossible, it is more than probable, that the next new awakening to greater knowledge will come in this way. The people have the facts of life before them and the faculties with which to judge them. And while a large proportion of the multitude may be unthinking and approximate more or less closely to Carlyle's celebrated definition of "mostly fools," this is by no means the case with a numerous intelligent reflecting portion. These latter may not be specially trained to think along certain lines regarded as indicating culture and capacity; but it is, from our pre-

### Humanity the Thinker

sent point of view, quite an open question whether such special training counts for or against them in an estimate of relative intelligence and capacity. We have seen that special scientific training is apt to qualify the intellectual faculties disadvantageously by giving a narrow view-point on other matters, and the same is true of other special cultures such as the theological for instance.

Just as the theological idea colored, cramped and warped medieval thought, art, and culture; so the Nineteenth century "scientific" idea has warped modern thought along many other lines, until we have a veritable system of bigotry and superstition by which we seem hypnotized. The "primitive man" notion keeps before our eyes the picture of savages killing each other with their stone axes and worshipping thunderstorms; until, unlike all the savages of experience, they "strained upwards" and gradually evolved art after art until they reached the present admirable stage of creditability. The animated world has ceased to be the manifestation of Universal Mind and Will and has become a wonderful but futile mechanism.

Reading current literature we see on all sides the dawning of a tendency to strike out fresh lines of thought. And also we see the bigwigs, who have been accustomed to regard themselves as leaders of opinion, endeavoring to keep themselves abreast of the tide by getting their names associated with "movements" and formulations of the new ideas under catchword titles.

Eminent divines have rushed out to offer themselves as leaders of the too adventurous public opinion, lest the public should leave its prophets and standard bearers in the rear. Eminent scientists have come out of their holes and hurried to formulate scientific "catechisms," thus authorizing the results of advance thought and affixing the official scientific seal; so that now we know what it is legitimate to believe. Everywhere we see the same rush of "leaders" to the front from the rear where they were being left.

It is awful to see the attempts now being made by religious authorities to keep up with the rush of thought without dropping their voluminous baggage, and to cram the whole of modern speculation into the compass of their creeds. It is ludicrous to see how professors of every kind are endeavoring to identify their names with some new formula that shall collect a following of advanced thinkers

### Horrified Neglected Prophets

It is awful to see the attempts now being made by religious authorities to keep up with the rush of thought without dropping their voluminous baggage, and to cram the whole of modern speculation into the compass of their creeds. It is ludicrous to see how professors of every kind are endeavoring to identify their names with some new formula that shall collect a following of advanced thinkers

It is awful to see the attempts now being made by religious authorities to keep up with the rush of thought without dropping their voluminous baggage, and to cram the whole of modern speculation into the compass of their creeds. It is ludicrous to see how professors of every kind are endeavoring to identify their names with some new formula that shall collect a following of advanced thinkers

under their banner, and respectful admirers.

The fact that Man, as such, contains within himself the source of knowledge and power, is again forcing itself upon the general consciousness. People find that neither theologians nor scientists possess

**"A Plague on  
Both Your  
Houses"**

the keys of Knowledge, nor can help them to find their own higher nature. Theologians and scientists are alike

helpless and at variance among themselves. The pressing social problems of the day are insoluble for them. Some of them say that it is outside of their proper sphere.

We have seen in many lands the authority of public conscience and innate perception of right and wrong set up against the authority of churches; and thus is asserted the existence of an authority superior to that of the established courts.

Science often finds it convenient to strictly define its sphere, in order to avoid the difficulty of passing judgment on questions outside of that sphere; but it is also fain to make people believe that there is no other sphere outside its own. This, however, is a point on which people may hold a different opinion.

Science is limited to the information to be gained from the physical senses, aided by mechanical instruments: and

**Self-Limited  
Autocratic  
"Science"**

it also goes beyond the range of actual physical perception into an imaginary world wherein the notions derived

from sense-perception are ideally extended. But of the possibility of higher modes of perception than those of the physical senses it takes no account.

Everything points to the conclusion that the customary leaders of thought, religious, scientific, or what not, are now struggling in the rear, being dragged along in the wake of advancing thought. There is being evolved a public sense of right and wrong and truth that will yield to no authority. After all, so far as mankind is concerned, human nature itself is the greatest fact in the universe; and, as in the course of evolution, new faculties unfold and new energies stir in the human breast, light and strength come from that source. Mankind is awakening to a consciousness of the larger life within itself. Men feel painfully that the present standards of life are below what they feel to be possible for humanity, and they realize

**The Greater  
Calling  
of Man**

the fatuity and finity of many of our aims.

What is Man? What is Life? we ask ourselves. And

we feel that the answer to these questions must come through self-knowledge and that self-knowledge comes through self-discipline. Behind the many impetuous wayward faculties that absorb all our attention and energies there lies a deep still calm, the center of balance and control. If we could reach this, we should find knowledge and power and peace. We must study our own nature and learn how to make all its wondrous faculties obedient to that infinite Will that is within us.

And this science of Self-Knowledge is the ancient "Secret Doctrine" or Rāja Yoga, the key to all mysteries, the source of all religions. It cannot be learned from the churches or

from the scientists. Its pass-word is Unity; we have to get beyond the self-motive in life and learn to live for a broader ideal. For selfishness is the source of Man's weakness and ignorance; he cannot win power and wisdom until he has learned to withstand that attractive and repulsive force of personal desire that now drags him hither and thither in the

**Self-Knowledge  
the End**

currents of fate. He must strive to realize that while his life as a separate personality is infinitely small and unimportant, there is awaiting him a life that is infinitely great—his life as a Man, as a partaker in the life of all that lives.

By ever striving to run our life off from the lines of personal interest and to identify it more and more with the great cause of humanity, we shall evoke and develop within us the consciousness of a larger life—the Soul-Life, which will supersede the feverish muddled brain-life. In this larger Life will dawn serenity and knowledge.

Man will give up regarding himself as the creature of a few brief years and fixing his hopes on a future heaven, and will come to see that he lives in a present which ceases never, and that Life consists in using all his powers and faculties to the very best wherever he may be. With the awakening of the Soul-Life the consciousness of immortality will become clearer and the fear of death fade away.

STUDENT

### The Passing of "Modern" Science the Resurrection of Archaic

DISTANCE in time, like distance in space, is seen in false perspective; near objects and events seem great beyond their due proportion as compared with the distant scenes whose ample stretches are crowded into the bird's eye view.

The above is a proverbial commonplace; yet how often we fail to apply it. Nowhere do we fail worse than in estimating our own times in comparison with the past.

The ancients had no science, we are told. But what if science has modes or fashions of study which are, after all, nothing more than episodes, temporary fashions? There is much to suggest this view: the science of some years ago is not so popular with educationalists as it was; the expressions of scientific opinion are not taken very seriously by the public.

The ancients always had enough knowledge of science for practical purposes; many of their technical secrets have not yet been rediscovered. Apart from such technical uses, what does science amount to? In the matter of hygiene alone, for instance, it still seems not to have made up its mind, and to have a habit of suddenly subverting its own positive assertions.

All indications point to the belief that the world is tending rapidly towards an absorbing interest in serious questions which science does not yet touch; and that consequently present-day "science" will play a part of ever-diminishing importance as the years roll, and may be eventually swallowed up in history as merely a temporary phenomenon—unless it changes some of its fundamental bases, which, in fact, it is fast doing.

All lovers of freedom and the independence of the human will must welcome a resurrection from dogmatic belief to free inquiry into the mysteries of life. But such an inquiry must not halt at a landing stage and become a new dogmatism. It must pass on; and we need a Science which shall teach us the mysteries of the life we have to lead, and that shall not merely take us into by-paths of curious inquiry.

STUDENT

### The Development of Drawing

AN English paper gives the following account of a professor's views:

Contrary to a popular impression, it is not in profile but with a full face that the child at first draws a man. In the drawings of children at the age of four, the feet, the eyes, the face, and the arms, appear as seen frontwards in four-fifths of the specimens examined. But in the drawing of children who have reached the age of nine the profile view of a man appears in two-thirds of the specimens. There is a transition period, during which the front view appears blended. Children at about the age of seven are particularly prone to this artistic anomaly. Perspective is the greatest difficulty of the child mind. . . . The similarity of children's drawings to those of primitive savages is astounding, for the adult savage never seems to have outgrown the primitive type of child art. He makes his man frontwards. He inserts the full eye in the profile. He has his man larger than any hut in the landscape. But there are similar examples from antique art. Egyptian art of the Hyskos period shows the profile constantly with the frontal eye; and there are other blunders exactly similar to these to which childhood, whether it is the child of Paris or the child of Tibet (whose drawings are indistinguishable) is prone. Similarly there is little difference between modern child art, Etrurian art, and the modern Maori art; the mysterious cities in Yucatan had artists on a level with our nine-year-old children; and the ancient Greeks seem to have advanced to our ten-year-old child's knowledge of perspective. A stumbling block from China to Peru in ancient art, as with children, has been the putting in of a shadow.

The only truth about these facts, so far as they are facts, is that certain peoples, whether ancient or modern, make or made, the same "mistakes" in drawing.

But what an onslaught on ancient art! The whole of past history has to be misrepresented by adducing all the cases which support the theory and leaving out all those which contradict it. (Other newspaper articles are daily describing the wonders of ancient art discovered by the archaeologists, and comparing them with the best productions of modern times, often to the detriment of the latter. Even the ancient Greeks are sacrificed by this professor with a theory. We thought we had heard some stories about Zeuxis and Parrhasios—but perhaps we are mistaken. If we have not any Greek paintings to inspect, it is reasonable to infer that a people who were unequalled artists in all the less perishable forms knew more about drawing and painting than a child or a savage.

Again our professor does not seem to recognize that much of the technique of drawing is convention, and that other people have had different conventions, and that as regards ancient races, such as the Egyptians, Tyrrhenians, etc., their art was *religious*—hence strongly conventional to certain accepted canons connected with symbolism. STUDENT

# Some Views on XXth Century Problems

## Astral Echoes

MR. W. T. ELLIS, who has made a great tour of inspection of various missionary centers and reported some quasi-Pentecostal phenomena as occurring among Hindû girls, appears to have aroused some scepticism in religious circles. Voicing this, a Presbyterian journal expresses some doubts as to whether the genuine thing has happened since the times described in the Acts.

Why not? Given the conditions—great excitement, intense expectancy, a sufficient sprinkling of very emotional women and men, and the quality of the occasion—and the phenomena will repeat themselves. That is to say, among numbers of the more emotional and susceptible, a semi-hypnotic, semi-epileptic, mediumistic condition will supervene and spread to others by infection. The mind becomes almost an automaton and repeats anything apropos in the depths of memory, sometimes in the memory of bystanders, as well as some of those astral echoes of old speech that are always faintly about us. It will exercise a sort of selection among these, fit them into some half-coherence, and thus even produce orations of no very mean order. But the whole process is strictly of the nature of delirium. The "Holy Ghost" does not use people's lips to speak in languages they do not understand. It illumines minds with truth, not hypnotizes them. And rapt silence, not excited loquacity, is the condition of its advent.

Here is Mr. Ellis' account of the Hindû girls:

These girls were pleading for a visitation of the Spirit of God for India—the Spirit of God had come to them and endued them with the spirit of intercessory prayer, and some of these girls who did not understand English were praying in English; some of the girls who did not understand Greek were praying in Greek; some of them were praying in Hebrew; some of them were praying in tongues that no man can interpret.

Why did "the Spirit of God" find it necessary to come and inspire all that polyglottic delirium before it could do what one must presume it wants to do anyhow, namely, help India?

The Presbyterian critic is right in his scepticism of the sanctity of the phenomena, but why does he not extend it also to the Acts occasion? However, we know that to believe that miracles happened two thousand years ago is piety: to believe that any have happened since is superstition. The scepticism appears to rest on that principle. STUDENT

## Divine Impenitence

THE "gift of tongues," tried in the marketplace, turns out to be false coin.

A well-known emissary of the Bible Missionary Society writes from Macao, China, reporting concerning "four different groups of workers who have come out thinking that their gift of tongues was a language with which they could speak to the people." These groups went variously to China, Japan, and India, and met with the same experience.

They could no more preach to the people among whom they went "than other missionaries who never heard of the power to speak in tongues." They could not say a comprehensible word. He says, somewhat mixing his metaphors:

This is quite a different condition of affairs to that which they expected, and in the sudden reversal of their expectations they are aface with a new situation, and one that many are not prepared for, viz., to buckle down to hard study, like other missionaries have done, and acquire by long and hard work the language. This knocks the wind out of their sails, and at one blow a large part of the glow surrounding their supposed call to the heathen is gone. Unless they have "grit as well as grace," and a goodly supply of both, they are likely to settle down to a life of revulsion to all the supernatural in religion, or to idleness, or, worse still, drift into sin.

From the very nature of the case, the prognostications in the missionary's last sentence are more than likely to be realized. The meetings at which the "gift of tongues" and similar phenomena are developed, are orgies of psychic intoxication, as poisonous to the moral nature as alcoholic intoxication is to the physical. Children, moreover, are introduced to every one of them by scores, swept up in the whirl, and morally and mentally damaged for life. One mother writes to this same missionary telling him that her little daughter has "the gift," can speak in a dozen or more tongues, and feels the call to go to China!

The meetings are but extreme forms of the ordinary revival services, and these again but extreme forms of the ordinary "calls to the impenitent"—that is to say, evocations of emotion beginning with fear, deepening that to the point of abject cringe, and leading it on finally to the equally abject relief and comfort in the surety of having been "rescued." "I mean," says a well-known writer, in *The Presbyterian*, "that the preacher should hold up the ugliness and the doom of sin before the sinner's eye so that he should feel his own guiltiness, and so present Jesus Christ that that sinner should flee to him as his only Savior."

In other words he should raise a psycho-emotional storm and then still it. He has produced the hypnotic state, paralysed the will, wiped out all sense of human dignity from his subjects, and then made the "suggestion" that the doom awaiting them at the hands of their creator has been averted by the death of somebody else. That is the revival-service program.

All such séances are outrages on poor human nature, which has lost the consciousness of its own divinity. True religion is precisely in and of that consciousness, and the true teacher of men will try solely to rescue it. If he does not, if he plays on fear and compels self-abasement, if he does not awaken this knowledge of inherent divinity,—he stands self-proclaimed as being himself without it. He is labeled by the very fact of his use of the Revivalist methods. In nine cases out of ten the hearer is "impenitent" merely

because, though he has never been taught of his divinity nor how to use it, he has sense enough of it to refuse to hear it denied or slighted. His "impenitence" is intuitive and even almost divine self-respect sounding its note through all his follies and weakness.

STUDENT

## The Maison Paternelle

MIGHT the French *Maison Paternelle* be imitated in English-speaking countries? It is a Reformatory with the incredible peculiarity that it reforms. Another peculiarity is that it is for the sons of the wealthy.

A parent whose son seems incurably vicious or idle goes through some small legal formalities, and the youth disappears from society.

On his entry into the beautiful and beautifully situated building he is assigned a cell not beautiful unless voidness is a beauty. He sees no one but an attendant, and his door has a glass panel looking upon—or rather looked upon by—the attendant's corridor.

The French believe in the alchemical power of thought, and the youth now proceeds to think, perhaps for the first time in his life. He thinks because there is only one other thing to do, namely, to rage. That he soon finds profitless. It is explained to him by the attendant that if he finds time going laggardly he has only to express a desire to study and work, and that there are professors at hand only too eager to aid and teach him.

And there are. Whatever he wishes to study he may study. As soon as he does so wish he is provided with a much more comfortable cell, still, however, with its window in the door; with a professor and with books. But throughout his stay he sees no other living soul than the attendant and the teacher or teachers. He naturally studies intently, by reason of there being nothing else to do. And equally naturally, he comes to like his studies.

In between whiles he thinks, and in nearly every case, it is reported, his character undergoes a profound change for the better. During his residence he has no name, only a number. And after his release all papers relating to his case are destroyed. No inmate knows any other; no outsider need know of any inmate. Therefore he returns home entirely undisgraced. But he knows, of course, that the parental authority that put him there once may do so again.

It is difficult to say how the system would work in English-speaking countries. The French mind, French feeling, is *sui generis*. The whole nation, as a unit, has much more of the family spirit than we. And this wraps round every member of it in a subtle and peculiar way. The Ishmael is much less radically an Ishmael than with us, whatever the external similarity, and is much more readily reclaimed. Could we conceive of ourselves as relying confidently and naively on solitary contemplation as a youth's character-builder? Yet that people does rely on it—and on the study of science!—and their plan *works*! The prodigal comes back! STUDENT

## "La Vache de Deir-el-Bahari"

**M.** EDOUARD NAVILLE, the Egyptologist, has been writing in the *Gazette des Beaux Arts* on a beautiful group of statuary which he discovered at Deir-el-Bahari in February 1906. M. Maspero says: "Neither Greece nor Rome has left to us, nor have we ourselves, anything which compares with it," and the illustrations accompanying the article go to prove this judgment not exaggerated.

The group represents King Amenhetep II with the goddess Hathor. It is life-size, and carved in stone and painted a red-brown with details in black. The cow-goddess stands erect, as if emerging from the water, long masses of moist papyrus grass hang like a parted veil from her horns, which enclose the lunar disc; beneath her head stands the king. The group is marked by a grandeur of conception, combined with absolute truth to life, which can only be called astonishing. How was the unnamed sculptor able to put so much of the majesty of the universe into the figure of a cow?

The answer is to be found in the true meaning of the science of symbology. All natural objects were to the Egyptians symbols of universal truths, words, we may say, in the language of God. The form of the cow was used as implying a whole great principle in nature, something august, maternal, beautiful.

The statue is perhaps destined to become as well known as the cow of Myron, so famed in the Greek anthologies. Perhaps, indeed, Myron drew some of his inspiration from this marvelous work.

And the name of the sculptor is unknown. So he can never be converted into a solar myth, and never be accused of not having been himself at all, but "someone else of the same name"! STUDENT

## Ophir and Solomon

**D**R. KARL PETERS at a public meeting in Berlin told his audience how he had discovered in the southeast of Africa, between the Zambesi and Limpopo Rivers, "many shafts of ancient gold mines, 500 temples, fortifications, and other ruins of Phoenician origin." Consequently he is convinced that this region was the Ophir mentioned in the Bible as the place whence King Solomon procured his gold. He thinks also that the coins recently unearthed in Mashonaland belong to the time of King Solomon.

The Bible says:

King Solomon made a navy of ships. . . . And Hiram sent in the navy his servants, shipmen that had knowledge of the sea, with the servants of Solomon. And they came to Ophir, and fetched from thence gold, four hundred and twenty talents, and brought it to King Solomon.

And the navy also of Hiram, that brought gold from Ophir, brought in from Ophir great plenty of almu trees and precious stones.

## A CORNER OF THE OLD ROMAN FORUM

SHOWING the remains of the Temple of Saturn: eight out of ten original granite columns, believed to belong to the latest rebuilding, in the reign of Diocletian. Tradition says there was a prehistoric altar to Saturn; and on the site of this a Temple of Saturn was built about 500 B.C. according to the records. It was rebuilt in the time of Augustus, and the travertine sub-structure of the columns still exists. The Colosseum is seen in the background on the right.

Jehoshaphat made ships of Tarshish to go to Ophir for gold.

Then shalt thou lay up gold as dust, and the gold of Ophir as the stones of the brooks. (Book of Job.)

It is also mentioned in the Psalms and in Isaiah. In Genesis x, 29, Ophir is mentioned as the name of one of the descendants of Shem, which has led some Bible students to think that Ophir was in Arabia. Others have identified it with Sofala on the east coast of Africa, and others with India.

History shows unmistakably that there were natural riches obtainable from somewhere south of the Red Sea, or in Africa beyond the deserts of the north. As to the Ophir of the Bible and Solomon, it is not easy to say just what we are speaking of when we refer to topography, as we do not know what age is referred to. Africa, as a continent, emerged from the sea later than most of Asia, but earlier than Europe; and later again there was a time when the Saharan part of Africa was again temporarily submerged. Hence it may be impossible to fix such sites by modern landmarks.

We learn from *The Secret Doctrine* that "Moses," an Initiate into the Egyptian Mystagogy, based the religious mysteries of the new nation which he created, upon mathematical formulæ derived from the Egyptian Initiates and used in the construction of the Pyramids. These data are symbolized in the measurements of the Tabernacle which he is

supposed to have built in the wilderness; and on them the later Jewish High Priests constructed the allegory of Solomon's Temple—a building which never had a real existence, any more than had King Solomon himself. The Persian traditions speak of a race of wise kings of the East called Sulimans, and count seventy-two of that name. Thence King Solomon, whose traces are nowhere to be found outside of the Bible, and the descriptions of whose magnificent palace and city dovetail with those of the Persian tales, though they were unknown to all pagan travelers, even to Herodotus. STUDENT

## Carnivorous Dinosaur

**T**HE American Museum of Natural History has mounted the skeleton of an Allosaurus, a huge carnivorous dinosaur. In the mount it is represented as feeding on the vertebrae of a Brontosaurus. The Brontosaurus was larger than the Allosaurus, herbivorous, bulky, slow-moving, seventy or eighty feet long, and without armor or apparent means of defence.

Carnivorous dinosaurs are rare. This was found in the Como Bluffs, Wyoming. It is 34 feet long, like a gigantic lizard, standing on its hind legs, and with teeth like an alligator. The hind limbs are eight feet long, massive, and with great claws, used probably for tearing the flesh off its prey. The tail is 20 feet long, and the animal stood some 20 feet high. T.

## Conscious Electricity

**E**LECTRICIANS who are philosophically-minded will be very shortly raising the question of the consciousness of electricity and its relation to will.

The point comes up in connexion with the use of the galvanometer to detect crime. The galvanometer is a magnetic compass with a coil of wire wound around it. When an electric current is sent through the wire the needle deflects to the right or left, and the amount of its deflection is the measure of the current.

The human body offers a certain resistance to the passage of a current. If the poles of a battery are connected with the palms of the two hands the intensity of the flow must be raised to a certain point before this resistance is broken down. A galvanometer put into the circuit shows that the resistance varies with different people, with the same person in different states of health and different times of the day, and with different qualities and degrees of feeling. As one emotion deepens or gives place to another the resistance rises or falls.

It is proposed to use this fact in the detection of crime. Words or objects connected with the crime are said or shown to the supposed criminal, and his altering emotions, fear, remorse, and so on, are indicated by the needle of the galvanometer.

The plan may or may not be practicable; the point here is the relation between electricity and feeling. That there is a relation between emotion and intellectual activity, and electricity, has been known for some time. Here is a new step in the direction of definiteness. Is feeling the subjective side of electricity? If so, has all electricity a subjective or conscious side? Such questions have already been asked in connexion with this almost new fact.

Theosophy teaches that wherever there is a chemical, magnetic, or electric change in nature, there is a change (small or larger) in her consciousness at that point. For the purposes of thought and language we make a duality where there is really none. So we have to say that in man, feeling and electricity are the measures of each other. In him they are under the control of will and we can say that this acts upon electricity or magnetism through its subjective side. But between will and such magnetic and electric changes as science can now measure, there are subtle grades of the same force not yet known to it which translate themselves down into those which are known. And so in nature.

If a man does not use his will he is the prey of his feeling or emotion; and without losing sight of the real facts there would be no harm in saying of such a man that he is therefore the prey of those magnetic and electric changes which he should control. He is then nothing but nature; and nature, where she should be controlled but is not, becomes *lower* nature. Man cannot make "nature" his excuse. She has lent him some of her force and demands of him that he control it and harmonize it.

But all these instrumental methods of detecting crime, apart from their interest as scientific curiosities, are open to most serious objection. *They will "detect" crime that was never committed at all.* If their ingenious inventor succeeds in getting their results into the law-courts, as he wishes, the innocent man may possibly go to jail or the executioner's chair ten times where now he goes once.

An innocent man's fear of being *thought* guilty will give exactly the same instrumental results as a guilty man's fear of being *found* guilty. In certain very negative or timid natures an ordinary examination by a stern and positive inquisitor with a preconception at the back of his mind may even produce a semi-hypnotic state in which the victim's mind may be reduced to a mirror of the examiner's, or in which every question acts as a suggestion evoking in an extreme case elaborate "confessions" of acts never committed; and in slighter cases the manner and appearance of guilt. An instrumental examination would register this appearance and concrete it into "evidence."

STUDENT

## "Exhausted" Soils

**F**URTHER investigation is confirming the view that what is called the exhaustion of soils is no real exhaustion at all, or may not be; but is due to the accumulation of toxic products secreted by the vegetation. These are very elusive to chemical investigation, though very definite in their effects.

If, for example, wheat is grown so repeatedly in the same soil that the yield becomes very small, it is found that a watery extract of this—so-called exhausted, but really only poisoned—soil, added to fresh soil, will make a first crop of wheat sown therein as poor as if it were the last crop of a long series. Turn up that "exhausted" soil to the air and leave it two or three years; it will be found to have recovered itself in a way that has until now been inexplicable. The explanation is that the sun and rain and air have oxidised and destroyed the poisons.

In the case of Cowpea the toxin has been isolated. This plant was grown repeatedly in the same soil until the yield was very poor. An extract of this soil was found to contain a crystalline principle which was poisonous to the plant itself *but beneficial to wheat*.

Here is a secret of agriculture, by no means fully worked out as yet. The problem is to find what plants thrive best on the toxins of what others and use them up. Gradually a perfect system of rotation will be worked out. And, combining this knowledge with the cultivation of any number of new species of nitrogen-fixing bacteria, so as to have perhaps one for each food-plant, we may find ourselves able to dispense altogether with manures and chemical fertilizers. Food will cheapen in ratio of the cheapened production and enhanced yield.

We have lit upon several other possibilities of food cheapening and bettering during the last few years. Burbank and others have

shown the power in our hands for the production of new and permanent species by crossings; species that shall have all the qualities we want and no others; that shall bloom when we will; that shall have what proportions of nitrogen and starch and sugar we will; that shall be adapted to what climate, what cold, what aridity, what rainfall, what soil, we will; and that shall resist parasites and diseases and birds. It is hardly too much to say that each country will be able to adopt into itself whatever habitant of any other country it may wish and give it all desirable qualities.

In this sort of work man shows himself as a part of the intelligence of nature or a co-worker with her. And in that co-partnership she shows herself able to support human life in any degree of density. If there are any difficulties, they lie with man himself, his selfishness, wantonness and quarrels. STUDENT

## Ancient Concepts in Chemistry

**S**OME of the ancient concepts in chemistry are coming back very nicely. It almost looks, in fact, as if chemistry might one day be studied as one of the branches of archaeology! Since, very far back in our own civilization, they had some very modern notions of the behavior and constitution of things, it seems possible that very much farther back yet, before history begins to touch the canvas, they might have had notions to which it will take us another century or so to attain.

We have had the atoms, Lucretian and pre-Lucretian, for a long time. But why do they combine and separate? Some of the ancient atomists said, because of "love" and "hate"—thus endowing them with conscious feeling. Others dropped the terms indicating consciousness and substituted *affinity* and *repulsion*. In our own time these terms have been duly laughed at—now to be re-adopted. To say that atoms combined because of affinity, was to explain nothing, was to say the same thing twice, was to explain that clocks keep time because of their "horology."

So the word affinity was kept out of hearing, and the chemists spoke of "bonds," each atom being credited with from one to five or six of these. This was of course still affinity under an alias, but detailed into *how much* affinity. And it enabled the affinity to be made into a picture.

A noted German chemist now returns to the very word. From certain facts, says *Science*:

Werner draws the conclusion that we must drop our idea of independent, definitely directed valencies [another word for bonds]. In place of this conception he introduces that of "affinity"—an attractive force acting, in the manner of an electrical charge on a sphere, from the center of the atom and uniformly distributed on its surface.

Having got back that far, the next step backwards, absolutely unavoidable in the long run, will be to re-credit the atoms with sentience and make that the real cause of their behavior, their unions and partings. STUDENT

## The Sacred Isle

Itsukushima, Japan, December 1907.

LIKE a dream of wondrous beauty, Itsukushima rises out of the clear blue waters of the Japanese Inland Sea. Cone upon cone it towers, hill upon hill; and the fir tree climbs them all. Firs a hundred years old strike their clinging roots into the earth on the crests, making bold outlines against the bright sky. In the valleys the deep solemnity of the firs is broken by the smiling verdure of leafy woods, and now in the fall the maples flame red as blood.

Many warm summer days have I wandered in these woods and trod the lonely path that winds its way up amid mighty trees—giants, many of them gray with age and tottering to their fall, others blasted in the flower of their might by heaven's fires. On one side of the way the hill rises in a gentle slope covered with blooming brush and luxuriant ferns; on the other is a yawning chasm in whose depths, among massive boulders, there foams in crystal waves the "Cascades of the White Thread." Here all is coolness and silence; the waters purl in the ravine, but no other sound is heard. This is the spot where he should go who longs to hear the inner voice. This is the "Sacred Island."

Thus it has been as far back as the annals of Japan can tell—long before Kobo Daishi, "The Great Teacher" who brought the Law from a foreign land, 1100 years ago lighted on the highest peak a temple-fire that has never gone out. Many of the mighty Mikados, Shoguns, and Daimyos have cared

for this spot; and hither came the grim war-chiefs of Japan, their swords left behind, to worship the Gods. In those days the island was consecrated to peace and purity; and so it is even today. No plough may touch its virgin soil; and, as far as may be, death and pain are banished. When children are born, the women are carried across the narrow passage to the mainland; they who are about to die must likewise cross the water. Even if they should meet their death on the sacred ground, they cannot find their resting-place there; and the opposite shore is covered with memorial stones to the dead from Itsukushima.

No jinrikishas or other vehicles, no stray dogs, may disturb the peace of these lonely woodland ways. Everywhere in this home of Nature reigns the law, "Thou shalt not kill!" Here man is no enemy to other living beings; the stags and deer in the spacious temple-parks have no fear of man; they come forth from the dark forest to join him in his walks and feed from his hands. Even the pigeons show no trace of shyness as they circle in hundreds around the wanderer's head or alight at his feet; the goldfish in the temple-ponds have naught to fear.

But the *tabu* does not reach the life in the sea glittering yonder in the sun. Where I wander on the white sand of the shore I can see fleets of fishing-boats plying on the waters; it is the people of the Sacred Island, who earn from the depths that which they need for their simple fare. Others have tea-houses and lodgings for the pilgrims who come every year; others again are merchants in the little village, and the number is made up by the priests of the temple.

From time immemorial the temple has been sacred to the divinities of the sea, and the sea-waves plash around its foundation pillars. Far away in the

water, even at low tide, stands the great torii, the principal gate; and from it a long avenue of stone lanterns leads to the sacred spot and beyond it along the roads on the shore. Far within, amid the mystic gloom of the wood-paths, they may be found, in company with some grim old stone lion guarding the way to a shrine.

When high tide comes in the evening, the temple of Itsukushima becomes an island floating on the water. Its vast red colonnades, the work of the tyrant Kiyomori of the mighty family of Taira, become bridges between lakes of clear still water. Later on in the twilight, the two hundred and sixteen bronze candelabra along parapets of the colonnades begin to flame with a red and flickering light, whose reflections dance on the water-mirror and sparkle among the tree trunks; then indeed the picture becomes unreal, fairy-like. The hurrying life of today, with all its toil for material ends, is so near and yet so far. Only a few hours from here it runs its never-ending course in great seaports and factory towns where all the needs of our age of luxury are made or exchanged. And here one finds oneself set back to an age when life floated on quiet waters, just like all those little boats to-night on the tranquil Inland Sea. Here temple candelabra burn among green trees, and from their shadows the deer come forth to the path to view the wondrous scenery of the night. Here the men and women of the island go about in many colored robes, along the paths by the shore, to fill the mind after the day's work with a melody which both Nature and tradition join in instilling. It is like a dream which one expects to disappear at any moment.

This is the first time I have seen Japan as my fancy, inspired by many a harmonious picture, had painted it.

Path

### Reincarnation

ONE of the fundamental teachings of Theosophy is the law of Reincarnation, or rebirth into earth-life in a human body, again and again until material life has been mastered.

The law of Reincarnation has sometimes been called the "Lost Chord of Christianity," for it is known to have been taught and believed by the early Christians, and it is in the faith of millions of people in the world today.

Man is a divine living Soul, not merely the body which we can see. The body is but the tenement which the Soul inhabits—the instrument through which it works, and it is through the body that the Soul learns to realize itself, just as the instrument of the musician is the means by which he learns to express outwardly his highest nature.

We do not know all the possibilities of the body, because we have not yet perfected the body. The Soul cannot perfectly express itself until it has a perfect instrument. It is possible for the body to become in perfect harmony with the Soul, and the Soul must reincarnate until this unity is brought about. The Soul becomes so entangled with the body and its gross material nature that it almost loses sight of its own nature, and so it has periodically to lay aside the body and rest, entering into that state which we call "death." Here the Soul is untouched by earth-life; no word or thought can disturb its peace. The only line of communication is the pure current of love from those on earth, who have been left behind. This reaches the Soul and enhances its dream.

But after the rest is over it is drawn back to the earth, to resume its work; to take up again the uncompleted tasks; to resume old ties, and make new ones.

One of the reasons why we do not remember our past lives is that with the new body comes a new brain, but although we do not remember in detail past experiences, these lessons and experiences have been registered on the Soul, and are shown in the character, and as this past knowledge accumulates with each life, the Soul will ultimately have a body through which it will be able to find perfect expression. Then consciousness will be continuous, and whether entering or leaving the body, it will remain unbroken.

Without the truth of Reincarnation how do we account for the very obvious fact that children come into the world with characters all formed, with characteristics and tendencies that could not possibly have been acquired since birth? How do we account for the high and low positions in life; for the geniuses along all lines, in music, literature and art? Take for example the child Mozart. How can we account for the wonderful knowledge which he manifested so early in life—in his babyhood almost. Can these things be attributed to heredity, especially when parents often show none of the characteristics seen in their children?

If we believe in the immortality of the Higher Self, that it is deathless and has no ending, must we not also believe that it is without a beginning? Hence what we call genius must be the result of the accumulation of past knowledge. This seems much more reasonable and easy to believe than that a just God would create a world of beings so unfairly portioned, many with marked ability, but with no opportunity to express it; others with plenty of

opportunity, but no ability to use it; rare and beautiful Souls forced (seemingly) into situations in life where their surroundings are sordid and utterly distasteful, nothing which finds any response in their natures; yet they have to struggle on, unsatisfied, and longing for better and higher things.

On the other hand, we may look around us and see those in the so-called high walks of life surrounded by luxury and with ample opportunity for development—yet here are often seen the sordid natures: natures with no love for the beautiful, no aspirations, no lofty ideals.

How do we explain our sudden and unaccountable likes and dislikes for people—our impulses to do kindnesses to those whom we have scarcely met? May not this be simply the meeting of an old friend, or a desire to pay an old debt—one contracted in a past life? Is it not also reasonable to suppose that our likes and dislikes are recognition of old ties—happy or unhappy ones?

Every belief assures us that ties of love are never broken, and that we shall finally be united to those whom we love. So Reincarnation gives us the same assurance that we shall come back to those we love; but this law, to be consistent, must also bring us back to those whom we have hated, in order that we may learn to love.

The Soul demands a perfect life. Life means progress—evolution. Is one life long enough in which to attain perfection? Can we in so short a time learn to live in harmony with each other? Can we attain the highest possible development of all our faculties? And if life doesn't mean all this, it means nothing!

Jesus said, "Be ye therefore perfect, even as your Father which is in heaven is perfect." Either we accept these words of a Master, or we do not. If we do not accept them we make Jesus out to have been a false Teacher who said what he did not mean. If we do accept them, we must accept also his endorsement of Reincarnation.

When we come to a realizing sense of our innate Divinity—that all men are children of one Father and "Sons of God," therefore capable of perfectibility, then and then only can we find a reason for being at all.

If there were only *one* instance recorded of the teaching of Reincarnation by Jesus, it should be sufficient proof of his endorsement of the doctrine to satisfy those who profess to believe in his teachings; but there are many illustrations in the Bible.

Job xiv: "If a man die, shall he live again? All the days of my warfare would I wait till my release should come." "I was an ingenious child, and received a good soul: nay more, being good, I came into a body undefiled."

St. John, ix. 2: "And his disciples asked him, saying, Master, who did sin, this man or his parents, that he was born blind?" If the man had only come into being at that birth, he had had no time to sin, he must have had a pre-existence, and the return to life again was a rebirth.

Matt. xvii. 10-13: "And his disciples asked him, saying, Why then say the Scribes that Elias must first come? And Jesus answered and said unto them, Elias truly shall first come, and restore all things. But I say unto you that Elias is come already and they knew him not, but have done unto him whatsoever they listed. Likewise shall also the Son of Man suffer of them. Then the disciples understood that he spake unto them of John the Baptist." Here is a direct instance of the teaching of Reincarnation in the words of Christ himself—that Elias had reincarnated as John the Baptist.

Rev. iii. 12: "I him that overcometh will I make a pillar in the temple of my God, and he shall go no more out." One must infer from this saying that he who does not overcome must go out or be born into earth-life until he does overcome.

Heb. ii. 10: "For it became him in whom are all things, in bringing many sons unto glory, to make the captain of their salvation perfect through suffering." "Though he were a Son, yet learned he

obedience by the things which he suffered." These texts seem to indicate clearly that Jesus did not attain perfection in one life. He too, must have lived and learned by living, and it is this humanity of Jesus that touches the human heart and makes men aspire to be like him.

Who, if he really loved humanity and pitied it in its upward and painful struggle, would be willing comfortably to take his ease in heaven while his suffering brothers lived and struggled on? An ancient Teacher once said: "Never will I seek or receive private individual salvation, never enter into final peace alone, but forever and everywhere will I live and strive for the universal redemption of every creature, throughout the world."

Who are the great lovers of Humanity, the Helpers of the race, sometimes called the "Elder Brothers," who "incarnate from age to age for the preservation of the just, the destruction of the wicked and the establishment of righteousness"? (*Bhagavad Gita*, ch. iv, p. 31.) They are "the Souls of just men made perfect"—Souls that have by pure unselfish lives spent in the service of Humanity earned the right to "Heaven," and then have turned back from this open gateway through which streamed the perfect light, and retraced their steps, Pilgrims once more, voluntarily returning to earth-life to help others to find Truth, Light and Liberation. Does this in any way lessen their Divinity, or make them any the less worthy of our gratitude and devotion?

There is much current nonsense in the world regarding this law of Reincarnation, which probably goes far to prejudice sceptical people. We see examples of this in those who go about declaring that they are incarnations of great men and women of the past—but it is noteworthy that those who make such claims rarely show in their *present* incarnation evidences of greatness. Another foolish idea is that we reincarnate in the bodies of animals. Any thinking man or woman knows that once we have attained to the human state, progression must ever be onward and upward, not backward and downward. A sincere seeker after Truth will pay no attention to such declarations except to protest against them. When we reach the stage in the course of our evolution where we do remember our past incarnations, we shall have too much sense and real wisdom to talk about them, even though we were conscious of all past events. The evolution of a soul is too sacred and true greatness never has to introduce itself to gain recognition.

Let us ever remember that our lives and circumstances are the results of causes which we ourselves have set in motion, in previous lives, and under this law of cause and effect, called in Theosophy Karma, must they be worked out. This divine law, which is absolutely just, says that whatsoever a man sows that shall he reap, not in some far away sphere, but just where he sowed the seed, there must he reap it.

"The tissue of the life to be,  
We weave with colors all our own,  
And in the field of Destiny,  
We reap as we have sown.

Still shall the soul around it call  
The shadows which it garnered here;  
And painted on the eternal wall  
The past shall re-appear.

O no! we live our life again,  
Or warmly touched, or coldly dim,  
The pictures of the past remain;  
Man's works shall follow him."

The soul must have needed for its experience just the body and the environment which it has and through which it is trying to express itself; so all our experiences must belong to us, since the Soul is the Knower. We cannot measure the existence of the soul by that of its frail tenement, the body. We cannot compress its countless experiences into a few short years.

In this forgotten truth of Reincarnation lies the

## THE THREE QUALITIES

**G**OOD is the Intellect which comprehends  
The coming forth and going back of life,  
What must be done, and what must not be done,  
What should be feared and what should not be feared,  
What binds and what emancipates the soul:  
That is of *Sattwan*, Prince! of "soothfastness".  
Marred is the Intellect which, knowing right  
And knowing wrong, and what is well to do  
And what must not be done, yet understands  
Naught with firm mind, nor as the calm truth is:  
This is of *Rajas*, Prince! and "passionate!"  
Evil is Intellect which, wrapped in gloom,  
Looks upon wrong as right, and sees all things  
Contrariwise of Truth. O Prithā's Son!  
That is of *Tamas*, "dark" and desperate!  
—*Bhagavad Gītā* Book xviii (Sir Edwin Arnold's rendering)

explanation of all the problems of life, and a great hope for humanity. It assures man of limitless opportunities to achieve, to love where he has hated, to redress all wrongs, to do kindness where he has done injury. This is the demand of the Soul—the perfection of human life. The prevailing unrest in the world at the present time is because men are feeling the soul-urge. The soul must express itself through the instrument which it has to use. We, by our thoughts and acts construct these instruments, and according to their perfectness or their defectiveness do we help or hinder the progress of the soul. It is the intuitive knowledge of this law of Reincarnation which prompts children to ask the often perplexing questions which they do, about birth, death, and other things concerning natural law. They are asking us to help them to recall the knowledge which has, in the interval between lives, been partially forgotten. A child is never too young to be told many truths concerning life—truths told in language suited to his understanding, and in harmony with the ideal world in which he lives. When he demands knowledge, then is the time to give it, and if we turn him aside with an evasive answer (or worse still, with an untruth) we may have forever closed a door—we may have put a stumbling block in his way—we may have lost the opportunity to help a Soul on the Path.

This truth of Reincarnation has its great value, not in the fact that Jesus taught it, but because it helps men to live and to understand life, and because it is *true*.  
M. H. K.

## THEOSOPHICAL FORUM

Conducted by J. H. Russell

**Question** In the maelstrom of conflicting theories regarding life and its purpose, and the relation between life and so-called death, what is the message that Theosophy has to give to the world? Can it give any certain light on the subject? What is the real life? Will you kindly take up this question in the Forum. (*Concluded from last issue*)

**Answer** III. The experience of students of Theosophy is that it does indeed give light upon this question, showing the great purpose of life and the relation between our life and that which we call death. First of all, as to the purpose of life: In order to understand this it is necessary to know what man is; what his real nature. Theosophy teaches that man in his real nature is divine, truly a son of God; that he enters into what we call life, that is, into material existence with a double purpose. First of all to gain experience and a perfect expression of his own divine nature; and second, that of helping on all other beings towards the same

end. In reality this twofold purpose is but one, for it is a part of divinity itself to work for others.

Many others besides Theosophists have taught the divinity of man, but have been able to give no satisfactory solution of the difficulties which beset him or of life as it is lived now, in which so little of the divine is manifested. It is here especially that Theosophy gives such help to the student. It teaches not a single life of but a few years and then an endless heaven or hell dependent upon what has been accomplished in that short time, but it teaches and demonstrates that man lives many lives on earth; that he swings as a pendulum between so-called life and death, with power to rise higher and higher towards the divine. Each life is a field in which we both sow and reap; today we are reaping the harvest of seed sown in many past lives, and today also we are sowing seed that will bear fruit in lives to come.

Some, looking at the recurring cycles of birth and rebirth, of life and death, and yet not being able to grasp the vastness and the scope of human evolution, have looked upon this teaching but as a mere tread-mill repetition. It is because they have had but a very limited view of the whole teaching. The other side must be presented with its ever widening power of consciousness that is ours to attain to, and that with each life well lived we return to earth with *added* powers, with a *widened* horizon, with a *deeper* consciousness of the reality of life. It is not a tread-mill of repetition but an ascending spiral of ever widening sweep, until at last we reach again the goal from which we started, that of divinity—the same and not the same, for it is with a higher consciousness, with a wider experience, that we re-attain our godlike state.

From this standpoint all the trials and difficulties which we have to meet take on a new meaning; they are at best but for a day, like the buffetings of the storm which give strength to the growing tree destined to become the monarch of the forest; and though in each earth life our bodies apparently succumb to the pains and ills of mortal life, yet the body is not the man. The real man, the soul, rises from the struggle stronger, with greater power and wider vision and the strength of that which it has had to fight against has through its overcoming been added to its own. We learn that the trials and sufferings we have to endure are of our own making and consequently are not something to be shunned or avoided, but to be bravely endured that so we may learn the lesson they have to teach.

One other point that is most important: What is the purpose of life? And what is real life? Theosophy teaches that it is not for himself that man lives; it demonstrates the truth of the old saying that no man liveth unto himself and no man dieth unto himself. However much appearances may be to the contrary no man can isolate himself from others or live his life apart from the interests of others, for he is linked to all of human kind and to the whole of nature both on the outer and the inner planes. Every thought that he thinks, every intention or aspiration that he has, sets in motion the currents of the thought world which affect the thought atmosphere of the whole human race. And the

very thoughts, according to their intensity, may find lodgment in other minds.

One of the most important teachings of Theosophy in regard to life is that of human solidarity as a fact in nature, and thus the purpose of life is not that which applies to the individual alone but embraces all humanity. To understand the deeper meaning of life and its true purpose man must live less for himself and enter more into the life of others about him and the life of humanity as a whole. As it is today we know but little of the possibilities of life as they will be unfolded to us when the whole human race acts as one.

While we are fighting and struggling one with another our life is as it were comparable to the life of single cells in the human body separated from the human consciousness, each living its own puny life apart from that of the organism to which they belong. That indeed will be life glorious beyond conception when the human units, our individual selves, no longer acting each for his own petty self but actuated by the mighty purpose of the self of all Humanity, share in and mirror the consciousness of the Over-Soul. STUDENT

**Question** I suppose you Theosophists, like everyone else, have some panacea to prescribe for all the woes that afflict mankind?

**Answer** Well, it must be confessed we have. William Q. Judge, the second of our three Teachers, says, in one of his books:—"What then is the panacea finally, the royal talisman? It is *Duty*, selflessness."

**Question** Duty? That has been preached these thousands of years. So has selflessness. We want something more than that. Why should these ideals have greater force when proclaimed by Theosophy?

**Answer** Of all subjects, people are most profoundly ignorant of their own human nature. We do not understand the processes of feeling, the connexions between thought and action, the subtle play of motives and the effects of these upon our lives. Ethical precepts are generally admired when temptation is *not* in the field, and forgotten when it is. The mere enunciation of ethics does not throw any particular light on the workings of our own minds and desires, and unless you understand the machinery, how can you hope to govern the machine?

**Question** By which term I suppose you mean, oneself? How can one hope to govern the machine anyway, Theosophy or no, when one is that machine oneself?

**Answer** That is where Theosophy begins to illuminate things. You should read the works by Madame Blavatsky, her *Key to Theosophy* in particular. That book shows that there is really a master of the machine, which we may call the Soul; how he may be awakened and brought into control of the whole working of it: also about the machine itself and all the principles and laws involved in it. So you see, Theosophy does not merely say:—Go on turning the handle and producing the finished article, duty. It shows you where to look for the broken screw, the worn-out cog, or the wheel that wants oiling. STUDENT

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## The Shadow of Memory

"AND, saying she would ne'er consent, — consented"; is a line that comes irresistibly to one's memory in reading a recent article in the (London) *Spectator*. Reincarnation cannot, shall not, be a fact; — and yet — and yet — it certainly is one.

The theme of a part of the article is instinctive sympathy.

Instinctive sympathy is a fascinating subject. The only theory by which it can be wholly accounted for is one which has always revolted the Western imagination — the theory of a former existence. Europeans cannot take such an explanation seriously.

Since when could they not? Since the Church made the belief a formal heresy? But that they *are* taking it seriously, and that the idea is in the air, is shown by the foreboding assertion. The article goes on:

For all that, it is impossible not to reflect how very near to the region of memory this psychological instinct lies, how very near alike is the sense of the familiar and the sense of sympathy. We say that we feel at home when we mean that we are in congenial company, and occasionally when we meet a complete stranger we have a haunting sense that our acquaintance is of long standing.

But is the writer really a friend of the theory, praising it with faint damning? Is he arguing for it with just a preliminary sop to the orthodox Mrs. Grundy? For the theory precisely is that we are thrown life after life with those to whom we are tied by real love and sympathy. The "haunting sense" is rather memory itself than "very near to the region of memory." It is nearly as much of the memory of former lives as he who has not regained his full soul-consciousness, can get; as much as is possible to one whose consciousness is so nearly limited to a brain that was new for this life and was furnished only with the record of this life. That there *is*, however, a deeper, fuller memory, the "haunting sense" is witness.

## The Nation versus the People

THE above distinction is made for present purposes only, and is not intended as a definition or to be observed on any other occasion. But one must have words to describe the state of affairs which arises when we see the Nation intervening, like a provid-

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

ence, to undo the mischief done by the people. The allusion is to the steps being taken by the Government to prevent future waste of natural resources.

Thus we see that the Nation is not merely the sum-total of the people; it is something a great deal more. It might be better to call it the National Conscience and to define it as the sum-total of the people's better selves.

There is more than one kind of union, and not all unions are good. Selfish interests can unite to further their own advantage at the expense of those not included; and, though such unions, being based on selfishness, have not the seeds of permanency, they may yet endure long enough to work great mischief. We have to guard against this misuse of the principle of collaboration — wherever found, among the rich or the poor, in whatever class or calling.

But the collective action of people endued with unselfish far-sighted motives is a union containing the seeds of permanence. It may be called the national (or international) conscience.

Theosophy, seeing realities where others see only abstractions, regards the national conscience as an actual entity. It is not merely the aggregate of individual motives, but has an existence of its own. As the human body has a life of its own, to which the individual lives of the cells and organs are subordinate, and is not merely the aggregate of these individual lives; as man's essential being is not merely the sum-total of his moods and feelings, but is an independent overruling existence; — so a nation is something more than the aggregate of its members; it has an existence of its own. This may seem a strange belief to minds that have formed the habit of viewing things wrong side up. But Theosophy views things as proceeding from unity to diversity, not merely as being built up from diversity to unity.

Thus, while in the scientific view man is an

aggregate made of many units, Theosophy regards him as primarily a unit, which unit is differentiated into many subordinate parts. The life-principle is not the totality of the lives of the cells, but an independent existence which rules over and coordinates the lesser lives. So also man has an Individuality which is independent and rules

over the lower elements of his nature. Applying this to the case of humanity, we get the idea that a nation or a race has an individuality as such, apart from the collective effect of its individual members.

This race-individuality will become more manifest in proportion as people cherish disinterested motives and impersonal ideals — think and feel more as members of a family. Thus it will form the basis of a true unity of interest and action. Ignoring this aspect of the matter, some sociologists have sought the basis of union in a pooling of separate interests which they have denoted under such phrases as "the greatest good of the greatest number." The notion that superior powers are evolved from below, generated by the friction or mutual adjustment of inferior forces, is in line with the general view of modern science, which seeks to derive the whole from its parts.

The idea that a national or international conscience is an ensoulment from above is in line with the idea that the human Soul is an independent existence from above. Instead of being the mere result, least common multiple or highest common factor, of the individual units, it is in each case a *Deus ex machina*, which steps in and takes charge of the whole.

Whenever, therefore, we hear the cry that the future welfare of humanity is to be regulated by a politic adjustment of self-interests or class interests, let us try to remember that there is a higher Law, whose recognition may mean a *second birth for humanity*. We have been told that "He who seeketh shall find: and to him who knocketh, it shall be opened": and perchance those who seek and knock may find the gateway of a larger life opening out within their heart. But it does not need much seeking to find opportunity; opportunities to obey higher calls than those of selfish interest come hourly, and in proportion as we obey them we shall nourish our higher nature and open the gates of understanding. ## LAST SUNDAY AT ISIS THEATER

Prof. H. T. Edge Concludes his Address on  
Theosophy and the Bible

A VERY large and attentive audience listened to Mr. Edge's fifth and concluding lecture last night on the above subject. The Point Loma Orchestra gave several musical selections which were heartily appreciated by the audience. Mr. Edge said in effect:

Friends, this last lecture will be partly a summary of the previous four lectures, and partly new matter. In speaking of Christianity a Theosophist has no desire to destroy the faith and peace of mind of any one; for the message of Theosophy is one of peace and hope. But few thinkers will deny that Christianity today is in a very unsettled condition, and its ministers are in doubt as to what their religion really consists in. It is powerless to face the problems of today, and men are ceasing to look to dogmatic teaching for light and guidance. In short, religion needs a revival in a truer sense than any ordinary revival. We need to penetrate beneath the accumulation of dogmas, interpretations, ecclesiastical inventions, and false history, to the inner spirit of Christianity, and to resurrect the Christ-spirit from the tomb wherein it has so long remained buried.

We have seen that the Bible consists of the Old Testament and the New Testament. The Old Testament is a compilation of Hebrew books which were selected from a large number of possible ones; the rejected ones being known as the Apocrypha. In the early chapters of Genesis we have a cosmogony which scholars show to have been derived from the ancient Babylonians. But it might be traced equally well to Hindû, Persian, Egyptian, or even American sources. In all the ancient scriptures the same symbology is used. Man is first an animal soul, and then the Divine Mind is infused. In every cosmogonic mythos there is a flood, an "ark" with a Noah; and birds are sent forth. In many such mythoi there are stories of giants etc.

The comparison of creation mythoi is a question of study, and we cannot fail to see that they have all been derived from a common source far antedating Christianity. This source was the Wisdom-Religion, which was very widely diffused and was, indeed, the common religion of humanity. Teachings were given symbolically for the uninitiated, and there were schools of initiation where the symbols were explained. All religions have sprung from the Ancient Wisdom-Religion, as languages have a common root-language, and races a common root-race. Theosophy is the key to the ancient symbols and sacred writings, for it is a revival of the Ancient Wisdom-Religion.

The New Testament Canon is a collection of gospels and epistles selected from a large number and compiled at some unsettled date or dates in the early centuries after Christ. Classical sources give no certain testimony for the existence of the historical Jesus; but there is a rabbinical tradition about Jesus or Jehoshua son of Pandira, as having lived a century earlier than the one called Christian. He was accused by the Jews of having learned magical arts in Egypt, and was put to death by the Sanhedrim at Lûd or Lydda. Practically all contemporary sources of history are silent about him. But we may gather that a great Teacher did live sometime about the Christian era, and that he was

an initiate into the ancient Wisdom. From his teachings, from a multitude of Pagan sources, and from Hebrew traditions the Christian religion was gradually put together in those early centuries, and from time to time was modified by the addition of dogmas through the dark ages and medieval times.

About the time of the Christian era schools or sects existed which studied, practised, and taught the ancient Mysteries on the same lines as the Egyptian and Greek schools. One of these was the *Essenes*, of whom we find an account in the *Encyclopaedia Britannica*. From this we learn that the *Essenes* appeared about the second century B.C. and were an exclusive society which practised severe asceticism, and benevolence. They had fixed rules for initiation; were the first society in history to condemn slavery in theory and practice; they enforced a complete community of goods; and while their tendency was practical they kept the tenets of their society a profound secret. It is clear they deviated from the normal Judaism, and had a profound sympathy with Greek philosophy, and probably also with Oriental ideas. They were very temperate; among them oaths were forbidden; they despised riches; and were bound by the most awful oaths to reverence the deity, do justice to men, and hurt no man voluntarily or at the command of another. They held that while the body is mortal the soul is immortal, and coming from the subtlest ether has been lured by a sorcery of nature into the prison-house of the body. Josephus says the *Essenes* lived the same kind of life as the *Pythagoreans*.

We find another body of people called the *Gnostics* flourishing during the first three centuries of the Christian era. The term *Gnosis* was given to the spiritual sacred knowledge taught in their schools after initiation into the Mysteries. The *Gnostics* may be traced to Egyptian, Chaldaean, and Hindû sources. We discover in these early centuries a deathly struggle between this ancient philosophy and the spirit of dogmatism and bigotry, which struggle ended in a victory for the latter, and the conversion of fragments of the ancient *Gnosis* into an ecclesiastical and dogmatic religion.

Such evidence as we can glean from ancient Hebrew accounts indicates that Jesus was an *Essene* and went through initiations, afterwards teaching the ancient philosophy.

About the term "Christos" there is much confusion. It is generally admitted to have been not a name but a title applied to initiated persons. Theologians make it the equivalent of the Hebrew word "Messiah," or "anointed," (?) but the Greek word *Christos* had several far deeper senses. As a word literal it means "something to be rubbed on" and was used of ointment. It is hardly possible that the Greeks of the time of Jesus would have translated the word "Messiah" by such a word. Some trace the origin of the word to the Hindû Krishna, others to the town of Krisa. It was applied to initiated persons long before the advent of Christianity. There is also the word "Chrestos" meaning a worthy person. This term is used by classical writers of the pre-Christian age. Clemens Alexandrinus says: "all who believe in Chrest both are, and are called Chrestians," that is, good men. These two words *Chrestos*, and *Christos*, have been confused.

Now to pass to another very important point of Christian doctrine, salvation by faith, built on a passage in the last chapter of the Gospel of Mark,

"Go ye into all the world and preach the Gospel to every creature. He that believeth and is baptized shall be saved; but he that believeth not shall be damned." We find in the margin of the Revised Version that "the two oldest Greek MSS. and some other authorities omit from verse 9 to the end, some other authorities have a different ending to the Gospel." Thus we see that these verses were added to the Bible at some later time, obviously in the interests of dogma. Elsewhere there are other such additions of words or sentences not found in the older MSS. So much for the text upon which so much dogma has been built.

H. P. Blavatsky says, in *The Esoteric Character of the Gospels*, p. 248: "The *Gnosis* was the echo of the Wisdom-Religion which had once been the heirloom of the whole of mankind; and therefore one may truly say that in its purely metaphysical aspect, the spirit of Christ (the divine *Logos*) was present in humanity from the beginning of it. The author of the *Clementine Homilies* is right; the mystery of *Christos* . . . now supposed to have been taught by Jesus of Nazareth . . . was identical (as he says) with that which from the first had been communicated to those who were worthy. . . . The surname *Christos* is based on, and the story of the crucifixion derived from, events that preceded it. Everywhere, in India as in Egypt, in Chaldaea as in Greece, all these legends were built upon one and the same primitive type, the Voluntary Sacrifice of the *Logoi* . . . the rays of the *LOGOS* . . . whose rays are incarnated in mankind."

Again, in the same book, H. P. Blavatsky says: "The adepts who lived and died for humanity, have existed in many and all the ages, and many were the good and holy men in antiquity who bore the surname or title of *Chrestos* before Jesus of Nazareth, otherwise Jesus (or Joshua) ben Pandira, was born. Therefore one may be permitted to conclude with good reason that Jesus or Jehoshua, like Socrates, like Phocion, like Theodorus, and so many others surnamed *Chrestos*, i.e. 'the good and excellent,' the gentle and holy Initiate who showed the 'way' to the *Christos* condition, became himself 'the way' in the hearts of his enthusiastic admirers."

All religions have their origin in the Wisdom-Religion; their legendary basis is supplied from various sources. In Christianity the teachings attributed to Jesus are Gnostic in their origin; and the *Gnostics* were the Theosophists of that day. The historical story of Jesus was derived from Jewish sources. But, even more important than the origin of Christianity is the study of its essential teachings apart from the dogmas and superstitions that have accumulated round them.

We have seen that the worst delusion was created under the name of the "atonement." This doctrine had its origin in two sublime facts; first, that the *Christos*, or Divine Soul in man undergoes a voluntary sacrifice when it enters into terrestrial life, there to be crucified by the passions, until, conquering death and delusion, it is resurrected from the tomb of the flesh, and thereby saves man or redeems him—buys him back to his original blessedness. Second, that in the Mysteries, the initiated priest vowed to offer himself as a sacrifice for the candidates, taking upon himself the responsibility for their mistakes. For an Initiate is pledged to the life of Divine Love, and, purged from the love of self, his only object in living is that he may help and serve. This was called the Mediation or atonement, and upon it has been built the church dogma of the atonement, which teaches a very different

thing. Fortified, as has just been shown, by forged texts, the doctrine has been preached that mankind is unworthy and without power of self-help; and that man is forgiven and excused, and taken to heaven in spite of his sins by the vicarious sacrifice of the only son of God.

This teaching has kept humanity back by destroying in man the sense of his own divinity, and thus making him the tool of those who would profit by his weakness. No such doctrine was taught by Christ. Theosophy comes to teach anew the ancient teaching of Christ, that man is created in the image of God and that in him resides the Eternal Will, and the Eternal Intelligence, and the Eternal Love. These powers, man must himself evoke from the depths of his own nature; for heaven helps those who help themselves.

Again and again the noble, free spirit of man rises in protest against false theology, and establishes orders of Chivalry, Masonry, and independent endeavor. To these the church is at first opposed, but finding that they cannot be stopped, it patronises them, and gives them a religious twist.

In many places today the public conscience is rising against authority. Everywhere we see that the last court of appeal is the voice of intuition in the people. This voice in the past has determined all questions of faith, and religions are but the formulations of man's beliefs from time to time. When man's mind enlarges, the religions have to enlarge or perish.

Theosophy recognizes this last court of appeal; it addresses the hearts of the people, and calls them to turn away from superstitions and listen to the voice of their own better selves.

The key to Christ's teaching is surely the law of Love, Love in its highest, purest sense, compassion, self-forgetfulness, altruism. Many have recognized this but have been held back from realizing it by the dogmas. In all religions this quality of self-forgetfulness has been made an essential; but many have been hindered through ignorance of man's nature and the laws of life. Reincarnation, and the perpetuity of the real Self through all lives have been forgotten. But Theosophy teaches that self-forgetfulness is the key to perfection, wisdom, and happiness, the solution of the great mystery of life, the mystery of the Sphinx, and that it brings its reward here.

Paul a student of the Gnostic Wisdom, and the opponent of Peter the dogmatist, says: "My little children, of whom I travail in birth again until Christ be formed in you." Theosophy teaches men how to form the Christos in themselves, that is, how to become true men.

Again, religion has been separated from knowledge, thus making knowledge profane or secular. But we should not be afraid of our intelligence nor dread that it will lead us away from the true Life and Faith. We need it all. The new knowledge which we have in the world, the discoveries of science, the finds of archaeology—all these but broaden and exalt our ideas of religion. We see that the Truth is Eternal, and that the Divine Spirit has always revealed itself to the human understanding whenever men have offered the requisite conditions. The world has many Bibles, and not one only, and the key to them all is the one fundamental system from which all were derived—the Wisdom Religion of the ages, Theosophy. OBSERVER

### Does Modern Science Rule the Universe?

THE notions which some opponents of Theosophy have of its nature are of the vaguest, and certainly not founded upon even a slight study of its teachings and claims. This is not an uncommon attitude on the part of opponents in general towards the systems they oppose; and there are always plenty of

misrepresentations current to confirm them in their misunderstanding.

A correspondent, who is opposed to Theosophy—or thinks he is—or is opposed to something that he thinks is Theosophy—sends a copy of the weekly journal *Science*, containing a report of the address of the retiring president of the American Association for the Advancement of Science. This address is by a representative of the science of medicine, Professor William H. Welch, and is entitled "The Interdependence of Medicine and Other Sciences of Nature."

Our correspondent appears to labor under the impression that his sending it, with passages marked, constitutes a grave argument against Theosophy; but to us it appears entirely devoid of relevancy to the subject, nor can we detect any trace of an issue raised by the address between science and Theosophy. Indeed the journal in question is currently received by the CENTURY PATH, and the address had already come under notice without leaving any other impression than that of a well written and informing article on the history of medical science.

The notion that Theosophy can be in any way perturbed by a lucid presentation of the history, progress, and aims of science, seems to imply that some people regard Theosophy as a rival of science. It may therefore be well to quote the words used by H. P. Blavatsky, the Founder of the Theosophical Society, in the introduction to that part of her second great work which she devotes specially to the relation between Theosophy and science:

So far as Science remains what in the words of Professor Huxley it is, namely, "organized common sense"; so far as its inferences are drawn from accurate premisses—its generalizations, resting on a purely inductive basis—every Theosophist and Occultist welcomes respectfully and with due admiration its contributions to the domain of cosmological law. There can be no possible conflict between the teachings of occult and so-called exact Science, where the conclusions of the latter are grounded on a substratum of unassailable fact. (*The Secret Doctrine*, Vol. I, p. 477.)

In harmony with the above statement, then Theosophists read with due admiration and respect the interesting *résumé* of the contributions of science, past and present, to the domain of cosmological law. They can follow the writer through his description of the work of physicians from the earliest historical times down to the present day, and through his explanations of the bearings of physics and chemistry upon medicine. But they fail to see just what this has to do with the position of Theosophy as regards science, or where it can be deemed to constitute an attack upon Theosophy.

But for the benefit of any who think that Theosophy will quail before a presentation of science, let us continue the quotation from H. P. Blavatsky:

It is only when its [Science's] more ardent exponents, over-stepping the limits of observed phenomena in order to penetrate into the arcana of Being, attempt to wrench the formation of Kosmos and its living Forces from Spirit, and attribute all to blind matter, that the Occultist claims the right to dispute and call in question their theories. Science cannot, owing to the very nature of things, unveil the mystery of the universe around us. Science can, it is true, collect, classify, and generalize upon

phenomena; but the occultist, arguing from admitted metaphysical data, declares that the daring explorer, who would probe the inmost secrets of Nature, must transcend the narrow limitations of sense, and transfer his consciousness into the region of noumena and the sphere of primal causes. To effect this, he must develop faculties which are absolutely dormant—save in a few rare and exceptional cases—in the constitution of the offshoots of our present Fifth Root-race in Europe and America. He can in no other conceivable manner collect the facts on which to base his speculations. (*Ibid* 477-8.)

But this the writer in *Science* admits, for he says:

The ultimate problems of reality and of knowledge belong to metaphysics, which we may, following Descartes, bury deep in the soil at the root of the tree of science.

Theosophy avers that a science whose range of observation is limited to that of the physical senses, cannot, on that basis, build a philosophy sufficient for the needs of humanity; and points to the world today in illustration of that point. *The world is not ruled by modern science*, in spite of how it may seem to some scientists whose enthusiasm for their occupation has given them an exaggerated idea of its value, for the statement is one-sided. Science has contributed largely to the material resources of mankind, and has done grand work in aiding to free men from the bonds of a cramping and dogmatic theology; but who will be so bold as to say that it has solved the great ever-present problems of life? In face of such problems, confronting us more menacingly than ever today, and even increased in their intensity by the very discoveries of science, science stands helpless. Its theories as to man's nature and destiny, founded on a study of physical nature, tend to contradict what man knows and feels to be true and to present him with an altogether untenable and intolerable conception of his own being.

Theosophy has plenty of admiration for great scientists, so long as they do not claim that their own particular branch of study is the last word of knowledge and the sole salvation of humanity. Such bigotry is worthy only of the narrowest religious sects, and is not cherished by the real leaders of science, who are men of judgment and modesty.

Not today only, but throughout the ages, as those who have studied history know, there have been people who have dreamed that life could be regulated by a purely artificial system; just as there are and have been people who believe that a dogmatic religious basis is all-sufficient. But neither one of these is broad enough to satisfy the needs of Man; and his real guide, throughout the ages when these moonlights have shone, has been that light which has welled up from the depths of his own nature and infused his doubting mind with gleams of intuition and noble incentive. It is this inner light that has enabled him to throw off the shackles of both religious and scientific dogmatism, when these have threatened to choke him. To this light he looks for his future hope. He has no great expectations from either religious or scientific orthodoxy, for he realizes that these do not lead but follow. But true science is something apart from its dogmatic counterparts; the ancient *Gnosis* was founded on *Self-knowledge*, not merely on a study of externals. E.

# Art Music Literature and the Drama

## Some Notes on Ancient Greek Music

MUCH more light has been thrown upon the drama than upon the music of ancient Greece. While there are many Greek hymns of antiquity known to the present world, a large number of these partake more of the darkened period of Greek musical history than of the enlightened but as yet obscured epoch.

Some of these hymns are as follows:

A hymn found at Tralles near Ephesus written by Seikolos, 100 A.D.; two hymns attributed to Dionysos 117 to 138 A.D.; one written by Mesomedes about the middle of the second century A.D.; and the hymn to Apollo, date uncertain when first found but thought to be 2000 B.C., later given 278 B.C.

This Hymn to Apollo is by far the most beautiful and satisfying of any hymn so far found. It was discovered in May 1893 by the French Archaeological School at Athens, in the Treasury of the Athenians at Delphi. It was engraved on marble slabs, the greater part of the hymn being thus preserved. Without doubt it is a religious song of triumph in praise of Apollo, to commemorate some event, perhaps the victory of the Phocians over Brennus the Gaul in 278 B.C. If this be the fact, as modern archaeologists contend, it has a comparatively modern origin.

When one begins to delve into antiquity a period of two or three centuries B.C. does not seem so far removed from us. But we are inclined to the opinion that the music, if not the words, of this "Hymn to Apollo" had its inspiration from an older source, entirely different from that of the others now known. There was without doubt a period in the history of Greece when music had as perfect a symmetry as sculpture and carving—and evidences of this can be found today amongst the old folk songs of the people which are not available to the ordinary curiosity seeker. One great peculiarity of the old Greek music was that the rhythm of the melody was controlled by the rhythm of the words. This knowledge was given to the Greeks by the Egyptian teachers of music and theory who knew the power of sounds through the rhythmic flow of the words. This Hymn to Apollo has a peculiar, rhythmic melody, unusual to modern ears, but which exerts a remarkable influence upon all listeners, notwithstanding.

The first public performance ever given of this hymn was by the students of Katherine Tingley in the first production of Aeschylus' *Eumenides* in this country in New York City in 1898, although previously a private hearing had been held before the Royal Family at Athens, Greece, soon after the hymn was discovered. It does seem significant, however, that Katherine Tingley should present the opportunity for this most beautiful of religious hymns to be revived, and who could more truly interpret these echoes from the past than her own students? The melodious song and noble rhythmic dance, are truly blended with the courageous warrior-spirit in the words of this magnificent ode. The fol-

lowing translation is by M. Henri Weil. Even without the music, the words alone seem to enfold one with the very atmosphere of "lofty, sky-reaching Olympus."

I will sing in praise of thee, glorious son of Zeus! Who dwellest on the snowy peak of the hill, where in sacred oracles, to mortal men, thou dost proclaim tidings prophetic, from the divine tripod seat. Thou hast driven forth from his place the dragon who watched over the shrine, and, with thy darts, hast forced him to hide far in the dark underworld. And as thou drovest forth the fierce serpent, so hast thou conquered the Gaul.

Muses come from deeply-wooded Helicon, beauti-

mark whose death recently occurred. Like old Vikings both loved the sea and its wideness, where the sun can lavish all its richness and diffuse its gold, and the strength gained by the inspiration of this intimate touch with nature in its real grandness shines through the life-work of both. The noble voices of these two silver-haired Skalds, so laden with soul-courage, are no more heard in the North. But in the silence that reigns we draw in a breath of the aroma of their lives, in their highest aspirations we catch a glimpse of the real men that they were. They stand as imperishable links between us and the inner

Lomaland Photo. and Engraving Dept.

THE NEW TOWN HALL, CARDIFF, WALES

ful fair-armed daughters of the loud-singing god who dwells there: praising their noble kinsman, even Phoebus with golden hair. To the lyre sing they their songs. He hovers o'er the twin-headed peak of Parnasse, and he haunts the rocky places, round about famous Delphi and Castalia's plentiful springs, full of waters deep and clear; and presides over Delphi, with its oracle true in prophecy. Come ye, then, here Attica's noble daughters come, ye who dwell in Tritonis' fertile plain, safe from the foe's death-dealing shaft; incense and the sacrifice off'ring, Hephaestus kindles sacred fire, burning on the altar limbs of bulls, while the smoke rises up and reaches to Olympus; and from the flute's powerful voice, come forth melodious, beautiful tones, spreading around. And the lyre's golden notes join in the hymns, aiding in the melody; while in a throng Athens sends chosen bands unto the shrine.

STUDENT

## Holger Drachmann --- The Danish Poet

THE great ideals of King Oscar were closely followed by his friend and brother in the world of poetry, Holger Drachmann, the great lyric writer of Den-

mark whose death recently occurred. Like old Vikings both loved the sea and its wideness, where the sun can lavish all its richness and diffuse its gold, and the strength gained by the inspiration of this intimate touch with nature in its real grandness shines through the life-work of both. The noble voices of these two silver-haired Skalds, so laden with soul-courage, are no more heard in the North. But in the silence that reigns we draw in a breath of the aroma of their lives, in their highest aspirations we catch a glimpse of the real men that they were. They stand as imperishable links between us and the inner

Drachmann's tall, even royal, stature and easy manner, suggesting as it ever did, the radiance of sunshine and sea-breeze, called to the mind memories of olden days when the song of the Skald was a power in the North. when the Skald stood at the side of the Chief as his equal on the dragon-ship that cut the waves of foreign seas.

The poet Drachmann was a wanderer through many different ages and through many countries, and always his pictures bear witness of having been perceived and painted from above. They have the soul-touch. But always the wanderer returned to his native coast, and there we think of him as his friend, the artist Krøyer, has rendered him in his famous painting, with head uncovered, beside a fishing-boat on the beach, looking out over the waves which roll towards the shore and throw their pearls at his feet. STUDENT

Oh, the superb opportunities that life holds today! And so many women fail to grasp them.—*Katherine Tingley* in a recent address

**W**HAT our children cost us is a subject interesting both England and America at the present time, to judge from articles appearing in journals published on both sides of the Atlantic. The cost as usually counted is in dollars and cents, or pounds and shillings. The material outlay, the material sacrifice, seems to be of paramount interest. That this is an important issue at the present time, who can doubt, for there seems to be a culmination of the material problems of existence confronting the heads of families.

Just a few years ago the press in this country raised the warning against race-suicide among native Americans, and an insistent plea was urged for larger families. Yet today, the thoughtful cannot but admit that this much-to-be-desired end seems far from accomplishment; for it is undoubtedly true that much of the so-called "race-suicide" is forced on present-day Americans. Many children-loving home-makers are confronted with the question of the larger justice to their offspring, else no ideals of fatherhood and motherhood, nor yet of the rights of childhood can be maintained. Unfortunately for us as a nation, our present social and economic standards are such that in nearly all cases, the homes are virtually deprived of the fathers; for all the best energy of the honest industrious citizen goes into the well-named struggle for existence, a struggle against the man-made barriers of selfishness. The injustice to children of being deprived of the influence, training, and companionship of their fathers is incalculable. Admirable as the training of women may be, and should be, since today so much of the machinery of education is carried on for their benefit, it cannot be complete save in rare instances of wisdom and devotedness, for the touch of both father and mother is needed in the true home.

Yet what more can the man of family do

## What Our Children Cost Us

under existing conditions than provide for the material needs of his dear ones? And the more education, culture, refinement of nature the present-day father was able to receive in his own home, in quieter, less strenuous times, the more difficult he finds the struggle for existence today, the more of his best life energy he must put into it, and therefore the less he has for the higher duties of fatherhood. Many, many thoughtful devoted wives de-

### SONG OF THE ROSE SAPPHO

Metrical version by Elizabeth Barrett Browning

IF Zeus chose us a king of the flowers in his mirth,  
He would call to the rose, and would royally crown it;  
For the rose, ho, the rose! is the grace of the earth,  
Is the light of the plants that are growing upon it!  
For the rose, ho, the rose! is the eye of the flowers,  
Is the blush of the meadows that feel themselves fair,  
Is the lightning of beauty that strikes through the bowers  
On pale lovers that sit on the glow unaware.  
Ho, the rose breathes of love! ho, the rose lifts the cup  
To the red lips of Cypris invoked for a guest!  
Ho, the rose, having curled its sweet leaves for the world  
Takes delight in the motion its petals keep up,  
As they laugh to the wind as it laughs from the West.

plore this condition that binds their husbands to the slavery of satisfying material needs alone, but they see no escape from the difficulty; yet by acquiescence they increase the exigencies of the situation. Material wants make cogent demands, and husbands and fathers bend every energy to supply them. Thus it is little wonder that the press of two countries is bringing forward seriously the question of "the cost of the child," and reducing it to statistics.

That there is another side to this question, both higher and deeper, is obvious from the

beginning. Do we not owe our children that which cannot be computed in coin, that is not reducible to figures for some statistical table which a newspaper may publish? Are children fully prepared for life when we have given them proper nourishment, suitable clothing, adequate mental equipment and the refining influence of a comfortable home? The parents who do this do much, for think of the vast army of children who are in part or entirely deprived of these their just dues! In view of all that the man and woman of the future must face, these advantages are but tentative.

It is in the home that the strong moral fiber must be woven that will withstand the stretch and strain of circumstance; the perception trained to see and know the truth without and within, while standing unmoved in inward integrity; the inner eye directed to the stars. For, despite all prejudices to the contrary, the most practical inheritance that the well-wishing, thrifty parent can leave to his child is established character and high ideals. Balanced by character, these ideals open up the rich treasure-house of the heart-life with its wealth of love and imagination, the only real and inexhaustible source of happiness. Youth so equipped cannot be made bankrupt by change of fortune. Trials and tribulations will only serve to separate the golden grain from the worthless chaff, and every untoward circumstance will find the man or woman richer in abiding wealth. How often does it happen that loss of fortune utterly bankrupts men and women, leaving them wrecks in heart, mind, and body, miserable derelicts on the sea of life; or sends them to an early grave when they might have lived long lives of usefulness—nay, when it was the more their duty to do so?

The question now arises, "Have we been so prepared for fatherhood and motherhood, or is it so much the heritage of the race, that

we can pass on to our children this finely-forged, invulnerable armor?" With our homes dominated by the money question, forced upon us, as it were, by the exigencies of the economic situation, our young folk too easily take this as the main issue of life, subordinating to it all higher and finer interests; regarding as the end and aim of education the acquiring of as much as possible of this all-powerful "good." What else can they think when they note that it is the corner stone of our social structure; and when they observe that their beloved father works with might and main towards this end; while the smooth or wrinkled brow, calm or irritated nerves of the dear mother, depend on the state of the family exchequer? Is it possible to keep this omnipresent money-question out of the homes, so that the well-spring of our national life need not be tainted by it?

Yes! While a very, very few courageous and devoted men and women, those with a genius for fatherhood and motherhood, have always known the way and have been and are able to maintain the strict autonomy of their home-life, ruling together with wisdom and love, more and more thoughtful parents are finding the broader, deeper way by the light of Theosophy and the royal path of Râja Yoga. By the placing of children in the Râja Yoga School of Lomaland the parents remove them from the old life-stream with its fierce currents of selfishness and materiality, placing them instead where there is the gushing-forth of the well-spring of new life; where, in their youth, the fair qualities of mind, heart, and character may grow and blossom, pure and white as the petals of the Lotus, warm and golden as its heart; where they may learn as sweetly as the birds sing that the law of life is service, and, in the words of more than one Teacher, words often urged upon her students by Katherine Tingley, that "it is more blessed to minister than to be ministered unto."

And the cost of a child, a Râja Yoga child? This is what it costs: the sacrifice of the multiform and subtle forms of selfishness that the parents have absorbed from the old life currents, and which they know have blighted their own lives, preventing them from reaching full fruition. And the reward?—for William Quan Judge says that "the desire for reward is inherent in humanity, and is a reflection of the evolutionary law,"—is the knowledge that all human life will be lightened and sweetened by these young lives that have been enabled to grow strong, straight and beautiful by the sacrifices, the golden transmuted sacrifices of life's lesser and baser things which, gloriously indeed they cost their parents.

A LOMALAND STUDENT AND MOTHER

### "Help Nature and Work With Her"

QUEEN ALEXANDRA of England in the retirement of her Norfolkshire home, it is said, revels in the culture of flowers in Alpine gardens, Italian gardens, wild-flower gardens, each inviting with its distinctive attractions.

"One touch of Nature makes the whole world kin," and to hear of their Queen entering into the pursuits of gardening and even the work of a dairy, intelligently and earnestly, has drawn her people yet closer to her. Gardeners as a class know the delights of their work, when it is followed, not as a fad but with real joy in labor and continued interest; they feel instinctively that its great rewards

Nature and work on with her; and Nature will regard thee as one of her creators and make obeisance?"

Queen Alexandra loves roses especially, and in her gardens are hundreds of varieties with a constant succession of blooms. She not only has the joy of gathering her own roses, violets, and primroses to grace her private rooms at Sandringham, but the deeper joy of having wherewith to give pleasure to others.

With the evolution and growth of a nation the ideas of what is befitting the dignity of monarchy also change. We no longer have to be worked into a frenzy of loyalty by magnificent pageants, nor by lavish expenditure of titles and orders, nor are we now to be held in trembling submission by the tyrannous movements of a despotic hand. Royalty may walk abroad unheralded but it is not the less recognized; for we bend the head in reverence before those qualities and refinements that proclaim the true nobility. Has the day of royalty's power passed as some would have us believe? Is the instinct of reverence beginning to die in men's breasts? Are we not rather, hungrily looking around that we may discover those spirits having a stronger moral state and a truer and deeper

power of thought that we may render homage to them and ask to serve under their banner?

A royalty of this new order is already superseding that royalty of pomps and tyrannies whose day is passed. A Queen whose hours are not considered wasted when passed close to Nature must inspire a purer and nobler womanhood throughout the nation, silently urging all women to turn away from the empty voice of flatterers and pleasure-seekers for the joy of honest work. And that work out-of-doors brings an atmosphere of cheerfulness into the life the women of Lomaland can testify. As soon as day breaks, a happy group of young women may here be seen in their garden aprons with spade and fork, barrow and sieve, beginning the day by putting their garden in order. This early morning work together has a magic power. Moods and preoccupations are quickly chased away, our sympathies are quickened and uplifted. The care we bestow on Nature always redounds to our own gain in some unexpected way and before long these workers find there has crept into their hearts a new insight, a new feeling of the Universal Soul; strange sympathies stir within them for all that lives and from their gentle touch flow undreamed-of results.

There are no roses like those that blossom at Lomaland when they are well cultivated, and Queen Alexandra does not love roses more than do the daughters of Loma Hill.

AN ENGLISH STUDENT IN LOMALAND

Lomaland Photo. and Engraving Dept.

THE MANCHESTER (ENGLAND) ROYAL EXCHANGE

should not be the prerogative of any class, and their respect deepens for any who share its pains and pleasures with them. England's beautiful Queen has endeared herself to the people of her adopted land in many ways, by the personal interest she takes in those around her, by her thoughtfulness and general intelligence, and though last not least by her pure, simple tastes and unaffected love of nature.

The pure delight in having everything perfect of its kind befits the queenly rank and it is a delight we all understand. What a picture of a dairy we can imagine a Queen's to be! immaculately clean, with its bowls of thick cream and golden butter unequaled in the land! Then the delights of a garden—who would exchange these for a round of gaities and entertainments? What joy to walk in a wild-flower garden and find clumps of the early primrose growing round its native tree stump, so pure and luxuriant, protected but undisturbed! rockeries designed to give lodgment to the tiny ferns and rock plants—everywhere design, but Nature's setting followed and the chosen plants left to untrammelled growth!

To enter into the spirit of Nature and delight in the growth of all, placing here, adjusting there, working with Nature and continually reaching forward to the producing of a more and more perfect specimen—is it not a joy? The ancients so declared and by their writings we feel that they knew. Do we not read in an ancient and sacred script: "Help

# OUR YOUNG FOLK

ONE OF THE AVENUES OF GÖTEBORG, SWEDEN

## Göteborg

WHEN the city of Göteborg, or Gothenburg, as it is known abroad, was established in the first years of the seventeenth century, most of the settlers were Dutch merchants and farmers. In a few years a mighty trading company was formed, making the new city the center of the foreign trade, as it has been ever since. It was from here the New Sweden in America was planned and established in 1631.

The Swedes preserved something of their original simple life longer into historic times than most of even the kindred Teutonic nations. When they opened their borders to the new cycle of trade and industry, it was foreigners who introduced the new course of life, in return receiving great privileges. Thus the Germans governed the trade along the coast for centuries until their power was broken by Gustaf Vasa, when it threatened to become dangerous to the country. They were succeeded by the Dutch. Even the important iron and copper industries were expanded with the help of skilful miners from Germany and Holland. Many Huguenots came from France, spreading their knowledge and skill among the people.

Later on, when England became the center of the world's market, English influence was dominant and is so still in many ways, because of the close ethnic and trade connexions. The English and Scotch families who settled here in the last century, are numerous.

As Stockholm, the capital of Sweden, is

situated where Lake Mälaren joins the sea, and thus lies as the key of the most ancient region of culture in Sweden proper, so Göteborg, the second city of Sweden, takes the same place in regard to Gothia. The plains between Lakes Venern and Vettern are found to be perhaps the first inhabited in Sweden, and the former lake discharges its water by the river at the mouth of which Göteborg lies.

The entrances to the two cities are protected by numerous islands, though of quite different characters. Those off Stockholm are fertile, and form with their countless summer-houses most smiling scenery. The west coast shows naked, wave-beaten rocks, with a green valley here and there. There is a feeling of simple grandness and majesty prevalent in this landscape, and the light-effects of sun and sea add to this feeling. It is as if a mighty stone wall were placed here to protect the land against the attacks of the ocean. VIDAR

## Knighthood

AS you read of the fair knights — and the foul knights, for Froissart tells of both — it cannot but occur to you that somehow it seems harder to be a good knight nowadays than it was then. This is because we have so many more ways of fighting now than in King Edward the Third's time. A good deal of what is really combat nowadays is not called combat. Many struggles, instead of taking the form of the sword and armor, will present themselves to you after a few years

in the following shapes: the strict payment of debts; the utmost delicacy of national honor; the greatest openness of party discussion, and the most respectful courtesy towards political opponents; the purity of the ballot-box; the sacred and liberal guaranty of all rights to all citizens; the holiness of marriage; the lofty contempt for what is small, knowing, and gossipy; and the like.

Nevertheless the same qualities which made a manful fighter then make one now. To speak the very truth; to perform a promise to the uttermost; to reverence all women; to maintain right and honesty; to help the weak; to treat high and low with courtesy; to be constant to one love; to be fair to a bitter foe; to despise luxury; to preserve simplicity, modesty, and gentleness in heart and bearing: this was in the oath of the young knight who took the stroke upon him in the fourteenth century, and this is still the way to win love and glory in the nineteenth. (From the Introduction to Sidney Lanier's *Boy's Froissart*.)

HOWEVER strange it may well seem, to do one's duty will make any one conceited who only does it sometimes. Those who do it always would as soon think of being conceited about eating their dinner as about doing their duty. What honest boy would pride himself on not picking pockets? A thief who was trying to reform would. To be conceited about doing one's duty is then a sign of how little one does it.—George Macdonald

# THE CHILDREN'S HOUR

## The Two Neighbors

**I**N a place called Child, once lived two old neighbors. Mr. I. Can't had been lame in his legs as long as anyone could remember, and on that account he very seldom went out. Mr. I. Won't was strong and robust and could easily have carried Mr. I. Can't on his shoulders, but he never offered to do it. He had his own reason for this, sly old fox that he was!

Being of a very selfish nature he had never been seen to do a helpful deed, and so he was feared and disliked by everyone. No one would have anything to do with him. "Clever as I am, I can easily fool them," said he, and ran quickly over the bridge called Tongue out through the Mouth gate which stood open.

As soon as he met anyone he started to limp pitifully, telling them that his name was I. Can't. As the real Mr. I. Can't was so seldom seen people were easily fooled and gave Mr. I. Won't what he wanted.

Things went on like this for a long time, and Mr. I. Won't grew rich and fat.

"Too bad to have that old Mr. I. Can't go begging about here all the time," said the people, "but what can we do, lame as he is? It is encouraging though, to see how the selfish brute, Mr. I. Won't, is reforming and staying at home. He must have been touched when we tried to teach him a lesson."

So it happened that one day as Mr. I. Won't limped out as usual, he met a Râja Yoga girl.

"I am Mr. I. Can't! Please have pity on a poor lame man," he drawled out in a miserable voice. How baffled he felt when she looked him right in the face and said:

"I know you! You are Mr. I. Won't. When you come here, use your right name. Now, as a penance for your falsehood, you are to use your strength in doing my bidding. You are to stand on guard at my gate, and whenever anyone comes to call me to do wrong you are to attack them with your club."

"If you behave well you will be given a healing salve; with this you may go to your old neighbor, I. Can't, and cure his lameness, thus paying the wrong that you have done to him. Go to your post!" YLVA

## A Letter from Pinar Del Rio

LA ACADEMIA RÂJA YOGA

Pinar del Rio, Dec. 14, 1907.

Dear Mrs. Tingley:

We hope that you are now safe at Point Loma, and that you will have a very happy Christmas. We are sure the Râja Yoga children are preparing a great welcome for you. We wish we were there to greet you with them.

Let us tell you what we are going to do for the poor children in this city. Some of the girls are making dresses for poor children, and every child in the school will bring something. Some will bring their toys. The day before Christmas the children will bring food, and on Christmas Eve we shall send these things to many poor people. Our friend

## WRITTEN IN MARCH

William Wordsworth

**T**HE cock is crowing,  
The stream is flowing,  
The small birds twitter,  
The lake doth glitter,  
The green field sleeps in the sun;  
The oldest and the youngest  
Are at work with the strongest;  
The cattle are grazing,  
Their heads never raising;  
They are forty feeding like one!  
Like an army defeated  
The snow hath retreated,  
And now doth fare ill  
On the top of the bare hill;  
The Ploughboy is whooping—anon—anon:  
There's joy on the mountains;  
There's life in the fountains;  
Small clouds are sailing,  
Blue sky prevailing;  
The rain is over and gone.

Sr. Rodríguez Acosta has given us the names of some poor people who have nothing, but work hard. We hope these poor people will receive something more than food and clothing, and that we can make them feel some of the joy of Râja Yoga.

The little children have written a letter to Santa Claus inviting him to come here this year to distribute some of the things that we have made for our parents, but they have not yet received an answer and so we do not know if he will come or not. As Santa Claus is so big and as when he comes he will bring probably his two sons, the little children have invited him to the patio instead of the house.

We wish to see you soon, and we hope you will come to us with the New Year. We hope you are quite well now, and that the New Year will be the happiest of all for you and Râja Yoga.

THE GIRLS' LEAGUE

## Old Cap. Dinsmore

**"O**LD Cap. Dinsmore" was one of the heroes of the pioneer days of beautiful Santa Barbara. How old he was or where he was born I never learned, but he must have been well advanced in years when we first met, for he already had the saving of several lives to his credit.

The first time I saw him he came bounding into our yard, with all the school children behind him, wagging his bushy tail and barking a hearty welcome to me, his new neighbor; for Americans were few in those early days in California.

On Saturday afternoons all the neighbors for miles around gathered at the sea shore to bathe. Cap. was always there and at the head of the life-saving service. Many were the venturesome children or exhausted men or women whom Cap. pulled out of the surf.

But the bravest of his deeds was saving his master from the clutches of a grizzly bear. Mr. Dinsmore was well-nigh torn to pieces when Cap. pulled the bear off. Then Mr. Dinsmore saved Cap. The battle raged furiously, but finally the bear was killed, and Cap. lived to be the guardian of the children for many years.

Though he has been dead some thirty years or more, few names of those pioneer days have been so loved and respected, or recall more tender memories than his; for he always thought first of the children and last of himself.

"Old Cap. Dinsmore," you see, was old Col. Dinsmore's great Newfoundland dog. T.

## A Swedish Tale

**T**HREE peasants went to dig in a mountain for a treasure which was reported to be buried there. The mountain sprites tried by threats and in all kinds of ways to frighten them away; but the peasants knew that as long as they showed no fear the sprites were powerless to harm them. So they dug away without heeding the sprites. At last the sprites, by enchantments, caused a scaffold to be erected, and suddenly cried out: "Let us hang the man with the red shirt first."

The peasant who wore the red shirt, for a moment was thrown off guard, and forgetting his companions and all save the threatened danger to himself, took to his heels and ran as fast as ever he could go, which act so frightened his companions that they ran after him. The sprites had won the victory because one man succumbed to fear. OLGA

A LADY in New York has invented a bird piano. It is for use in teaching canaries to sing, instead of a flute or whistle. Music boxes are often used for this purpose also, but as they play the tunes too rapidly for the birds to keep up with them, this lady who loves music and loves birds as well, has invented a tiny piano in which the tones are made by little hammers striking on silver wires. Of course the tunes have to be played very often before a canary can learn to sing. P. R.

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis

Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

## Evolution

THE word "Evolution" is rather hard to define satisfactorily; it is used in different senses. Its etymological sense is the manifesting or unfolding of something that has previously existed in germ. It is used in modern philosophy to mean the principle that all living forms in the universe are successive links in a scale of derivation from the simplest primal forms. The doctrine is as old as thought. Beginning from the close of the Seventeenth century in Europe, several lines of investigation converged into more or less definite ideas as to the application of this principle to biology; and in the Nineteenth century, Wallace, Darwin, and other allied thinkers, crystallized these ideas into what is known as the modern doctrine of evolution.

The word Evolution may be considered as (1) concerned merely with a description of facts observed in the chain of life, or (2) as suggesting theories as to the process by which evolution, or development, takes place.

## The Greatness of Evolution According to Theosophy

In considering the attitude of Theosophy towards Evolution, we have to be very careful as to the meaning of the word; for while Theosophy may admit the principle, it can not endorse all that may be put forward under the name. H. P. Blavatsky says:

We have one thing in common with the Darwinian school: it is the law of gradual and extremely slow evolution, embracing many million years.

Yet it should be pointed out that there are differences which are radical between Darwinian evolutionism and the Theosophic teaching of progressive unfoldment.

The re-announcement of Evolution last century, so far as it implied a recognition that all life proceeds by orderly and intelligent law, was a great emancipation from the shackles of narrow theological thought. But it brought with it many ideas calculated to fetter thought in other ways. The purely biological aspect of the question claimed disproportionate attention, to the exclusion of other aspects which would have given a more balanced and comprehensive view. Again, the scientists were too hasty in constructing their theories on the basis of (relatively) a few facts, thus making the theories too narrow, and then trying to force other facts to accommodate themselves to these too narrow theories.

## Universal Theories on Scanty Data

The attempt to give a complete explanation by physical science alone will therefore be

abortive and lead to errors. To give a complete explanation of the processes by which development proceeds would require that we should extend our science to planes of nature beyond the physical. This is a complicated subject, but some hints have been given by H. P. Blavatsky and W. Q. Judge, who explain that the astral models which enter the physical forms are modified in the astral stage of existence which precedes the physical.

The doctrine of Evolution is so great and important a truth that if mixed up with the very limited ideas of physical science, it is likely to cause equally great and important errors. And when it is considered that science

## Evolution Must Have a Purpose

knows merely the most external phenomena of nature — those which are perceptible to the physical senses — and is in the dark about what lies beyond, it will be easy to see that the chances of mistake are great. We see germs springing up into life and evolving into complex organisms, but we do not see where they come from. That great invisible substratum of nature, from which all life so mysteriously wells up, is an unknown country for modern science. Yet the mental and psychic life of animals, and indeed of other organisms, must be at least as important as the merely physical life.

Theosophy teaches that every organism is the instrument of a soul which is passing through its evolution, gradually acquiring more powers and learning to manifest more of the attributes of the One Life of which it is a spark. Hence it inculcates the duties which man has towards all creation, in helping on its progress, and in recognizing that every living soul is destined to mount upwards in the scale of evolution.

## A Harmony of Balanced Forces

The evolution of Man is a very complex process; and its complete study requires the study, not only of his physical evolution, but of his psychic evolution, and of his mental evolution, and of his spiritual evolution. Man is the converging point of a number of distinct lines of evolution, not the culmination of a single line.

As the tendency of a thing which has a growing spirit in it is to pass on to higher forms, so the tendency of a thing in which the life-spirit is fading out is to degenerate. So the question for Man is whether he will allow himself to degenerate or whether he will pass on. If he is to leave himself to the animal forces of his lower nature, it may well be that, in his next incarnation, he will find himself encumbered by a grosser form (though

not an animal form—the idea that a man can ever become an animal being a superstition). But Man should remember that in him are manifest, not only the animal forces, but the higher potencies of mind and will; and that his duty is to promote evolution and growth in himself and all with which he comes in contact. His aim is to render the physical a fit instrument and home of the spiritual.

We regard too much the outer garb of nature and forget the more real life within. We need to study more the minds of men and animals and the intelligence that underlies all nature. T.

## The Pro and Con of South American Progress

A VIVID account, by Mr. Alfred Sears, in the *Popular Science Monthly*, of the progress of the South and Central American Republics, a progress exemplified by the recent Arbitration Treaty into which five of them have entered, pictures the forces *pro* and *con* as practically Masonry and Clericalism. He says:

Masonry is making great strides in all the republics since the establishment of the new Kingdom of Italy, which has been a lesson in method to the advocates of liberty of opinion, who have learned its value in freeing them from the espionage of those who mold and bind the shackles of thought. Its adherents are everywhere the advocates of the separation of church and state. Visible progress towards this desirable end is slow, but as sure as the irresistible march of time.

Then taking the case of Peru as exemplifying what is going on with more or less speed in all the other states, he tells a story which gives a better view of the two forces at work than any amount of other description:

Probably the story of the priest, Francisco Pablo de Vigil, D.D. of Lima, is the most conspicuous illustration of the condition of life in its relation to the features here treated that can be presented in one single biography. This distinguished theologian, scholar and statesman, was excommunicated from his church because he refused to accept the dogma of papal infallibility. Notwithstanding his expulsion, he continued to wear the ecclesiastical garb and the tonsure and to attend the functions of the church, occupying a seat among the laity. He had warm friends and sympathizers among the lower clergy, but could not receive absolution after confession, since he refused to renounce his error. The national government, recognizing his purity of character, his high degree of scholarship and devotion to liberty of thought, placed him in charge of the national museum, which is a great educational institution of Lima, and brought him into close intellectual contact with the students of the university, so that in this position he had the largest field he had ever yet possessed for influencing the growing mind of the nation. While occupying this station, he died. His death and funeral were as full of interest to the world of thought as his life had been. A personal friend in the priesthood attended him in the last hour and received his confession, but had been expressly forbidden to give him absolution, unless he renounced his error. His confessor relates that he was weeping as he knelt by the bedside of his dying friend, who laid his hand tenderly upon his head and said, "Don't weep for me dear brother, but for the archbishop, whom you but obey; I am going before a greater judge than he." The body was refused admission to the church of La Merced for the ordinary requiem mass, and the clergy also refused the certificate required for

burial in the "Panteón general," which, while "consecrated," is the property of the municipality. This body, immediately, by municipal ordinance, authorized the interment of the body of Dr. Vigil within its consecrated grounds. When the body was brought from the house to be laid in the hearse awaiting its reception, a body of students stepped forward and took it upon their shoulders, bearing it reverently to the chapel of the cemetery.

But now, another surprise awaited the wondering public. As the funeral cortège moved along the streets of the city, processions of Free Masons in full regalia poured from the side streets and followed the train. On reaching the chapel, Masons took charge and conducted the burial service, in the name of human liberty; and in the chapel, which had been consecrated by the church, but was owned by the municipality. The same Order conducted the ceremonies at the grave, with the solemn earnestness of men who understood the act to be a declaration of independence against ecclesiastical tyranny. The higher clergy beheld the act with fear and indignation, while the priests smiled solemnly to see their bishop defied in his own capital. None of them had dreamed that a Masonic Lodge existed in their midst; today the handsomest, best built, and most modern structure in the commercial city of Callao is the Masonic Temple.

Since then the city of Tacna, capital of a southern department of Perú, has erected a fine marble monument to the memory of Dr. Pablo Francisco De Vigil, who was a native son of that town.

This entire episode, in its defiance of the clergy, illustrates the longing for liberty in the better classes of Latin America. But, in all these republics, there is more liberty of conscience than is allowed by the written law which, often angrily cited by the clergy, finds itself in such antagonism to the higher law of the popular conscience, that the courts of ultimate authority manage to fail of finding it in the statute books, written as it is under the unwritten decrees of an advancing civilization.

Clericalism is in fact waning swiftly, knows it, and does what is possible, to get its own worst features a little out of sight:

The clerical apprehension of approaching danger is shown in various attempts to hide or destroy ancient insignia of idolatrous superstition; thus, witness on the façade of the church of La Merced in Lima, the capital of Perú, there existed up to a few years ago the following inscription upon a fillet over the grand portal, *Indulgencia, plenaria, cuotidiana, perpetua, por los vivos y los difuntos*. [Indulgence, plenary, daily, perpetual, for both living and dead.]

Once the people placed the church first, the state after. Now the order is reversed:

A half-century ago, the priest in blessing the national troops in Costa Rica walked over the abased national flag to sprinkle it and the troops with holy water. Today the flag is laid reverently upon a table and the priest walks round it in the performance of the ceremony.

The writer says:

It is contact with the Saxon world, that is stimulating the Latin factor of it to shake off the yoke of that ecclesiasticism which has debauched and, in every moral, intellectual, and spiritual sense, degraded the masses to be the scum of the world's populations. C.

## A Prayer Translated

THE historical old lady who wanted no revised version of the Bible "because the vigorous Saxon of King David was good enough for her," probably never heard of the "little white seal" which it is said

the worthy Laplander is compelled to substitute for the "Lamb" of God, if he would obtain any approach to an understanding of the New Testament which the missionary brings him.

And yet such a translation into the vernacular idea does give a shock to the iron-bound literal translation of the Hebrew Scriptures which obtained so largely but a generation or two ago. And the fact that it was possible to "revise" the Bible made a breach in the infallibility of the letter that has never ceased widening. Finally, no doubt, the Christian world will find no great difficulty in foregoing the obvious errors and forgeries which abound in the translated volume, and will take a broader view of the oriental imagery and style than western dogmatism has been willing to allow.

The effect of translation is bound to be destructive, and a further translation from the version will not fail to show a falling away from the original idea which makes one wonder just what is the difference of idea as to the Christian religion between the various nations of the world from Samoa to Alaska, from India to Peru.

A little study of such a second-remove translation is afforded by a glance at the "Lord's Prayer" in Chinook, the Indian hybrid trade language of the Pacific Coast from California to Alaska, the *lingua franca* of perhaps a million people. A more free translation is quite approximate to the English version, but one wonders if the latter would seem as strange to one of the old writers of the Greek, or to one of the old Hebrew members of the early church?

WHERE reigns the true impulse to meditation, not merely to think such or another thought, there also is progress. Many men of learning are without this impulse. They have learned to reason and conclude, as a shoemaker makes shoes, never reaching the parent idea, never troubling to find the root of thoughts. Nevertheless there is no other way to safety. With many this impulse only lasts a certain time. It lessens, often with the passing years, often also with the invention of a system which they have only sought in order to place themselves above the trouble of meditation.—*Novalis* (translation)

## Some Views on XXth Century Problems

### An Agnostic's Search

SUPPOSE a man took a lantern to look for a sound or studied Euclid in order to see whether he was warranted in believing that he loved his mother? No sound is discovered and even the forty-seventh proposition fails to give him the warrant of which he is in search. He therefore concludes that there may quite possibly be no sound and no love, but that he will nevertheless perhaps be justified in living as though he *had* heard one and still felt the other.

In a recent work Professor Earl Barnes, writing from an agnostic standpoint, inquires what warrant there may be for a spiritual conception of the universe and man. Is man an ego or only a stream of states of feeling? Is there God? Is there immortality? Is there even an external universe at all?

Beginning with the first question, we find, says the Professor, that "the self eludes us. We can find sensations and then more sensations, until, like Hume, we are driven to declare that the stream of consciousness is all that exists."

Another professor, pragmatist and psychologist, has also declared his inability to find, *by the methods of natural history*, any central self, distinct from the stream of his consciousness. He forgot to ask himself who it was, or what it was, that was examining the "stream." He stood on the shore, examined the flowing water, naturally failed to see himself disporting therein, and then decided that himself did not exist.

Is there a universe apart from our perceptions of it? The question is illegitimate because it cannot be made to have any meaning; and it is unscientific. It is unscientific because science knows now that every atom in the universe is bonded to every other by various force relationships—for instance, attracts every other. Some atoms—for example those of the furniture of my room and of the scenery out of the window—very vividly appeal to me; some—for example those that compose Sirius—very faintly. But every atom in the whole universe makes *some* appeal to me, is a minute—however minute—element in the inextricable complex of sensation. I only recognize, and think of, the few sensations or feelings that are relatively strong and that specially appeal to one of the five senses. But the keyboard of sensation has more than five keys, though we have no name as yet for the others. Some people, for example, become aware of it when a strong magnet is brought into the room. We stand therefore linked by sensation to the whole universe, though we only sort out from the complex, five of its strands and only the very vivid ones among them.

Our consciousness, in fact, extends to the boundaries of the universe, and there is no "outside." A better way of saying the same thing would be that the whole universe is a consciousness, or a whole of consciousnesses, able to make, and making, appeal to our consciousness *because of community of nature*.

The appeal is faint, and unrecognized, or vivid.

And as we do not *recognize* the whole in its extent, no more do we in its intent. Molecules, when massed, awake the sensation of touch. But they are also self-luminous and sonorous and a thousand other things for which we have no name because they have never yet awakened enough sensation for *recognition*. And even a molecule has its own special secret of being, a secret that is one because we do not *consciously* take it, not because it is not given.

The Professor concludes that a reasonable faith is the best we can manage about these things, about God and immortality:

There may be no universe to fit my modes of thinking and feeling; but beliefs that accord with those modes are for me necessary and respectable. And if one will go further and admit that this is a sane and orderly universe then there seems increased reason for believing in realities that fit the most persistent longings and beliefs of humanity.

God and selfhood and immortality cannot be physically proved, but they can become subjective certainties for those who do not depend solely upon lanterns and Euclids and test-tubes in their search. The path into nature, to God and to immortality, is found by search of one's own inner being, of the diviner selfhood. It must first be followed inward to the center of our own being, beyond sensation and even beyond thought. Full self-recognition is the beginning of real life and the end of perplexities. We have to transcend the cultivated arrogance of our own minds, which claim that what they do not know is not knowable. They must not preside but *record*.

STUDENT

### The Hidden Element

A LONDON suburb has put up a stone memorial to a dog that was gradually vivisected to death in a London hospital, the process of killing it occupying several months. A number of operators took part and perhaps so many cooks spoiled the privacy of the broth.

The case has excited unusual attention owing to the necessity of protecting the monument against gangs of irate medical students who feel that one of the sacred rights of their profession is in danger.

It is this fact that should stimulate the public to a little thinking. In two or three years they, their wives and their little children will be the patients of those same students, by that time qualified practitioners and already advocates of vivisection.

There is an element in human nature which is wholly undealt with in current psychology, the element of blood-lust, torture-lust. Those who go to see prize-fights and bull-fights are under its sway, though they may think they go merely to see skill and "science." No such self-excuse was possible for those who used to go and see public executions. The infernal element was covered by no rag of respectable excuse. The people wanted to see death.

That this element, whilst *in*, is not exactly a *part* of human nature, is shown by the fact that at the same moment the onlookers gloated over the execution and were horrified. It inspires some of the worst crimes of torture and mutilation, the criminal being often revolted by his crime while he commits it. England has just been wondering at a case of prolonged and purposeless cruelty to some children, the criminal here being a woman. The thing of which we speak had come to occupy the whole field of her consciousness, altogether ousting her better elements.

When that happens in an extreme degree, nothing whatever that can be called human being left, phenomena like "Jack the Ripper" result. When it happens as one phase of an oscillation, we have a case of Jekyll and Hyde.

Itself essentially irrational, it is capable of co-operating with something higher. Those who attend a bull-fight, for example, do also enjoy the scenic display and the swift skill of the toreadors. The vivisector also gratifies his love of knowledge and his ambition. He may not be aware that anything else is active as his motor. But in however slight a degree he has opened a channel between this thing and his mind, and it may be relied upon to press that channel into wider and wider patency. As it does so, ever pressing, to that extent the higher nature must go. It may have to go entirely, leaving nothing but ambition and curiosity to represent the departed humanity of the man. The work of some vivisectors shows that they have reached this point.

That may not be true, probably was not true, of any of the operators on the unhappy dog; still less of the students who tried to destroy the memorial. But the impulse to vivisection always has the cordial backing of the blood elemental; it is always present, pressing for more. The anti-human element has been let into consciousness.

Do we want such a consciousness by the bedside of the sick? Do we not want more than anything else that the consciousness of the physician should be of the highest order, incapable of the slightest prompting from below? And this, not only on general grounds, but because it is from the higher nature that come those flashes of genius and intuition which may mean the salvation of an apparently hopeless case of sickness.

It is also the higher nature which radiates the something that renders the mere presence of some doctors curative. They may only know that they wish well to the patient, but in such men this wish is power.

No such feats are possible to the vivisector. His consciousness has been blunted; the more delicate operations of intuition are impossible; he can but *reason*. And if his practice of vivisection has gone very far he will *experiment* upon his patient in the sole interests of knowledge—and may go lower yet.

This is but a fragment of the case against vivisection. But it may prove of more immediate weight than the many others. STUDENT

## Ancient Culture of West Gothland

THE following article by Professor Montelius, an archaeologist recognized all over Europe for his researches in the finding of traces of ancient northern culture in southern Europe, and especially in Italy, will be of peculiar interest to students of Theosophy, from the fact that West Gothland borders the beautiful Lake Vättern, in which lies the island of Visingsö, where Katherine Tingley, the Leader and Official Head of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, has recently purchased a large property, on which she will build a Branch of the Rāja Yoga School, for the education of children on the same lines as are being carried out at the Rāja Yoga Academy at Point Loma, California.

This spot is truly one of the world's beauty spots. It lies like a gem in the setting of the mystic waters of the lake, and the whole water-girt hill is one great garden with all its different kinds of trees and flowers. Near Katherine Tingley's property is the Royal Forest with its stately avenues. The picturesque cottages shelter a people who have retained in their seclusion much of the simple dignity and hospitality of olden times.

But it is for its historic interest that the spot is chiefly remarkable, especially from its connexion with the work now about to be initiated there. When we first hear of Visingsö in history, at the end of the Viking period, it is in the hands of the royal families who took possession of the throne in the 11th century. In the days of Gustaf Adolf it was owned by Earl Per Brahe, the most illustrious man in Sweden next to Axel Oxenstierna. Here he had his favorite retreat and palace of Visingsborg; and it was here that he carried out his plans in a school remarkable for its aims and constitution. Music was one of the principal subjects in this school, and it was the only school in Sweden to admit girls as pupils. In his last will the Earl entrusts it, in case of troubles arising, to the protection of the king that it may be maintained in perpetuity.

Soon after the Earl's death, however, the island was confiscated by the government; and, though the school was left undisturbed, it sank into insignificance. A hundred years ago it was dissolved by the Diet and its property divided between two other schools. From the quiescence of two hundred years it now re-emerges to fulfil the purpose for which its founder designed it.

The shores of Lake Vättern also whisper of the memory of Saint Birgitta, who in the 14th century established a new order of reformed religion which exerted great influence for long after.

Fuller details about Visingsö and its

### ANCIENT SCANDINAVIAN BUCKLE

From MELHEIM, NORWAY. BERGEN MUSEUM

history will be found in recent numbers of the CENTURY PATH, about the beginning of the present volume. STUDENT

(From *Göteborgs Handels- och Sjöfarts-Tidning*, Jan. 27, 1908)

IN a recent lecture, Professor Montelius, leader of archaeological research in Sweden, touched on the valuable gold treasures found a year ago in the province of West Gothland. This province forms the west coast of Lake Vättern in the immediate neighborhood of Visingsö. He made evident how

the origin of these treasures could be traced to the fourth century A.D. They were probably brought to this place from Constantinople, whither crowds of the northern people went seeking adventure and compelled the Eastern Emperor to give them rich treasures. According to discoveries so far made, West Gothland had already 3000 years ago a culture quite equal to, and in some cases much surpassing, that of contemporary civilized countries. There must have been active communication between the countries of southern Europe and the north at that time. Abundant discoveries of treasure show how the line of communication extended through the Danube lands and followed the course of the river Elbe up to the Baltic. The southern traders seem to have brought amber with them on their return, since specimens chemically identical with that found on the Danish coast have been found in graves in southern Germany and in Italy during the last 2000 years.

There are many proofs that West Gothland had the most ancient culture of Sweden. On its plains gems have been found, with ornaments which are imitations of those common in Italy about 700 B.C. Gradually the style developed and acquired a unique character more full of harmony and taste than even our own time, with its academies of art, can show.

As to professional skill, West Gothland held the highest place in the whole world. During more than thirty years of work in this department, the speaker had visited all the antiquarian museums of Europe and found many proofs of the skill of past generations; but nothing of all this could be compared with the wonderful artistic gems and battle-axes which, after a rest of nearly 3000 years in Swedish soil, have been brought forth and gathered into the National Museum. There they are now kept as proof of our forefathers' taste and yearning for beauty long before the cultural impulses from the Orient had reached our distant country.

### Dinosaurs in Africa

A GERMAN professor has discovered the remains of fossil dinosaurs of gigantic size in a lime stratum eight days' journey from Lindi in German East Africa. This is described as the first palaeontological discovery of the kind on the African continent. T.

### Mammoth Hide found in Alaska

SAMPLES of the hair, wool and hide of a mammoth have been received by the American Museum of Natural History. They are from Elephant Point, Alaska, a fertile spot for such finds. In the St. Petersburg museum there is a complete specimen of a mammoth found cased in ice in Siberia. E.

## The Soul of Matter

**D**R. T. W. MITCHELL has been making some close observations upon the faculty of time perception and time calculation possessed by the subconscious mind. How perfect is this faculty we all know by the familiar use of it in waking at any determined moment. But it also acts during the day, and we could use it then too if we could stop the clatter of the other mind sufficiently to hear the faint note beneath. The subconscious mind is really an extraordinary mathematician and is the performer of the calculating feats of the mathematical prodigies, who, naturally, do not know whence they get the solutions whose rapidity excites the wonder of the bystander.

This same subconscious mind knows a great many curious things. It knows the points of the compass and by it the experienced woodman instinctively orients himself. It knows what the weather tomorrow—and perhaps much further ahead than that—will be. It knows the portending of earthquakes, though it could not tell you what an earthquake is. It is in fact the mind by which animals—though some of these have also the beginnings of intellect—plants, and even molecules and electrons live. And because he also has it man ought to be able to know all that these other beings know—even Baron Nowack's amazing earthquake plant, that knows about sunspots.

It is also the seat of our moods, blueness, crossness, joviality and the like. And it is profoundly susceptible to music. It is the listener to all that our lips say, remembers all that it hears, and re-echoes our words to us along with their emotional color when perhaps we would fain have forgotten them forever.

And as, at bedtime, we can impose on this subconscious mind our command as to the hour at which it shall awake, so we can impose upon it the mood in which it shall awake and which it shall preserve through the day. It is as attentive to our silence as to our speech; and if, at bedtime, we fill some moments of silence with spiritual aspiration, it will faithfully do its best to attune itself thereto and, if so directed, to keep up that effort through the next day. STUDENT

## Singing Sands

**A**N extremely interesting paper on "singing sands" was recently read before the Physical Society of London. As everybody knows, it is not all sands that sing; and nobody seems yet to know exactly why some sands, or most sands, do not. The essential condition of the song seems to be that the sand shall be perfectly clean, shall contain no particle of sound-deadening mud or dust to smooth the friction. The sand granules must be hard clean quartz crystals, and they may apparently be angular or round. If they are not clean enough to sing they may often, perhaps always, be made so by boiling in hydrochloric acid and washing in

water. When they sing at all, the slightest movement is enough to awaken their song, which is very musical. A handful in a teacup will do for the experiment.

The scientific explanation is a little complicated, for the sound is not considered to be due to simple friction of the grains against each other. A quantity of this sand, say a teacupful, shaken, tends by reason of the smoothness of the particles and especially if they are round, to settle into the least volume. But owing to the shake they pass *through* that state of least volume, and beyond it. Then they oscillate back into it again and beyond, to the other side as it were. Expansion, and contraction back to least volume, oscillate, alternate, very rapidly. It is the rapidity of this that gives the note and the phenomenon is comparable to the oscillation of a stretched string. It throws the molecules of the air into corresponding oscillation and we hear the sound.

The phenomena of singing stones, occasionally found, may perhaps have the same explanation—expansion and contraction, or oscillation to and from a norm of some kind. The necessary may be assumed to be absolute perfection of crystallization, homogeneity.

STUDENT

## Reincarnating Chemistry

**W**E are back into the past in another chemical matter. Ancient Hindû chemistry claimed that we have none of the elements before us in their pure state. Each was a mixture composed in part, and mainly, of itself; but in part also of several others, dashes, as it were, of impurity. There were several stages downward from the pure primary "great" Elements; in each stage downward there was more mixing; at the stage of the elements we see, the maximum of it.

Hints of the truth of this are accumulating. It is now known of some elements, and suspected of all, that besides what might be called their keynote, subsidiary notes may be heard. That for example nitrogen consists of nitrogen pure and of some "meta"-nitrogens almost, but not quite, identical in chemical behavior.

Spectroscopy shows the same thing. In the spectrum of iron obtained by the electric arc there are more than 2000 lines, showing an extraordinary complexity of molecular structure. In the spectrum of the same metal obtained by the lower heat of flame these lines are much fewer, but there are some not in the arc spectrum, called "enhanced lines." To explain these Professor Lockyer assumes that the atoms of all elements consist of a mixture of a number of sub-elements and that the "enhanced lines" alone stand for the pure metal. This pure nucleus he calls the proto element. To demonstrate the mixtures of elements taught in the ancient chemistry it will be necessary to separate the "enhanced" or pure lines of each metal, and then see whether some of the others (when we are sure we have them all) may not be the same for a number of different metals. STUDENT

## Another Elixir

**A**NOTED French biologist has thought out another elixir of life, one that sounds promising and is at any rate not disgusting. He expounded his views to an immense audience at the Sorbonne the other day.

He takes the modern view that we die of self-poisoning. The cells become at last overwhelmed by the products of their own activity, of fermenting food in the intestine, and of bacilli therein.

The first of these should be nearly harmless, should be readily soluble, and should be removed by the blood as quickly as they are formed. But the cells are weak and unhealthy, form products that are not very soluble, and retain them. The blood is thick, does not properly bathe the cells, and does not properly dissolve the excretory poisons.

The proposed remedy is sea-water, the fluid in which organic life on earth began. Diluted to the proper point it becomes a friendly wash to the blood and cells, containing nearly every saline matter that is wanted. It causes no swelling of the cells, as, in great quantities, would water, merely washing them of matters which they are over-laboring to get rid of.

The results seem to be very good, and Paris is having a mild sensation over them. One only wonders why the fluid must be *injected* into the blood stream, why it would not be equally effective to take the properly diluted water in increasing doses by the stomach? Taken when that organ is empty, the blood would be almost as quickly reached.

STUDENT

## The Third Eye

**W**HERE did the Chinese learn about the third reptilian eye which they occasionally put between the two others in the great dragons which they parade on New Year's day and other festivities? The ordinary eyes are in their ordinary places and are more or less successful imitations; the third one is a mirror placed between and a little behind. Sometimes an electric light is made to shine through a hole in it; sometimes it is kept in oscillation.

There *was* a third or pineal eye in some reptiles of the past. The ichthyosaurus for example had one. No animal uses one now; for ages it has been buried deep in the skull. But it once functioned; even in man it is represented by the pineal gland and some accessory remnants. And according to Theosophy man once had its full use.

Is that Chinese monster that meanders through our streets on festive occasions a traditional reminiscence of the days of the great reptiles? Science to the contrary notwithstanding, man was their contemporary; human history is continuous and a continuous tradition is possible. That there were dragons as well as giants "in those days," and that the dragons had three eyes, might have been handed on like some other very active memories not yet recognized as such. STUDENT

## Nature

## Studies

**La Grande Dune, Arcachon**

THE accompanying illustration shows a typical scene in the beautiful pine forests of the South of France. These magnificent pines are a splendid memorial to the man whose genius and perseverance were the means of saving from ruin and desolation a very large part of the Landes, as this part of the country is called, by the planting of these trees under almost insuperable difficulties.

The following, translated from the French, shows that, in spite of general indifference, Brémontier and his work were not entirely without sympathy and appreciation:

The shores of the southwest of France, from the mouth of the river Gironde to the Pyrenees, are covered with hills of sand which the waves and tides continually bring to the coast. These hills, or dunes, when moved by the winds, which blow with violence in this desolate region, find an outlet upon the land, where they destroy everything before them, if there be nothing to check their course.

Village spires, villages, towns even have disappeared—buried for ever under the sands; and it was foreseen about a hundred years ago that Bordeaux also would ultimately meet such a fate.

However, the clever engineer, Brémontier, resolved to save the menaced regions. Alone, without protection, without help, he made long and ruinous experiments to forest with maritime pines those sands, until then sterile. The experiments of Brémontier were received with the greatest indifference, but after they were successively repeated during long years, they eventually met with success in spite of the obstinacy of his detractors.

It is interesting to note that the town of Arcachon, which is about forty miles from Bordeaux, owes its continued existence to the work of this man. The church there was at one time buried in the sands, and its recovery and renovation were due largely to the efforts of Brémontier in checking the inroads of the invader.

flat country will fail to recognize that plains also have their charm, which one feels must be dear to our Dutch brothers. T.

**Underground Realms in Canada**

A REMARKABLE series of underground caves and waterways, discovered in 1904 in the Selkirk Mountains, Canada, near Glacier House on the Canadian Pacific

Lomaland Photo. and Engraving Dept.

**WATERFALL ON THE GEUL, PROVINCE OF LIMBURG, HOLLAND**

Railway, has now been explored, and five or six thousand feet of passages mapped. No traces of men or animals were found: the tunnels were often narrow and the floors and roofs jagged, opening however every now and then into chambers of weird and fantastic attractions, to which the usual names of Art Gallery, Bridal Chamber, and so forth, have been applied. The rock is marble or partially marbleized limestone. H.

**A New National Redwood Grove**

A FOREST Service report states that a private owner has deeded to the United States 295 acres of primeval redwood forest on the southern slope of Mount Tamalpais, about six miles from San Francisco. The gift was approved by Chief Forester Pinchot and the cañon becomes by proclamation a national monument.

This grove is one of the only tracts of redwood forest to be found in the natural state in California today. The cañons of Tamalpais draining into San Francisco Bay were cut clean years ago and the wood used for building old San Francisco. But this cañon has its outlet on the ocean side and has been saved.

The tract will be named "Muir Woods," after John Muir the naturalist; and will be kept both for scientific interest and for recreation. The largest trees are 18 feet in diameter at the butt and will approach 300 feet in height, rising with perfectly straight and clean stems. Their age must be from 1000 to 1500 years. Besides the redwood, there are Douglas fir and all the various hardwoods common to the region, including oaks, madrone, alder, maple and mountain laurel. May many other private owners of timber lands imitate this example. T.

**Spiritual Blindness**

THERE are certain burrowing animals—the mole, for instance, which have taken to spending their lives beneath the surface of the ground. And Nature has taken her revenge upon them in a thoroughly natural way—she has closed up their eyes. If they mean to live in darkness, she argues, eyes are obviously a superfluous function. . . . And in exactly the same way the spiritual eye must die and lose its power by purely natural law if the soul choose to walk in darkness rather than in light.—Henry Drummond

Students'

Path

## THE SAGES' WAY

AT times I almost dream  
I too have spent a life the Sages' way,  
And tread once more familiar paths. Perchance  
I perished in an arrogant self-reliance  
An age ago; and in that act, a prayer  
For one more chance went up so earnest, so  
Instinct with better light let in by Death,  
That life was blotted out—not so completely  
But scattered wrecks enough of it remain,  
Dim memories; as now, when seems once more  
The grail in sight again.

—From Browning's *Paracelsus*

## Morality a Theosophical Necessity

NO one, whose moral sense has not been blunted, could fail to see, even in glancing through the Theosophical text books, that a moral basis is a necessity in a Theosophical education.

H. P. Blavatsky, the Founder of the Society which is now known as the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, and her co-worker and colleague William Q. Judge, were untiring in their constant and repeated teaching on this point; and Katherine Tingley, their successor, makes it a necessity for her students.

That the Theosophical moral code was also the same as that of all the great Teachers from Krishna to Christ, from the Laws of Manu and the Ten Commandments to the tribal laws of the Australian aborigines, is indisputable, as is clearly demonstrated by a study of comparative religion, except that the Theosophical moral code is the most far-reaching and the highest of all, being the source and foundation of all.

There is also a remarkable identity in the chivalrous moral teaching of the Europeans, the Japanese, and the Maoris, peoples widely separated and unknown to each other for ages, as far as their traditions and public records show, yet one and all having the same *moral teaching*! How is this? Surely this must point to a natural Divine moral law inherently the property of all well constituted human beings, and not a class-made arbitrary code at all! The very principles of Theosophy insist that this is so; and that man is and must be shut off from his higher Divine nature, unless he sincerely carries out the moral law, and it is only through the practice of the highest morality that our human nature and the vehicles of human consciousness may be so clarified as to permit the light of the Spiritual nature to illumine the mind and brain.

One of the Great Teachers of Theosophy said: "Behold the Truth before you: a clean life, an open mind, a pure heart, an eager intellect . . ." and then enumerated various other requirements, and said: "these are the golden stairs up the steps of which the learner may climb to the Temple of Divine Wisdom."

Mark the first step is a *moral one, a clean life*.

There is also a teaching well known to all Theosophical students, given to them by H. P. Blavatsky, from the *Book of Golden Precepts*; "To live to benefit mankind is the first step. To practise the six glorious virtues is the second:"

1. *Charity and love immortal*: or universal Brotherhood, the law which Buddha, Jesus, and Confucius put first also.

2. *Harmony in word and deed*: or practise what you preach. Honesty and sincerity.

3. *Patience*: teaching self-restraint, etc.

4. *Indifference to pain or pleasure in the pursuit of Truth*.

5. *Courage and dauntless energy that fights its way to the Supernal Truth*.

6. *Concentration or contemplation on the Higher Self*.

If you think over these, and especially seek to practise them, you will find that to carry them out requires the constant practice of the highest morality in all the circumstances of our lives. And Theosophy teaches that not until there is the honest endeavor to make the highest moral law the rule and guide of our life can the first touch of the Divine nature, hence Divine Wisdom, Theosophy, be felt or perceived. This will receive the unqualified support and testimony of thousands of genuine Theosophical students of the present and the past. For the fundamental proposition of Theosophy is: that by living in harmony with the Divine natural laws of life we can become conscious of our own Divinity and so attain the divine wisdom, or the Truth; and this is being demonstrated by the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY.

This discovery or recovery of the knowledge of the *actual divinity* of Man, is the greatest triumph of the age; for it is the key to all our difficulties, individual and social.

T. W. WILLANS

## Simplicity

PERHAPS really to appreciate simplicity we need to be simple ourselves. Simple in the real sense, I mean, "frank," "sincere," for it would be only then that "absence of artificial ornamentation" would appeal to us. Simplicity, in the Theosophical sense does not mean absence of beauty, art, or refinement. On the contrary, true simplicity needs all these things. Theosophy teaches that one of the powers of the soul is to discriminate, to see things as they really are, and this is essential to true simplicity.

Children are simple, when they have not been spoiled, and how apt they are at times at going straight towards the truth, without thought of conventionalities, or expediences! How often a world of woe would be saved by simplicity; and what an aid to acting promptly without the thousand and one *pros* and *cons* of our complex mentality—the soul acting before the brain-mind has had time to protest.

Who has not at times felt the benefit of, say, simple obedience, faith, or trust, in times of difficulty, and if pride were sometimes less, we should feel it more. Simplicity means attention to duty, doing the thing in hand, "with all thy might," for the reason that the simple

person puts his heart interest into what he is doing and so does his best.

Then too there is a simplicity about true genius, and finally it is one of the marks of a noble and unselfish character. Simplicity sees "the great in the small and the small in the great"; it deals with principles and not merely with effects, and it has been said that to be a student of Theosophy, simplicity is essential, "the pupil must regain the child state he has lost." He must be content to work for humanity regardless of place or power for himself, work for the love of duty and to carry out the higher law of his being. The simple truths of Theosophy show this to be the only way to fulfil our high destiny, to attain perfection and become as the gods.

Consider the main teachings of Theosophy. How simple they are! Unity, immortality, the dual nature of man, Reincarnation, Karma, Universal Brotherhood, are all so simple in the great sweep of universal application. And the student who lives his life simply, trustingly, and obediently, in accord with the great laws of all Life, learns to control the evil and bring forth the good, avoiding the dark abyss of broken law with its sad penalties.

Simplicity, too, is the magic power that brings us in touch with many of the inner beauties of Nature, that otherwise would remain hidden. In a word it is in its true sense an open doorway through which we may glimpse our Divinity.

STUDENT

## FRIENDS IN COUNSEL

DR. Emil Reich is of opinion that "Englishmen are incapable of friendship," but as he kindly explains his ideal friend as "a man who has an irresistible desire to see you frequently, to talk with you, and to take a personal interest in you and yours," the Englishman may perhaps reply. "Is thy servant a dog that he should do this thing?" And it may be a matter of some satisfaction to that people to know that this caustic critic has not been able to find an Englishman willing to pay him the homage of such canine devotion.

Such egotism is incompatible with true friendship, which is the dawn of altruism, that self-forgetfulness which lies far beyond the reach of the selfish seeker for sympathy, and indeed beyond the reach of the one who merely practises self-sacrifice. This latter quality in itself implies a consciousness of selfishness that needs to be sacrificed and can have no place in true friendship, which breaks through the barriers of personal selfishness and merges two hearts in one.

Altruism is the perfection of human evolution, wherein each individual feels and knows its unity with all others. Friendship is but one step in this evolution, and the man who still craves for the devotion of admirers and adorers, is as yet unable to give the friendship that he seeks. That plant cannot be grown by one who has not the seed. STUDENT

BUT the man who only taketh delight in the Self within, is satisfied with that and content with that alone, hath no selfish interest in action. . . . He whose heart is not attached to objects of sense finds pleasure within himself, and, through devotion, united with the Supreme, enjoys imperishable bliss.—*Gita*

## TRUTH

**O** BRAVE poets, keep back nothing,  
Nor mix falsehood with the whole.  
Look up godward! Speak the truth in  
Worthy song from earnest soul!  
Hold, in high poetic duty  
Truest Truth, the fairest beauty.

—Mrs. Browning

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

## Question

You say Theosophy and the teachings of Christ are identical, yet the latter during two thousand years have not regenerated the world. How will Theosophy do any better?

## Answer

Identical? Yes, in a sense. Christ taught nothing but Theosophy, and perhaps he taught the whole of Theosophy to his immediate disciples, but what has come down to us is merely fragmentary, and pure and beautiful as it is, it is not enough to meet the needs of humanity today.

Suppose you had a man in from the streets, showed him a complicated machine, and told him to produce the finished article, whatever it might be, and left him. If he were no mechanic, had no knowledge of machinery, would a description of the thing to be made be very useful to him? Would he understand it? No, you would first have to teach him the principles involved and show him how to work. Otherwise he would be checkmated at the start; he would not even know how to get to work or, in trying, might so disarrange the machine as to make it useless until the master mechanic had restored it to order.

What were those "Mysteries of the Kingdom" to which Jesus referred, but of which we find no trace in the Gospels? Jesus had gathered about him a body of men whom he proposed to train to be teachers and helpers for humanity. We cannot doubt that he taught them how to understand and work the human machine—it was given to them to "know the mysteries"; but to the multitude he only spoke in parables or gave the clear ethics of the Sermon on the Mount. Supposing that Sermon were the only religious teaching we had, how many men and women are there capable of forming their lives on it? All can try, and succeed up to a point, in loving their enemies, doing good to them that hate them etc. but is the one command, once given, enough to help the ordinary man, weak-willed and beset by passions, right through to that perfection which Jesus held up as the goal of our endeavor, perfection "even as the Father is perfect"? What is to be the motive force for our striving? Why bother about it at all? To save one's soul? Ah, here is the point. The soul is too problematical with some, and there are others wise enough in their ignorance to know that their own salvation is not worth losing sleep over. Out of so many millions, they say, what will it matter if a few, themselves, are lost? What doctrine is there to help these people, to show them where their mistake lies? They are right so far as a selfish motive is never worth following, yet of course in the result they are hideously wrong.

With no more truth than what has come down to us of Jesus' teachings, and interpreted as it is in most churches, it is possible to make self-salvation the goal of religion;

no better motive is defined. But Theosophy taught by H. P. Blavatsky, William Q. Judge, and Katherine Tingley, shows that this is one of the broad roads that lead to destruction. "To live to benefit mankind is the first step," and all the inner life of aspiration must have altruism for its end. To reverse this, and cultivate a kind of imitation brotherhood for your own soul's good, or as a means to the religious life, is fatuous or even suicidal. And Theosophy shows that a pure life must be lived because an impure life harms humanity—and these things are not mere dogmas; the reasons for them are quite clearly shown.

And then, should there not have been some new help, some new knowledge ready for the man who had done his best with what he had? Jesus gave his disciples such knowledge and prepared them to give it out, as far as he was able; but where is it now? Where has it been all these ages?

Think of the history of Theosophy in our time, note the attacks from within and without that have broken on it, and marvel that Theosophy still lives and triumphs. The tares grew up with the wheat, and shouted to the world that they were the only grain in the harvest. Was there no plot there? No attempt to kill altruism and the living power, and foist on the world instead, hypnotism, astral garbage, nominalism, and the rest? But the plots failed because there was a William Q. Judge to succeed H. P. Blavatsky, and a Katherine Tingley to succeed Mr. Judge. But in ten million ages perhaps this has not happened before. Where you have humanity you have all the possibilities of godhood, but you have also this demoniacal power which plots and plans the destruction of every attempt to put forward the Grand Unravelment of our human problems.

Jesus chose twelve men, as the story says, to train them so that after his passing, they might be to the world lights as great as he was. He had only three years or so for this work, and seven years has been spoken of as the minimum time. Then one of them was found ready to deny him thrice, another to betray him; but who was there fitted to take the Master's place and *protect the work with full knowledge*?

So little by little the Mysteries of the Kingdom were suppressed by the believers in no moral code of the time, and if the beautiful ethics remained, they remained overlaid with a thousand misleading dogmas. What but plots and the working of malice could have covered up the teaching of man's divinity and perfectibility, and flourished in the public gaze the doctrine of original sin in its stead? Nourished it, too, as the hypnotist makes his passes, until Christendom came to be marked by carelessness and hopelessness of ever getting beyond the morasses of sin.

Now and again a man tries to live according to the Sermon on the Mount; but having no knowledge of his own nature he fails again and again. Even with the best knowledge one is likely to fail until, after much fighting, that knowledge has been made practical. He fails, and for lack of any further teaching of the right sort, becomes discouraged. If he goes to theology, in place of the nourishment he asks for, he will receive the stone, the serpent, the scorpion of original sin; no call to his

manhood, but only an appeal to fear and despair. Not that we must be understood as attacking the churches; it is merely that the true and living teaching disappeared ages ago, and imitations are not substitutes for it.

Theosophy on the other hand, does more than send the man to the machine of which he is entirely ignorant and bid him produce the priceless fabric of the perfect life. Theosophy does show us how to work this terribly complicated thing, our human nature, a million times more delicate and difficult to control than any engine ever invented. It throws light on the subtle play of the motives that move us to evil unawares; shows us how to take the current of them at its source, depolarize it, and set it to accomplish other ends. Not that it is claimed that all this can be gained through no more effort than is implied in the reading of books, but it is claimed that Theosophy points the way to the study of our human nature; indicates how we may trace out the intricacies of self, divine and animal; how to foster the higher and curb the lower; how to recognize and work with Universal Law. For Theosophy does represent those lost Mysteries of the Kingdom, and as it is assimilated it extends more and more help. The ten cities are always ready for the man who has made his one talent into ten, or, in other words, whoso doeth the will, does come more and more to know of the doctrine. STUDENT

## Reincarnation

**N**O other doctrine has exerted so extensive, controlling, and permanent an influence upon mankind as that of the metempsychosis [Reincarnation]—the notion that when the soul leaves the body it is born anew in another body; its rank, character, circumstances, and experience in each successive existence depending on its qualities, deeds, and attainments in its preceding lives.

"Such a theory well matured, bore unre-sisted sway through the great Eastern World long before Moses slept in his little ark of bulrushes on the shore of the Egyptian river. Alexander the Great gazed with amazement on the self-immolation by fire to which it inspired the Gymnosophists; Caesar found its tenets propagated among the Gauls beyond the Rubicon; and at this hour it reigns despotic, as the learned and traveled Professor of Sanskrit at Oxford tells us, 'without any sign of decrepitude or decay, over the Burman, Chinese, Tartar, Tibetan, and Indian nations, including at least six hundred and fifty millions of mankind.'

"There is abundant evidence to prove that this scheme of thought prevailed at a very early period among the Egyptians, all classes and sects of the Hindûs, the Persian disciples of the Magi, and the Druids, and, in a later age, among the Greeks and Romans as represented by Musaeus, Pythagoras, Plato, Plotinus, Macrobius, Ovid, and many others.

"It was generally adopted by the Jews from the time of the Babylonian captivity. Traces of it have been discovered among the ancient Scythians, the African tribes, some of the Pacific Islanders, and various aboriginal nations both of North and of South America."—Rev. William R. Alger, in *Critical History of the Doctrine of a Future Life*.

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## Some Assorted Clerical Opinions About Christianity Church Has No Monopoly Upon Religion

A BAPTIST minister is reported as preaching that:

I do not believe that the Church has any monopoly upon religion. . . . It is becoming more and more apparent that the fate of Christianity is in no way bound up with the fortune of any or of every church. God has other servants, and if one proves unfaithful the work will be committed to another. . . . But I believe the mission of the Church has not yet been fulfilled; her greatest work has only begun.

### MORE THEOLOGY NEEDED

A University professor says that theology has been too much neglected. Feeling and action have crowded out of the foreground the function of thought; piety and efficiency seem substitutes for intellectual power; the passion for service has supplanted the passion for truth. The Church must either:—

frankly retreat from the pretense of leadership under the conditions of the present age, or it must become a more efficient organ of rational and candid thought.

### BIBLE STORIES "MERE FLUBDUB"

#### CHRISTIANITY BASED ON PERSONALITY OF CHRIST

A pastor who is described as having passed through a nine-day soul experience that stirred him to the very depths, believes that the present-day church is dying, choked to death by old forms and church systems; that real Christianity is being born again; and that it will be founded not upon a book but upon a personality. The real Christianity is founded upon the personality of Christ, he says—what Christ said and did. The living church is not founded upon a book; the Bible is by no means the solid truth from cover to cover.

Most of the Old Testament, he says, is little more than traditions and folk-lore, permeated with a thoroughly religious spirit and very valuable and helpful at the present day, but subject to the possibilities of error that all folk-lore is liable to. Daniel in the lion's den, the opening of the Red Sea, etc. are all "mere flubdub." The prophets of old sought the best means of conveying religion to the minds of people then living; but they are not adapted to the minds of today. And so during the

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

Reformation, many of the dogmas were made by men for men then living. The present church system is a heritage from a past age. It is clearly dying; but that does not mean that Christianity is dying.

### BIBLE IS THE GREAT STAND-BY

At the meeting of a club for religious discussion, the principal speaker said that Biblical literature is the most hopeful in the world. The Bible is a book for everyone to read. The optimism of the Bible is eternal. Heaven and earth shall pass away, but the eternal words of hope shall not pass away. After all, that is the secret of the enduring power of the Bible.

### BIBLE NEEDS RE-EDITING

A University professor says that the Bible of the future will contain all the sacred books that have been eliminated from it by ancient critical processes, and these books will be restored to their places in the canonical scriptures. The Bible of the future, moreover, will have to be constantly translated, owing to continued study of the text, and the discovery of new texts.

### THE ONLY GOD IS THE GOD IN MAN

A preacher who became well known through having been turned out of his church on account of his beliefs, but who was much respected by his congregation, and whose expulsion is now admitted to have been a great mistake, says that God is the sum of the forces in the universe, and in order to have the help of God we must first know him as he reveals himself in these forces. He ridiculed the idea that a select few souls were to compensate God for his failure in the creation of man; and said that we were now beginning to see that in every part of the universe there is enough of the divine to save it. The only God we had to depend on was the God working through our own intelligence. STUDENT

## Wishes

THE wish to *become* is reasonable in direct ratio to its largeness,—or, in other words, the more you wish to be, the wiser you are; while the wish to *have* is apt to be foolish in proportion to its largeness. Cosmic law permits us very few of the countless things that we wish to have, but will help us to

become all that we can possibly wish to be. Finite, and in so much feeble, is the wish to have: but infinite in puissance is the wish to become; and every mortal wish to become must eventually find satisfaction. By wanting to be, the monad makes of itself the elephant, the eagle, or the man. By wanting to be, the man should become a god.

Probably everything is a mere question of wishing—providing that we wish, not to have, but to be. Most of the sorrow of life certainly exists because of the wrong kind of wishing and because of the contemptible pettiness of the wishes. Even to wish for the absolute lordship and possession of the entire earth were a pitifully small and vulgar wish. We must learn to nourish very much bigger wishes than that!

Nay!—surely the time must come when we shall desire to be all that is, all that ever has been known,—the past and the present and the future in one,—all feeling, striving, thinking, joying, sorrowing,—and everywhere the Part,—and everywhere the Whole. And before us, with the waxing of the wish, perpetually the Infinities shall widen.—*Lafcadio Hearn*

YES, my friend, I too look at the sunset glory; I too let my sense go forth and dissolve in that ocean of liquid and changeable color. But whilst sight is thus occupied, I myself go in to Myself. And thus, when the sun has gone down and the west wind blows chilly across the fields, I have gained something that does not pass away as passes away the memory of the colors. They may serve us as music may serve,—to still the marketplace whilst we steal a moment for the inner shrine.—*Colbert*

HE who would profit by the wisdom of the universal mind, has to reach it through the whole of humanity without distinction of race, complexion, religion or social status.—*H. P. B.*

# The Theosophical Forum in Isis Theater

S a n D i e g o C a l i f o r n i a

## LAST SUNDAY AT ISIS THEATER

SPACE lacks this week to give a full report of the meeting at Isis Theater, San Diego, last Sunday evening, when a large audience gathered to hear Mr. A. G. Frisbie, of Cleveland, Ohio, speak on "Some Errors of Christian Science."

Mr. Frisbie, who was formerly a prominent member of the Christian Science organization, having held several official positions in that body, sustained the interest of his discourse by apparently impersonal and unprejudiced statements. The audience manifested great interest throughout. Mr. Frisbie carried much power in his address and received hearty applause. It is understood that the address will be printed for public circulation.

Some specially good musical numbers were rendered by the Point Loma orchestra.

OBSERVER

## Inauguration of New Activity at Katherine Tingley's Beautiful Isis Theater, San Diego, California

SELDOM has the Isis Theater, San Diego, looked more attractive than it did on Tuesday, February 25, when the curtain rose upon some of the most elaborate and effective stage settings that have ever been shown even in a Metropolitan house. They were beautifully relieved by a tasteful arrangement of flowers and green foliage, on either side and in front of the proscenium, sent from Lomaland. A highly appreciative audience, composed of the most cultured and refined citizens, filled the theater, the action of the play went with the greatest smoothness and brilliancy from start to finish, and in every way the inauguration of this new effort for the benefit of San Diego was started under the most favorable auspices.

The Isis Theater has been leased to Mr. Edmund Gardiner for the production of the highest class of comedy and drama, and, to judge by the keynote struck in the choice and presentation of his first play, and the warm reception given by the public, there can be no doubt of success. At the end of the second act the performers were called before the curtain and flowers were presented. Mr. Gardiner was called upon for a speech and he expressed in a few heartfelt sentences his pleasure at the favorable reception accorded.

Mr. Gardiner, the lessee, has no connexion with the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, but he shows in his methods of carrying out his ideals of dramatic work a most cheerful disposition to try to meet the demands of Mrs. Tingley in conducting this work at the Isis Theater.

Although the rapidly increasing activities of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY and the extension of its work in new countries demand the time and attention of the students at Point Loma more

than ever, the members of the Isis League of Music and Drama will occupy the Theater from time to time to present the special dramatic works whose interpretation is part of Katherine Tingley's public educational work in spreading the principles of Theosophy. The new and original plays in Katherine Tingley's possession will some day also be produced at the Isis Theater.

The moral of the play chosen by Mr. Gardiner for his *début* was quite in harmony with the Theosophical teachings. As the struggle between honor and wounded pride on the part of the heroine became clearly defined, the duality of human nature, a basic Theosophical principle, was effectively pictured; and the secondary plot touches upon the true position of woman in the world, and shows in comic relief the absurd and degrading effects that ensue from the efforts made by extremists to step out of the rightful sphere of woman's life in search of imaginary "rights."

Before the curtain rose there was an agreeable surprise for the audience in the shape of an address, written by Katherine Tingley, upon the inauguration of this new dramatic work under her auspices. This was read with the most perfect intonation by one of the Cuban Râja Yoga girls; it is given in full below. The Point Loma Theater Orchestra played the opening piece, and the remainder of the music was given by Mr. Gardiner's Orchestra which rendered some excellent selections.

Mrs. Tingley has leased the Isis Theater only for weekdays for dramatic purposes. On Sundays, the free public meetings on Theosophical subjects, which have been held by the students from Point Loma for over seven years, will continue as usual.

The following report is taken from the San Diego Union of February 26. OBSERVER

### Society Audience Witnesses Initial Performance of Gardiner Stock Company

"AN excellent representation of *The Case of Rebellious Susan*, a mild satire on conjugal life, by Henry Arthur Jones, was given by the Gardiner stock company at the opening of the Isis Theater last night. The play was surpassingly well staged and the acting of a high grade.

"The story deals with the matrimonial misadventures of Sir James Harribin and Lady Susan Harribin. Sir James has been indiscreet enough to carry on a love affair, news of which has reached Lady Harribin. She determines to pay him back in his own coin, and carries on a flirtation with a young man in Cairo. It is the part of Sir Richard Kato to reconcile husband and wife.

"As Sir Richard Kato, H. R. Roberts achieved a pronounced success. Mr. Roberts has the ease of a finished actor. It is distinctly a pleasure to see him carry out his part, so sympathetic is he in his interpretation of the character he represents. He strikes no

false notes, for his words and acts are always those of the character whom he is impersonating.

"Miss Eleanor Montell took the part of Lady Susan. She pleased the audience last night by her beauty and grace. . . .

"The comic element was introduced into the play by the sad love story of Ferguson Pybus and Elaine Shrimpton. The lady belongs to the class known in England as suffragettes. Pybus is an insipid admirer of the fair suffragette. Only marriage can bring about his disenchantment which, when it comes, is complete.

"Carlton Chase as Ferguson kept the audience in very good humor. His success was unqualified.

"Miss Virginia Berry made an excellent suffragette. Her part was probably better received by the audience than that of any of the rest of the company, with the exception of Mr. Roberts.

"Miss Marion Tiffany had the part of a sweet widow. She played this so well that she succeeded in captivating her audience as completely as she did the heart of Sir Richard Kato.

"Mr. Franklyn Hurleigh's makeup as an English admiral was especially good.

"The other members of the cast gave good support to the leaders.

"The audience was composed of the leading people of San Diego. Conspicuous among those present was Mrs. Katherine Tingley, Leader of the Point Loma Theosophists. She occupied one of the lower boxes on the left side of her theater, and took great interest in the play. She applauded vigorously at times and especially when any reference was made as to woman's proper sphere being her own home. The following address of Mrs. Tingley was read by one of the Point Loma students:

"Ladies and Gentlemen:

"Out of the large number of applicants for the leasing of the Isis Theater presented to me, many of them fairly desirable, I favored Edmund Gardiner with a lease most stringent in character, which exacts from him and the attachés of the theater, as well as the members of the Gardiner stock company, a conscientious support on their part to sustain the dignity of Isis Theater, that it may continue in its work as an educative factor of morality and helpfulness to all who enter its doors.

"The spirit with which Mr. Gardiner responded to my demands and his endeavor to co-operate with me in trying to accentuate the highest moral standards here has caused me to find it a pleasure to speak in his behalf tonight and to accentuate my appreciation of his good taste in the selection of a play on the opening night which carries in its construction the atmosphere of sweet morals. *The Case of Rebellious Susan*, although not writ-

ten by a Theosophist, touches the margin, in parts, of an educative force that points to the fact that happiness in the home depends upon woman realizing the dignity of her calling as a wife, as a mother and as a homemaker.

"The contrasts pictured in this play, so free from that vulgar touch that we often find identified with theatrical work, are most wholesome.

"In conclusion I here repeat what I have said before in this theater, that true drama points the way from the unrealities to the real life of the soul. As such the drama should lead and guide the public taste, providing it with ideals to which it can aspire. It is good to find in this capricious age refreshing signs of Mr. Gardiner's work — of a first step being made that if rightly followed must lead to redemptive work in theatrical efforts. In this connexion may we not assure Mr. Gardiner that if he follows out this course begun here tonight he may depend not only upon your hearty support, but the support of all the citizens of San Diego?" — *San Diego Union*.

### Scientific Spook-Hunting

THE distinguished scientific gentlemen who are members of the Psychical Research Society seem sooner or later to reach a spiritualistic basis for phenomena otherwise inexplicable.

Seriously speaking, however, has the world received any real enlightenment on esoteric phenomena since this society was organized?

The above sentences are from a newspaper paragraph. This paragraph mentions the latest pronouncements of a certain often mentioned scientific gentleman who has done good work in his own domain, but who, whether voluntarily or involuntarily, seems of late to have assumed the rôle of prophet upon questions outside that domain.

Scientific gentlemen have a certain reputation for being "hardheaded" — a reputation which it is not necessary to begrudge them — and for accuracy of observation and unliability to be deceived. Hence, when they put down their test-tubes and occupy their leisure in writing creeds and catechisms, defining the origin, nature, and destiny of man, and his duty here on earth, they are looked up to with as much confidence as a renowned actress when she recommends a new kind of soap. Nevertheless one detects a certain subtle humor and flippancy in the remarks which the press makes upon them. This one, for instance, after talking about this particular case, ends up with "seriously however."

We understand that the scientific gentleman in question has become convinced that he receives messages from a member of the Psychical Research Society, now deceased; and his ideas on the subject are represented by the following weighty words:

On the question of the life hereafter, the excavators are engaged in boring a tunnel from opposite ends. Amid the roar of the waters and the other noises [the gentleman is evidently a poet as well] we are beginning to hear the strokes of the pick-axes of our comrades on the other side.

What a picture! No wonder Theosophy is asked to make way for science, the leader of the vanguard of human thought in this culminating era of the ages! The eminent scientist at one end, and the renowned F. P. R. S. at the other, tunneling the veil!

It is interesting to speculate as to where the F. P. R. S. is. Clearly he is not in heaven; but wherever he is, he seems anxious to get away from there! And what a glorious prospect for the eminent scientist, when he dies; to be promoted from bottom sawyer to top sawyer, or *vice versa*, as the case may be. He will be able to join the F. P. R. S. at the other end of the diggings. And when they meet in the middle, what joy there will be!

"Seriously, however," does not this kind of thing bring great discredit upon science? To know the mysteries of life and death is hardly given to people of small imaginations, with a solemn lack of the sense of humor and proportion. There comes to mind a sentence from one of Stevenson's novels which seems to apply wonderfully to this case:

Dig away boys! you'll find a few pignuts and I shouldn't wonder!

One would be very much surprised if they found any treasure.

Now what does all this illustrate? It illustrates the fact so often insisted on in Theosophical writings, that when anyone attempts to investigate the occult he soon comes upon a switch (to continue the engineering metaphor). He finds two paths open before him. The one was that emphasized anew by H. P. Blavatsky, and since kept clear by her successors — the path of duty and love of esoteric knowledge for the sake of the power it confers "to bless and serve humanity." The other is that which leads by a sharp curve into the realms of delusion. These two paths have been so clearly defined that no middle course is possible.

If, therefore, anyone wonders why it should be that people should all of a sudden wander into spook-hunting and table-turning, here they have the answer.

But do not these scientific investigators want facts — evidence that can be seen and weighed — instead of theories and dogmas?

Very well, and they will surely get their facts. And they are welcome to them, as the baffled treasure-seekers were welcome to their pignuts.

"But seriously," has the world received any real enlightenment or will it? STUDENT

### On Mental and Other Clocks

"CURIOUS about getting up in the morning," said a man who has to rise early. "I find that I can make my brain serve as an alarm clock if I so will.

"I say to myself, or my other self, or my brain, or however you mind to put it, that I want to wake up at 6 o'clock, and at that hour I wake up, roused by my mental alarm clock, which from the time I set it the night before has kept right on running, steady and true while I slept, to wake me practically if not exactly on the hour.

"But I find that this silent alarm clock is a very sensitive clock, a clock that refuses to do its part of the work unless I do mine. I said that it will wake if I so will; that is to say if I really mean it. But I find that if I don't actually obey the summons when it comes, if I turn over for another five minute nap and sleep maybe half an hour, and I do this a few mornings in succession, why then my mental alarm clock won't work; it appears to resent working for anybody that won't perform his part of the contract faithfully.

"In short, our mental alarm clock appears to be a very delicate piece of machinery which will not

bear any trifling with. Form the habit of responding to it promptly and truly and it will wake you at any hour for which you set it, but disregard it or treat it lightly and it will not call you at all, or with quite proper resentment it will now call so softly as not to be heard.

"But you have to mean it even with a noisy alarm clock of brass and steel; for otherwise it is easily possible for you to sleep right on through even its noisy clamor. Suppose you set this clock for 6 o'clock, when you ought to get up, though you could sleep till 7, as you'd lazily like to do, and still manage to get through.

"If, thus temporizing with duty, you should let yourself sleep over a few mornings you would soon get so that you wouldn't hear the alarm clock at all; it might hang its head off and still you wouldn't hear it.

"On the other hand, if you are resolute in your intention to get up you will sometimes wake up a minute or two or thereabouts before the clock goes off. Here, you see, our mental alarm clock comes in to re-inforce the clock of metallic wheels and springs.

"You may have given no thought whatever to setting it when you did set the metal clock, on which alone you were relying; but if you really willed that you would get up the clock of your brain would very likely set itself, of its own accord, for the same hour, and it would also call you then. Very kind and sympathetic and helpful is the human brain to those who deal fairly with it and treat it right; a truly wonderful thing it is in fact." — *Exch.*

### Italy Lays Claim to the Vatican

Government Regards Itself as Real Owner of Treasures the Palace Contains

Rome, Feb. 1. — The *Corriere della Sera* publishes the astounding fact that the government of Italy regards itself, or the Italian people, as the real owners of the Vatican, including its art treasures, libraries, gold and silver, jewels, antiques, etc.

The principle is laid down in a dispatch sent by the late Premier Crispi to the Italian Ambassador in Berlin, and which has just come to light.

Crispi informs the ambassador that the German government had inquired in Rome what Italy meant to do if the pope should decide to demand entrance fees to the vatican museums. "Report to the German government that this is a matter of interior Italian politics, and that we will not discuss it, except as a matter of information," writes Crispi.

The dispatch continues: "Since the pope is no longer king of Rome, and the Vatican palaces, with all they contain, are now the inviolable property of the Italian nation, the pope has no right whatever to charge admissions to the museums etc., for under the law of guarantees he is but the beneficiary of the Vatican properties, our tenant.

"The establishment of entrance fees to galleries, etc., owned by the Italian nation is equivalent to levying taxes, and in levying taxes the pope, being no longer a sovereign, is assuming rights that do not properly belong to him." — *Omaha World-Herald*, Feb. 2, 1908.

### "They'll Be Tamned and We'll Be Singing"

AN English visitor when out deer-stalking conversed with a ghillie, who belonged to the Free Church, as to the difference between his Church and the Established.

The Englishman said he had attended the services of both Churches, and had heard their ministers talk in private, and could make out no difference at all between the faith and practice of worship between the two. "Och, yes," answered Tonal, "there is a great difference." "What is it? I can't see it." "Och, it's just this: that we'll have grace, and the others will be burned in the everlasting fire. It's just that they'll be tamned and we'll be singing." — *Passages from the Past*, by the Duke of Argyll.

# Art Music Literature and the Drama

## News Letter from a Recent Visitor to Point Loma

THE following interesting article is reprinted from the Editorial Correspondence of a recent issue of the *Musical Courier*, in which the article was accompanied by a large number of illustrations.

THE illustrations in this number of *The Musical Courier* are taken from photographs of actual facts and conditions as they can be met with by the eye in the remarkable habitation in the southern section of the State of California, called Point Loma, near San Diego. This is a peninsula that extends out into the Pacific coast, and at its extreme point is the Point Loma lighthouse. Nearer to the mouth of the bay is Fort Rosecrans, near which is the Rosecrans National Cemetery, where the sailors were buried that were killed at the explosion of the Bennington, which took place in San Diego Bay. Between Fort Rosecrans and the city or the old town of San Diego, on a height overlooking both the ocean and the bay, is a twelve hundred acre settlement, studded with magnificent temples, buildings, schools, homes, and academies. This is the School of Antiquity, conducted by Mrs. Katherine Tingley, who is the Leader and the Head of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY.

A recent visit to this remarkable nucleus of institutions disclosed the fact that in addition to the elemental studies, art, such as painting and sculpture and architecture, the sciences and literature, are studied, as well as music and the drama. As Point Loma is the center of the Organization and the Theosophical Society, the activities of the place are of deep interest to everyone interested in a liberal view of ethical, social, and artistic questions that are now constantly propounded to us in our daily intercourse with humanity.

We notice that in explaining the nature of the term "Râja Yoga," which is the name of one of the schools, the literature states that it implies but the balance of the physical, mental, and moral faculties. The balancing of these faculties is what constitutes the equilibrium of intelligence. Under the broadest interpretation of all religious beliefs, with a liberality of thought that is sometimes amazing, particularly to those whose minds are concentrated in dogmatic theories, the children and pupils and teachers are taught to give an equal option to each and every department of religious belief in its development. There are no prejudices generated; there are no dogmas engendered. The mind is free from any bondage as soon as it can grasp the strength and power which the theories and plans of Point Loma inculcate.

As we are interested in the musical division of the school, it is necessary to state here that a thorough musical education can be gathered at Point Loma. There is an orchestra there. Of course, being a students' orchestra, it is merely in a developing condition, but the best kind of music is played, harmony and counterpoint are taught by men and women who have graduated from the best colleges and schools of music, and, of course, the instrumental task is taken up, with the result that piano, violin, other string instruments and the voice are cultivated. The children also sing in chorals and are trained in their earliest period to seek for the higher and better in music. The effect of these ideas is heard in some excellent results both in classes and in individual tests.

The fundamental theory of work is co-operation on the basis of the development of the individual

mind, free from the overweighing and depressing influence of traditional prejudices and pragmatic dogmas. There is no attempt to proselyte and no effort to influence, but under the beautiful sky of Southern California, with its delightful and even climate, with the magnificent stretch of the Pacific before the eyes of the children and the youth and teachers, some estimate of the grandeur of nature is reached and narrow-minded theories are naturally eradicated through the influence of greatness as exhibited in the profundity and magnificence of nature itself.

The human element is primarily cultivated; not only humanity, but humanity as represented in the

besides all this, a home life, the children being surrounded by all the elements of the fireside. It is, therefore, a most unique institution, which is now of such prominence as to call forth the attention of the educators of this country and of the West particularly. Many families are taking advantage of the opportunities offered to young children to be educated under this amiable plan, and with such an atmosphere to imbue their early youth with a character to fit them for future usefulness. As to the natural climatic conditions, they are the most attractive in that attractive section of the globe. The spot is ideal, the conditions are ideal and the life is ideal. B.

Lomaland Photo. and Engraving Dept.

### A CORNER OF ONE OF THE MUSIC ROOMS, POINT LOMA

individual; not only humanity in wholesale, but humanity in the retail, each single intelligence being approached in such a manner as to give it the greatest freedom of action, and yet under such a reserve of benign thought and generous action as to prevent that action from being sordid or selfish.

Such being the case, it was impossible to overlook this institution, with its primary school and academies, and we therefore state some additional facts regarding its influence. There are now, besides the Point Loma school, two schools at Santiago in Cuba, two in San Diego, two in California besides San Diego—that is, one in Roseville and one in San Francisco. There are also one in Stockholm and several in England. The theory, in addition to what has just been stated, is non-sectarianism, enunciation of language, calisthenic exercises, chorus singing. As Mrs. Tingley says, "Music is not merely one of the arts of life, but a part of life itself," and that is the basis of musical instruction.

In the city of San Diego is the Isis Theater Building, a beautiful modern theater, in which performances take place of the highest dramatic character. This is owned by Mrs. Tingley and the citizens of San Diego receive great benefit from it. There is,

### Mistral, the Poet of Provence

MISTRAL, the poet of Provence, whose *Memoirs* have just been published, has been a true poet because his sole motive in taking up his life-work was the desire to rescue his people and their language from the slurs cast upon them by reason of their rusticity, and also to render Provençal once more a literary language.

He tells how, when he came back from Aix, where he had been admitted to the bar, his father said to him: "Now, my fine fellow, I have done my duty. You know a great deal more than was ever taught me. It is for you to choose your path. I leave you free." In the liberty granted by this wise father he made his resolve. The poem that made him famous was *Mireille*, which took him several years of labor to write. In it he gave free rein to his fancy and was inspired, as he himself believes, by the unwritten legends of romance that brood over the pastoral air of Provence. He has written several volumes of poems since, has compiled a dictionary of the language, and done much to revive the presentation of great popular spectacles in the amphitheatres of Arles, Orange and Nîmes; organized anniversary fêtes in honor of the traditions; and founded at Arles a museum of Provençal antiquities. STUDENT

### Holger Drachmann, the Danish Poet

OF the loved Danish poet, Holger Drachmann, referred to in the preceding issue, a Swedish student adds the following interesting glimpse. The bond uniting all the Scandinavian peoples is a strong one, and none of their great poets is ever thought of as having a message for his own land merely.

Drachmann sang above all of the sunny days in life, of everything that was free, healthy and strong. When his eye, however, fell upon the dark side, his sympathy instantly arose and in fiery words he warned and chastised or anon spoke tenderly, in deepest compassion. When so many voices and tendencies tried to bring about the separation of our Northern countries he stood there as a guardian, protesting, sounding the keynote of brotherhood all through his life. And his voice was listened to. Although a Dane by birth he belonged to the whole North and was a noble representative of the Northern spirit. He died as he lived, a true Viking soul. F.

Love your enemies, do good to them which hate you, bless them that curse you, and pray for them which despitefully use you.—Jesus

### The Times We Live In

**H**OW momentous are the times in which we live! Think of it! We are standing now at the dawn of a new era when things will come to pass that are positively unknown to exist by the average consciousness. Events are in the air that belong to a stratum of thought and feeling long unused by human kind. We have been living a brain-mind life, an animal, emotional life, with only touches of the heart's influence here and there like the bright spots in a very gloomy mosaic; the pattern we have stamped out by thought and word and deed on the fabric of our lives has largely lacked the daintiness, subtle shades of higher thought and feeling, the delicate color scheme of a truly noble, unselfish life.

Ah, what beauty we have shut out of our lives! And now it is coming back again, for the Great World Teacher has come—come with the knowledge and power to show humanity the way life should be lived, and to awake the hearts of all! Pictures true to nature may our lives now become, no longer crude daubs of passion, sensation, anger and greed, but artistic productions, softly lit up by the glorious spiritual rays of the central Sun. "As a single Sun illumine the whole world, even so doth the One Spirit illumine every body." Oh the wonderful times we live in! when the truth is coming back to us in such a vital way—through the heart-touch of the purified soul, the living breathing messenger of Theosophy.

Katherine Tingley, with torch in hand, is relighting the fires of spiritual life in every land where the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY has gained a footing. What hope for the world, what joy! Theosophy to be a living power in the world's general life as it is even now in the lives of thousands here and there.

People only need to know what Theosophy

is to turn to its blessed principles, and Katherine Tingley is teaching them how to find the light. Theosophy was misunderstood in the days of H. P. Blavatsky and William Q. Judge, by the general public; but there are great opportunities for all to learn the truth now; for the children at school in the Aryan Memorial Temple, dedicated to H. P. Blavatsky and William Q. Judge at Point Loma—carrying out under Katherine Tingley's methods of education the great teachings of Theosophy, growing strong in morality, in compas-

### TO ATHENA

**A**ND Athens, O Athena, is thy own!  
Great Goddess, hear! and on my darkened mind  
Pour thy pure light in measure unconfined;  
That sacred light, O all-proceeding Queen,  
Which beams eternal from thy face serene.  
My soul, while wand'ring on the earth, inspire  
With thy own blessed and impulsive fire!

Proklos (Taylor)

sion, in intellect, and in heart—are an unanswerable proof of what Theosophy can do.

And so, in these times in which we live, the pattern of our lives will be set in accord with the true canon of proportion; the *Heart Doctrine* will be lived, and the eternal harmonies of the world-soul "that sweep through our hearts in mighty waves, if we but listen"—will be heeded, and humanity will start the upward ascent that "leads to final liberation."

Such is the message of the Great Helpers, and such is coming to pass through the work of their messenger Katherine Tingley, backed by the devotion of her students, old and young, throughout the world! Let us rejoice together. Let us together move forward as Souls and Comrades with that superb confidence that shall give us the power to level every path, to remove every stumbling-block from out the way of the people. The hour has struck; the call sounded! EMILY I. WILLANS

### Impressions of a New Member at Lomaland

**A**FTER a residence of only a short time at Lomaland, the confusion, unrest and selfishness everywhere existing and apparent in the outside world are brought to one's notice more forcibly than ever before. In contrast with the life on the Hill, it brings home to us the old, old questions as to what man is and what man should be. From the viewpoint of a new member one is first of all impressed and astonished by the singular natural beauty of the place, which seems to have been fitted by nature for the purpose for which it has been selected. Then the astonishment gives place to admiration, as one begins to understand the superbly unselfish work, going on incessantly, of the dwellers on the Hill, work for the advancement of universal brotherhood and the realization of "Peace on earth, goodwill to men."

The unquenchable ardor of the Leader inspires all who have dedicated their lives to the cause of humanity, guides them in the Path of spiritual advancement, and encourages them to strive with unfaltering energy for the betterment of mankind and the uplifting of men's souls towards the beautiful ideals of a Higher Life. The sensible methods of proper living, so seldom met with in the world without, are here seen in daily practice. The beauty of the place, the architecture of the main buildings—all in such perfect harmony with the surroundings—the restfulness that seems to be in the atmosphere of Lomaland, all conduce to an elevation of mind and spirit that marvelously assists the seeker after Truth in his battle for self-conquest.

In the mad rush of the outside world how one misses this softening influence! The majority go on and on in the dull routine of selfish lives, thinking of nothing but the present and their own wants and desires. "Let us eat, drink and be merry, for tomorrow we die,"

is their shibboleth. But signs of a great change are to be seen. There is a rift in the blackness of the cloud. Katherine Tingley has said that the present unrest and confusion in the thinking world is a sign of the awakening of the spiritual faculty, the Christos principle, in the people generally. They have been slumbering for centuries, but Theosophy is awakening them to the knowledge that Divinity is within themselves and pointing out to them the right Path. A few steps taken on this Path by the seekers after Truth, and they will look with different eyes upon all life, all nature, all their fellow men. The time is coming when the glorious truths of the Wisdom Religion will be appreciated and understood by the people at large, when all doubt will be cleared away, and it will be shown to the world what the Higher Life is, how it may be, and must be, lived. And where must we place our hopes for this awakening? Where, but in the lives and teachings of the Students and the children now being educated and trained at Lomaland. Katherine Tingley tells us that her hopes for the future are centered in them. Their lives are the noblest evidence of Theosophy in practice.

They live in an atmosphere of love and sympathy. The happy faces of the older Students, no less than the tiny tots, our "Little Philosophers," portray contentment and self-reliance, and a study of the wonderfully bright minds of even the youngest, their moral excellence, their repose and accomplishments, gives assurance that they will carry on the good work and in their turn become teachers of the beautiful qualities and noble ideals now being inculcated in them, that by the example of their lives they will spread broadcast a knowledge of the essentials of right living. Fortunate are they to receive the message direct from their Teacher, who loves and understands them so well, and is guiding them with a sympathetic hand towards the Light. The Râja Yoga system of education is destined to be a lasting monument to the memory of Katherine Tingley's great service to humanity. When we call to mind that she has done this work hampered by slander and persecution and untold difficulties, we realize the great victories that may be won by her power and wisdom. Great results will be accomplished by these, the Students and "Little Philosophers" of Lomaland. Let their watchword be "Stand Fast!"

STUDENT

### What Will and Work Can Do

**B**ORN in France, but a resident of this country from very early childhood, Miss Christine La Barraque has spent most of her life in California. Deprived of her sight at a very early age by disease, she has made for herself a place among the world's workers which may make those who are blessed with the full possession of their senses ashamed of the way in which they have misused their far superior opportunities.

and was duly admitted to the California bar.

She says that when she entered the University the teachers exclaimed in dismay, "What shall we do with you?" "Do the same as with the others," was her reply. But they assumed that lacking sight, she must lack intelligence, and although she was in the recitation room with her class, at first no questions were asked her. One day some questions were put to the class as a whole, and she answered so understandingly that the teacher was convinced

that she fully understood the subject, and after that she was treated the same as the others.

In addition to her intellectual ability, this young lady has a wonderful voice, has studied music in Boston about three years, was in Italy last year under the instruction of some of the best teachers, and has now returned to Boston where she has made a host of friends.

When the bill for a permanent commission for the blind was before the Massachusetts legislature in 1906, Miss La Barraque spoke at the hearings of the committees having the matter in charge, and there is no question but the impression made by this talented young woman had an important bearing upon the decision.

While in Rome this gifted blind girl attended a convention held in the interests of the blind, with delegates from several nations. So aimless and so hopeless seemed their discussions that Miss La Barraque proceeded to give them some facts regarding the work with and for the blind in England and the United States which would enlighten their mental blindness, and her address succeeded in calling forth many questions. Cheerfully, courageously, helpfully, is Miss La Barraque carrying her share of life's burdens and lending assistance

by her spoken or written word where it will help to lighten the burdens of others. H.

EACH year witnesses new names added to the list of woman lawyers who have been admitted to practise before the Supreme Court. It is about thirty years since this was made possible through the effort of one who sought to extend her practice to the Higher Courts, but was refused admission because the statutes contained no provision for this. She set to work to have the barrier removed and in a short time had brought about the passage of a bill which placed men and women on an equal footing in this respect. H. H.

"PETER'S GALLERY"  
IN THE ST. PETERSBURG ACADEMY OF FINE ARTS

Miss La Barraque was educated in the schools of California, and has always associated with people who had the boon of eyesight. She graduated from the University of California and then desired to take the course in law. Her friends considered this a wild, impractical idea, and declined to assist her in carrying out the plan. Very well — since no assistance was to be given she determined to "put herself through," and, after long and wearisome but persistent effort, with the aid of influential friends, she obtained a position as teacher in an evening school at San Francisco, and thus paid her expenses. She graduated fifth in a class of seventy-five men

# OUR YOUNG FOLK

## THE FORTUNATE ISLES

Joaquin Miller

**Y**OU sail and you seek for the Fortunate Isles,  
The old Greek Isles of the yellow-birds'  
song?

Then steer straight on through the watery miles,  
Straight on, straight on, and you can't go wrong.  
Nay, not to the left; nay, not to the right:

But on, straight on, and the Isles are in sight—  
The Fortunate Isles where the yellow-birds sing  
And life lies girt with a golden ring.

These Fortunate Isles they are not so far,  
They lie within reach of the lowliest door;  
You can see them gleam by the twilight star;  
You can hear them sing by the moon's white  
shore.

Nay, never look back! Those leveled gravestones,  
They were landing steps; they were steps unto  
thrones

Of glory of souls that have sailed before,  
And have set white feet on the fortunate shore,  
And what are the names of the Fortunate Isles?

Why, Duty, and Love, and a large content.  
Lo! these are the Isles of the watery miles,  
That God let down from the firmament.  
Lo! Duty and Love, and true man's trust.  
Your forehead to God and your feet in the dust:  
Lo! Duty, and Love, and a sweet babe's smiles,  
And these, O friend, are the Fortunate Isles.

—Selected

## Tangier

**T**HE first and most vivid impression made by Tangier, on the north coast of Morocco, is that of whiteness; white houses, white walls, white garments, accentuated by the memory of darker touches—slaves, beggars, and prisons. The second impression is that of picturesqueness and variety of the street life and of the habits and customs of the mixed population:

From a distance Tangier has been well described as like a white bird lying on the hillside. The passage from the Bay of Gibraltar or of Algeciras takes from two to four hours. The landing is primitive and not without excitement, for the surf breaks a long way out; steamers anchor beyond it and passengers are rowed to the pier in small boats.

It was a striking scene when I landed on a bright afternoon in January, with a rough sea. A dozen boats, each with three or four natives, all clamoring and shouting. The headman in each, distinguished by a white turban, secured *some* order, by occasionally thumping and knocking down one of his men, for no reason apparent to a European; nor did they mind. All merchandise and cattle are landed on the beach, carried from rowing-boats on several men's shoulders through shallow water, then dropped cleverly on the sand.

From the pier we pass through narrow streets with high white walls and numerous arches, to the hotel, in time to be nearly deafened by the sunset salute of guns from the fort, so-called, adjoining. This recurs at sunrise during the month of Ramadan (of fasting) when Mahomedans neither eat nor

smoke between sunrise or sunset. They take, doubtless, their usual two meals at night, for they are half asleep the next morning.

In the narrow streets many nationalities literally jostle each other. In one long winding thoroughfare a pedestrian flattens his back against a wall or house to allow a loaded mule to pass. This street is cobbled and has a gutter in the center. Europeans and better class Moors ride. The Jews have their own quarter, are compelled to wear dark blue or brown cloth jelabas (cloaks) and are restricted to the use of one gateway.

Similar streets to the above lead up to the Kasbar or citadel. The principal Mosque, with roof and minaret of colored tiles, is in a somewhat open part of the main thoroughfare; also the four post offices and better class shops. Farther up are many quaint odd corners and archways where strange sights present themselves—goat skins drying for Morocco leather, horse-shoeing, and many beggars, sometimes terribly maimed objects having lost a limb or feature according to the crime committed. How cruel and revengeful this is, showing an utter ignorance of brotherly feeling and compassion!

A caravanserai interests one. It is a large open square, walled in, the inn forming one side and entered from the street, the remaining three sides being divided, on the inside, into stalls each partly covered by an arch, leaving the central space for cattle, sheep, camels, grain, etc. with the numerous owners. In another open space are government buildings, curious old arched places with many pillars. There are prisons, courts, and counting-houses, where the white cloaked officials sit

cross-legged on the floor, counting out piles of coin for shipment to Fez. A noisy picturesque stream of people passes along these streets, down to the bay or up to the Soko (market place).

The Soko is outside the city gate, a large piece of ground partly walled. There are some shops, tent-like shanties, where are sold articles generally in use, guns, pipes, shoes, clothing etc. All else arranges itself on the ground; children, women with babies tied on their backs, selling great piles of oranges, palm roots—eaten as food—brushes, curios, etc.

In another part of the Soko, a small crowd is watching a Snake Charmer. He handles his snakes gently and fearlessly and allows them to wind round his limbs and body. Another group sits on the ground in a semi-circle listening to a professional story-teller, a figure full of energy, who partly acts his tale and every now and then fires off a gun. His language is Arabic. Every day and all day these two follow their respective trades and collect pence from those who listen and look.

In an afternoon every one rides or walks along the bay. The Arab is a beautiful figure in white, cantering past on his Arab pony with his long spear poised for action. So is the Algerian mounted soldier, in light blue uniform and mantle. There are country women, wearing huge hats over many folds of muslin. For this is one of the roads leading to Tetuan where many wealthy Moors took refuge in 1492, and still, it is said, have the keys of their houses in Granada, hoping to return.

All this, and much else besides, one can see within a few hours of Europe! F. J. B.

SNAKE CHARMERS, TANGIER, MOROCCO

# THE CHILDREN'S HOUR

## The Messengers of the Gods

THE lovely land of Greece is a kind of peninsula shaped like a mulberry leaf, that seems to float upon the waters of the beautiful blue Aegean Sea. Around its scalloped edges the white waves dance and curl. And fair islands sparkle like jewels on the bosom of the sea, for the golden sun shines bright and warm over the lovely land of Greece, and the air is as clear as a crystal dome. There are mountains and valleys and holy groves, in the lovely land of Greece.

Beautiful cities with white marble gates, and temples and palaces, and statues of ivory and gold, are built on the cliffs overlooking the sea; built by people as beautiful as the gods, for they built them all to honor the gods.

In the midst of the lovely land of Greece towers the high Mount Olympus, the home of the great gods. Here on a throne of ivory and gold sit Jupiter and Juno, the king and queen of the gods. Gorgeous peacocks with spreading tails of sapphire, emerald and topaz stand at Juno's side. When she wishes to visit the earth they draw her shining chariot. In Jupiter's right hand he holds the thunderbolts, in his eyes the lightnings flash, at his feet stands a splendid golden eagle.

The high gods loved the fair race of men that lived in the sunny land of Greece. Sometimes they would descend from high Olympus, stepping from mountain-top to mountain-top, until they reached the sun-bright cities on the cliffs overhanging the sea. But oftener they would send their messengers from cloud-topped Olympus down to earth, to help some mortal whom they loved. The favorite messenger of Jupiter was Mercury. He was a tall youth, lithe and strong, and could run as swiftly as the wind. And why not? For growing from the round cap which he wore on his bright crisp curls, were the wings of a bird. His sandals too had wings, and in his hand he carried a short wand, with two serpents twisted round, and on the end were outspread wings.

Now Juno's favorite messenger was a girl, a maiden slim and tall, and she bore the name of Iris. She wore a robe of gossamer, silvery as the moonbeams. Her wings were white and sparkling like the drops of dew. Her noiseless feet were swift as light. She was so fair that as she flew to earth, bearing the messages of Juno, the great Sun smiled to see her loveliness. Then, swiftly, a shining bow unrolled, that spanned the way from high Olympus to the earth; over this shining arch the maiden tripped or flew. Then seven colors sparkled like jewels on her dew-drop wings, and beneath her airy footsteps flowers of seven colors sprang. Children looking upward

THE MAN FROM JAPAN AND HIS ELEPHANT  
PAYING A VISIT TO ONE OF THE BOY'S BUNGALOWS AT POINT LOMA

## THE RAINBOW

PITTER, patter,  
All day long  
The raindrops sang  
Their pretty song,—  
Till at eve  
The curtains gray,  
Slowly rose  
And sailed away,  
Like white wing'd ships  
Upon the bay.

And as they sailed  
In beauty by,  
The great Sun smiled  
Across the sky.  
And straight way in  
The heavens blue  
Was hung a bow  
Of promise blue,  
With seven colors  
Of shining hue.

Sunbeam fairies  
Well I know  
Dance upon  
That lovely bow,  
Dance and sing  
With raindrops bright,—  
Until the Sun  
By magic might  
To colors turns  
His pure white light.

And a pot  
Of purest gold  
Hidden lies,—  
For so I'm told,  
At the rainbow's  
Shining end.  
Thither now  
My way I'll wend  
And to you  
The prize I'll send!  
—Student

could see sweet red roses, orange marigolds, the golden daffodils, lilies of the valley sheathed in pale green leaves, forget-me-nots blue, fringed gentians of rarest indigo dye, and fragrant violets nodding low. And those who stood in silence there, to watch the maiden Iris pass, could hear a faint sweet song as if the seven colors of the bow were the seven strings of the Sun God's harp. STUDENT

## Two Brown Babies

BEYOND the market place and the Legation residences of Tangier, picture a country lane of loose sand and hedges of aloes or prickly pear. On raised ground, standing somewhat back, a hut, and outside the hut a mound of stone. Sitting on the stone, side by side in the sunshine, two little dark brown children, babies, with black eyes full of surprise. Their bodies are unclothed, even their heads shaved, with the

exception of one small lock of hair—carefully left, because by this each will be drawn up to heaven, so they are taught. They know nothing of life's real meaning or of Râja Yoga, though some day they will hear of the true heaven and how they can find it and how they can make it—*now*—for all who are around them. F. J. B.

## Jumbo at Point Loma

YOU have read about the merry Christmas gathering in Lomaland at which the Man from Japan appeared with his elephant. All the grown-ups and children felt as if they were old friends—this armor-clad Oriental with his huge, intelligent beast; so you can imagine how happy they were to find that these two did not disappear with Santa Claus, but were to be seen about the Academy grounds for several days. If you heard shouts of glee in the distance, you were sure on approaching the place whence came the sounds to find the elephant surrounded by groups of children; and it was very noticeable that the longer he and his keeper stayed, the more they seemed to enjoy getting acquainted with the Râja Yogas. It was a very interesting sight to see these two visitors, duly escorted, wending their way along the drives and garden paths, and stopping at tents and bungalows to exhibit their tricks or give the little folks a ride. One day, *very* suddenly, they disappeared. No one knows where they went, as they were not seen passing through any of the gates! But every one hopes they will return. M. M. S.

HAPPINESS is a great love and much serving.—*Selected*

I WOULD give nothing for that man's religion whose very dog and cat are not the better for it.—*Rowland Hill*

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogenesis  
Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

SECRET DOCTRINE OF THE AGES  
IS THROWN OPEN TO ALL

Postage prepaid - - - - - \$10.00

THE THEOSOPHICAL PUBLISHING CO., Point Loma, Cal.

# ISIS UNVEILED

A MASTER-KEY TO THE  
Mysteries of Ancient and Modern Science  
and Theology

By H. P. BLAVATSKY

2 Vols. Royal 8vo., about 1400 pages, indexed; cloth.  
With portrait of the Author

NEW POINT LOMA EDITION, WITH A PREFACE

by H. T. Edge, B.A. (*Cantab.*) an old student under H. P. Blavatsky and now a member of the Staff of Professors at Point Loma, California.

Vol. I treats of Ancient and Modern Science  
Vol. II treats of Ancient and Modern Religion

The reprint of this invaluable work is in answer to a constant demand, which shows that the book is *alive* and is needed by the liberated spirit of the age.

Postage prepaid - - - - - \$7.00

THE THEOSOPHICAL PUBLISHING CO., Point Loma, Cal.

## The Key to Theosophy

## Ethics, Science and Philosophy of Theosophy

A Clear exposition in the form of  
Question and Answer of the  
Exhaustively Indexed. With a Copious  
Glossary of General Theosophical Terms

by H. P. BLAVATSKY

THE KEY is a remarkable Compendium of Theosophical teaching. It is the book of books for beginners and higher students  
The incessant call for this work has exhausted the earlier editions. NEW POINT LOMA EDITION NOW READY

Cloth, 400 pages, Postage prepaid - - - - - \$2.25

Order from THE THEOSOPHICAL PUBLISHING COMPANY, Point Loma, California, U. S. A.

## "The Catechism a Curiosity"

Practical Christianity and not doctrines was the present order in religion. Under the greatest exponents, the barriers of sectarianism were rotting away. The good ship Zion was no longer an old hulk that never went into dry dock, with barnacles and seaweed on the bottom, lumbering along at the rate of half a mile an hour. . . . All infallible churches were receiving severe jolts today, and were destined to encounter hard times and ecclesiastical panic. Priestcraft was played out and man was thinking for himself. . . . Many time-honored doctrines reminded us of shriveled specimens in alcohol in a medical museum.

Verbal inspiration had given place to higher criticism. We were not now taught that the world was created in six days, and that Mother Eve was a reconstructed rib of Father Adam; and the zoological garden had been substituted for the Garden of Eden as the home of our ancestors. Natural law had invaded the spiritual world, and young men were not now afraid to look the minister in the face and say that hell had cooled off considerably in the last half century.

## Lightening the Ship to the Storm

A young man went to his minister and asked him if he really believed the whale swallowed Jonah. "I don't care whether the whale swallowed Jonah or Jonah swallowed the whale," was the reply, "if you follow the Master."

Our children did not sing, "I want to be an Angel," today; they sang, "If you want to be happy, be good." Ministerial mollycoddles were not as numerous as they were a decade ago. The minister did not rest so comfortably in the vest pocket of some antediluvian deacon who contributed largely to his salary. . . . The people were tired of dullards and dotards in the pulpit. The Church proposed to go into the wholesale salvation business, and to the individual salvation it added social salvation.

The present doctrine was one world at a time; men were taught to live as well as to die. There was no longer an air of other-worldliness about a Christian; the minister did not go around peddling titles to mansions in the skies; the Church was no longer a Noah's Ark containing only the saved or a patent spiritual fire-escape.

## Irreligious Religion

The above reflects a prominent phase of modern religious thought. It is a transition phase. Mixed up with much sane thought as to the absurdity of old dogmas is much confusion as to the new ideas that are to replace them.

The clergyman mentions, as exponents of the Church today, the names of some well known liberal churchmen. But what is actually the position of these liberal ministers? As we have so often seen, they have cut away so much standing ground from under the Church that among them all, it has virtually no standing ground left on which it may stand and continue to call itself the Christian Church. They profess an attitude so broad that it entitles — nay, compels — them to quit the exclusive fold of Christianity and enter the broad expanse of Universal Religion; yet they fear to relinquish their position as ministers of a special revelation and a local religion. Their attitude is inconsistent; they are "on the fence"; they keep their balance only by confining themselves to generalities and forbearing to follow up the logical sequence of their avowals.

## The "Balance" of a Spinning Top

The present clergyman, however, does mention one or two things that he thinks may replace, or have replaced, the old dogmas. He says the zoological garden has been substituted for the Garden of Eden as the home of our ancestors. To show the confusion of his ideas, it is only necessary to point out the inconsistency of such a notion with the ideal of social salvation which he urges. Granting, for the purpose of the argument, that man is descended from the zoological garden, so far as his body and its immediate appurtenances are concerned (and Theosophy has much to say about that teaching) still it is obvious that we cannot look to the wild beast show for the origin of those aspirations which are to work his social salvation. At least we must look beyond the beasts for the origin of that Divine impulse to progress and perfection which is supposed to have been transmitted through them to man, or (if not that) which man has obtained from some other source. Therefore, what has this modern scientific doctrine to do with the question at all?

## Apotheosis of the Animal

The modern doctrine of evolution contains a good deal of truth, mixed up with a great deal of error; as can only be expected when a law of such far-reaching scope is faintly glimpsed by the representatives of a very circumscribed school of thought, and by them applied to the elucidation of their own very limited and peculiar views about nature and man. The great Law of Evolution does indeed necessitate a revision of theological dogmas — but not in favor of other dogmas, scientific dogmas, as preposterous as, and perchance even more evanescent than, the

theological ones. Evolution, rightly understood, can but ennoble all it touches; and the origin of man and the manifestation of worlds only becomes clear and luminous by its aid.

The idea of social salvation as superseding personal salvation can only be commended. It is a revolt of man's Divine nature against the intolerable selfishness and spiritual egotism of some religious ideals. Under

**A Serious  
Need for  
Protests** the name of their "soul," religious egotists worship their own dear personality, which they imagine is an object of

great interest to the Deity, and for which they plan out a future of continued satisfaction unmarred by the thought of their tortured brothers *below*. It is indeed well that representative voices are protesting the unworthiness of such a doctrine and allowing the Divine voice of compassion (derived from the Zoo?) to belie the wheedlings of the craven lower nature.

Well is it indeed that these unworthy old ideas should be giving place to broader and manlier ones; but we cannot build anew on the basis of scientific superstition. Is the Church to become a mere institution for social reform, and to give up its claim to superior light in favor of a willingness to be guided by the ordinary lights that guide other social and political movements? If not, on what is it to base its claim to be a superior guide? In short, what becomes of religion without the dogmas?

Theosophy answers this question by affirming that *essential* Christianity, thus stripped of its limitations, can become universal, and take its place as one among the many religions which have their common source in the One Religion. It will have to accept the perfectibility of man on this earth as its primary doctrine, admit that Jesus was not the only Christos, and declare that all men are potential Christs — and that was the teaching of Jesus, even in its dead-letter rendering. STUDENT

### Yoga True and False

**A** WEEKLY contemporary recently published another of the ever recurrent accounts of fakirs and fakirism in India.

The fakir is like the ghost. Everybody believes in him and even knows that he exists and that the accounts of him are sometimes true. But nobody is very willing to own his belief; nobody is really glad to find the fakir phenomena explained as trickery, or in his deeper consciousness accepts the explanation. And yet he has no other.

Fakirism is the degenerate remains of a nearly lost spiritual art. Or rather, perhaps, it is the still surviving mechanical part of a spiritual art.

Ages ago, and not only in India, the real seekers after the Divine had discovered much more about the inner nature of man than has been recovered since that time. They found that mind in its highest state of abstraction, raised and sustained by aspiration towards the ideal, was capable of passing temporarily beyond the influences of the body and reflecting the spiritual instead of the material pole of being. During that time the body ceased to exhibit any initiative; physiological activity declined to a minimum, and its capacity for external sensation might entirely lapse. The

poet and musician in the height of inspiration, reach for short periods the outskirts of this condition; but the outskirts only, and not by will.

And herein is the condition *absolutely unlike any reached in hypnotism*. It is induced by will, is based upon long training and self-control, is terminable at any moment by will, and is *completely closed to suggestion*. The mind, moreover, returns strengthened and cleared as well as filled with new ideals and conceptions; and the health of the body is bettered and rarified. The anaesthesia thus stands marked off from that due to drugs of any kind.

The achievement was a communion with the Divine, and in the purest days of the art men undertook its difficulties in order that they might help and teach their fellows who had not time, will, or moral strength enough for such self-discipline. They had become competent to teach concerning the Divine, Divine Wisdom, Theosophy.

"But in the process of time," says Krishna in the *Bhagavad Gītā*, "this supreme art was lost."

The difficulties in the way are obvious. There must be a love for humanity and for the Divine, and a desire to serve both, which reduces all other interests to nothing. Will must never relax for a moment in its controlling grip of the lower nature.

With these as a basis, at the times of spiritual exercise the tendency of the mind to wobble, to throw up memories and sense pictures, to think of all kinds of irrelevant matters, to attend to bodily sensations, to drift negatively, must be finally overcome. If all this can be complied with, and the faculty called by us imagination raised at will to its highest receptive activity, there will be success.

But when "this supreme art," through decay of spiritual vitality in the peoples amongst whom it had flowered, was lost, in those same places the *shell* of it lasted and lasts. Pre-eminently is it still found in India.

That physiological quietude which in the moments of absorption of the real art had come about of itself as a concomitant, and which is the lowest plane of the process, was found to be inducible by other methods — also, however, requiring extreme training of will. The animal nature has to be as utterly and continuously dominated as in the other case; asceticism has to be carried to an even extremer degree. That done, by concentration of the mind on certain physiological processes not at all known in the West — a concentration which must be absolute — the body is reduced to a condition where the mind is freed to enter certain states otherwise impossible, waking-dream states sometimes regarded by the fakir as "spiritual." The external world becomes semi-real and the cataleptic body will remain for almost any length of time in any position. Pupils may be attracted and the fakir will teach them the processes of his "art," and preach fragments of old sacred writings, aphorisms and other matter mingled with the dreams coming from the relatively low plane of consciousness on which his mind is resting. There is *no* real spiritual vision or communion, but there is a very subtle imitation; and recondite secrets of natural law sometimes *are* (ignorantly) seized and used.

Upon some of these our medieval ecstasies did sometimes accidentally light, and the stories of levitation, resistance to fire, and the like, have a basis of fact. The faith-healer has also a faint shadow of one of these powers. But none of these Western phenomena are comparable to those exhibited by the genuine fakir of India. He knows more or less what he is about. He has ages of a peculiar heredity behind him. And his will is something which in its unwavering continuity, strength, and tenacity, we hardly know. By its use, backed by fragmentary knowledge of a science we have yet to discover, phenomena that seem — and in their way are — magical are performed. These are sometimes concerned with external nature, sometimes with the fakir's own body.

But the trance fakirs and those who perform "phenomena" are usually distinct. In rare cases the fakir may be a man of considerable ability who honestly thinks that the state he has attained, which at best is one of spiritual stagnation, is a good prescription for humanity as a whole. But it is psychic morphinism. It is the lower or *hatha* yoga.

The real art was based on a life of active work and thought, of which it was held to be a part. It brought, incidentally, all those abnormal powers which in its decay became the practitioner's specific aim.

Man was fully considered in his sevenfold nature. The body was given its necessary care and exercise and maintained in perfect health and vigor. The mind and memory and reason were trained to the farthest point. And the spiritual nature was evoked and exercised daily as the completion of the perfect man. Such was Rāja Yoga, the balance of all the powers and their use in human service. It is *this* Yoga which Theosophy under Katherine Tingley will restore and will *reintroduce* in the land where it has been narcotized nearly to death — India. There are now no true Teachers of the ancient art working publicly as such in that country. The strange figures visiting our shores purporting to teach it are — fakirs. STUDENT

### Motion, Relative and Absolute

**F**OUCAULT'S experimental proof of the earth's rotation was successively repeated in January last at Columbia University, with a pendulum ninety feet in length. The plane of oscillation of a pendulum, suitably suspended by a universal joint, or its equivalent, tends to keep parallel to itself, just as does the plane of rotation of a gyroscope-wheel. If, therefore, the earth rotates, such a pendulum should be seen in an hour or so to have appreciably changed the direction of its oscillations, and this is just what happens — unless it be on the equator. It is odd to reflect that in the absence of such direct experimental demonstration there is no way of knowing whether the earth rotates or not, other than by estimating probabilities regarding the stellar universe — so long, at least, as we confine ourselves to purely external phenomena. Were the stars and planets invisible we have in this experiment a means of demonstrating the earth's rotation, independently of any astronomical objects in the depths of space, to which such rotational movement could be referred. Which seems to suggest that motion may be absolute as well as relative. STUDENT

# Some Views on XXth Century Problems

## "Leading the Higher Life"

SOME of those who talk most elegantly and sweetly of the "Higher Life" have the least conception of it. In their minds and in their practices it becomes the Finer Selfishness, and from almost the whole field of the real thing they have barred themselves.

The Higher Life is the aesthetic life: yes; but much more. And both may be led in their fulness invisibly, amid the most commonplace surroundings and threading the most ordinary doings.

Is the aesthetic consciousness the pretty things which may serve it, the old violins on the wall, the hangings, the music, and what not? Is it not rather, on occasion, the *result* of these? Indeed it and seven horizons beyond may exist in the absence of every external aid, produced in quite other fashion.

Whatever is beautiful in consciousness, whatever is refined, whatever powers of creation, of fancy, of imagination, of idealization that consciousness may possess—may all be attained by the dissolution of self in the world, in the life of humanity. If they are to go very far they *must* be so attained. If they are to be held, they *must* be so attained.

For if their possession was gotten for selfish motive, what guarantee is there that this same motive, thus encouraged and developed, may not happen to change its direction and point downward? In the end it always will.

But he who opens his heart to the call of humanity, who will feel himself constantly in the presence of humanity, feel the needs and appeal of humanity, has also, by the same effort, opened his heart to the consciousness of his soulhood. By practice he becomes completely conscious of *life*, life beyond that of his physical frame and his mind. He will need no old violins on the wall; will have within him, more and more fully aroused, that same which music and external harmony and beauty of any kind arouses in less degree. He will be independent of any externals. The body may grow old or sick, or may die. *He* will not be touched. He will have that real thing of which Comte imagined a futile imitation.

There is another party who think to lead the Higher Life by "going slumming" and such-like work. This work *may* be divinely done, or may be done without any gleam of light. The slummer may be as far from those to whom she is giving money as if she had never stirred outdoors. And some of those who, as invalids, never do stir outdoors, are *nevertheless* slummers of a real kind, radiating gentle and effective help and encouragement along inner planes of which the other sort know nothing.

For want of the heart-life, opened by opening the heart to the pull of the world's need and its sufferers and morally and mentally endarkened ones, the mind has become a tyrant. It must be fed with readings and doings and emotion-arousing diversions every moment. Life richer in every way than ours can be led without them. For at their best

the books contain *bits* of thought, and even music contains at best but *bits* of feeling. Yet the universal life, which we could enter if we would, is one vast flow of thought, one vast flow of feeling: or the universe could not proceed on its super-intelligently designed path towards the far goal. Of that limitless ocean of thought and feeling our books and our music contain at best but one single drop, and that drop may be dirty. Absorbed in that we let the rest, to which we could open the heart, go unnoticed. Mind could be filled from *within*, aroused from within to ideas, powers, knowledges, of which it cannot now conceive.

STUDENT

## The Karma of Money-Spending

SOME families in the Eastern States have been vying with each other to see which can waste most money, using the word waste in the fullest sense. In this sense it means that nothing whatever remains to show for it. One family spent 100,000 dollars on roses, at a dollar apiece, to decorate the ballroom. Another an equal amount on live butterflies collected from all over the world to be liberated at a given moment in the festivities. In another case showers of specially forced peach blossoms fell profusely on the heads of the guests. In another, five hundred canaries were liberated; and in another a stream ran through the ballroom, containing goldfishes for which the guests might angle.

All these cases meant a profuse expenditure of human labor, almost as completely wasted, reduced to nothing, as if dollar bills were held by hundreds of thousands in a candle flame.

There is a spiritual law underlying the expenditure of money. It may be broken, of course; and of course there is an equivalent penalty for so doing. The penalty may come very long after, even lives after. When the law and the penalty are better known (though in his deeper consciousness every one already does know them) much now inexplicable inequality in human life will become clear.

When a man spends money on dinner, there is his subsequent strength to show for it. Nor is he violating any law in making his dinner consist of other than bald necessities, in having it tasteful and in accordance with proper habit and his upbringing. Such attentions have their fit and desirable result. But if he has a dish of peacocks' tongues he is breaking the higher law. There is no good and fit result for himself or others.

This law does not demand of us that we lead bald and unbeautiful lives amid bare walls, nor that we wear sackcloth. As society now stands, what would be gross luxury for one is second necessity for another. There is no detailed rule everywhere applicable. The law considers all the circumstances and the *motive*. It might be kept by a man who spent a thousand dollars for a picture for his study. If his motion were ostentation, the same man by the same act would break it. It only requires that we use conscience guarded from its imitations by common sense. STUDENT

## A Theological Issue

UNDER the Pure Food and Drugs Act a certain firm is being prosecuted for declaring that a compound of its manufacture is a "cure" for headaches. The court has therefore to betake itself to philosophy and decide the meaning of the word cure.

Granted that the compound removes a headache, it may be argued that this removal is a cure. But such a removal, if effected by one of the "coal-tar" products, is the result of a poisoning of the nervous system, a deadening of it below the point of sensibility to that particular amount of pain. It is like getting out of debt by borrowing a *larger* sum to pay it.

If the headache was the result of candy or too much meat, its removal might be effected by an eliminative. But the results of the strain on the digestive organs and of the strain of the eliminative, remain, and will some time show that they remain.

One is inclined to wonder whether the doctrine of the forgiveness of sin may not be responsible for the drug taking of our time. The use of the patent concoctions is directly preventive of that intelligent and critical examination of his habits which (if necessary, with the assistance of a doctor) should be made by any man who finds himself with a persistent or persistently recurring ailment. This is not valetudinarianism. Valetudinarianism is the morbid examination of physical feeling and condition. This is a healthy attempt to answer the question, How am I sinning against hygienic law? If the knowledge of the day does not yet suffice to give the answer, take the remedies according to the best advice you can get. Do the same if you have found the cause and are determined to stop it. But to think that the effects can be removed while the physiological sin is steadily repeated, is a form of foolishness that may perhaps trace back to old theology. STUDENT

## The Death Instinct

METCHNIKOFF'S book on the prolongation of life, just translated, is receiving as much attention in the reviews as if it were a sort of new gospel. Apart from the prescription—sour milk and the rest—there is one perhaps quite new idea, and that is only true under conditions which the book does not mention.

At night we have the natural instinct to lie down and sleep. So, argues the book, in the late evening of life, when even sour milk can do no more for us, we shall have the natural instinct to lie down and *die*.

Yes, on one condition: the more or less luminous inner surety that death is no more *extinction* than sleep, that it is merely fuller rest with an awakening to follow. Why do not men get to the inner home of that surety (and other sureties) long before their death-hour? Once, at the beginnings of human life on earth, we lived there entirely. Then the outer, sensuous, consciousness began to pull. Finally the inner was deserted altogether. The history of each great Race is something of a repetition of this. STUDENT

# Archaeology Palaeontology Ethnology

## A Rhodesian Mound

IN Southern Rhodesia a curious ruin has been found. It is a circular stone building, in two tiers, about 18 yards in greatest diameter. The stones are flat, without mortar, and in irregular courses; and the ruin is in very bad repair. Directly in front of the entrance stand two monoliths, and other monoliths stand near. Excavation revealed glass, Nankin china, and common potsherds.

In spite of the existence of several "apparent graves," no skeletons were found; "and yet," says the report, "what other object than burial could the builders have had in view, in piling heaps of stones and placing monoliths about them?" And he argues that as they must have been graves and yet can not have been graves, therefore it is possible that cremation was practised.

Another difficulty is that there are no kitchen middens, so the building cannot have been a house. Neither can it have been a fort; so the conclusion is that it was a sacred building. The date is fixed at not earlier than the end of the 16th century, as "conclusively proved" by the presence of the Nankin china. But might not this prove equally well, or equally ill, that that kind of china is older than was supposed?

## Baalbek and Sun-Worship

THE illustration gives a magnificent view of Baalbek, the last rays of whose sunset glory seem destined to bridge the gap of its night until the dawn of a new era of sunrise. For, whatever its ancient builders may have been and failed to be, they were, compared with modern littleness, at least great; whatever of the true glory of the ancient Mysteries they had lost, they at least preserved in their art of building some of its nobility and vastness.

Grandly situated on the range of the Anti-Libanus, Baalbek is the most striking of the many ruins that attest the greatness of the ancient sun-worship in Syria. Its origin is what the books call "lost in antiquity," and there is no mention of it under that name in the classical writers. Its mysteries, like those from which Christianity sprang, have scarce penetrated the veil which is drawn over history in the early centuries of our era. It was the powerful rival of the Caesars, whose throne it at one time even usurped. But it strove in vain to withstand successively the Emperor God of Rome and that other God which the Christian Emperors afterwards set up. Neither God brooked a rival; and the

vestiges of the ancient faith were as ruthlessly destroyed as the mighty walls. Yet they, like the latter, have left their witnesses.

Stretching across the background we see the huge platform on which was built the Temple of the Sun. It extends for 1100 feet. The portico was on the east, to the right of the picture. It led into a hexagonal court, 250 feet from corner to corner; and this again into a quadrangular court, 440 by 370 (between 3 and 4 acres); and this in turn led into the temple proper. The temple proper had 54 columns, 19 on each side, and 10 at each end. Of these, 6 at the western end of the southern side still stand. Three of the stones in a wall are each over 60 feet long and 13 feet high, and have been raised to a height of 20 feet.

The sun-worship practised at Baalbek may not have been so licentious as interested parties have represented. But that it was a degradation of that which its name truly stands for, there is no doubt. The Sun is one of the greatest symbols of the Wisdom-Religion, denoting the All-Father, Osiris, Baal, etc. But the spiritual source of *all* life, and pre-eminently of spiritual power and illumination, became degraded to one of its own inferior manifestations—the principle of physical vitality—and, as such, was worshiped with profligate rites. The sacrifice of the personal self to the impersonal Self found its travesty in the sacrifice of human victims to the sun-god.

It is no doubt owing to the lapse and fail-

ure of these worshipers that the bigots were able to play upon the detestation of people for these practices and to fasten upon them their own narrow dogmatism. It is owing to their failure that sacred names have been abused until now sun-worship is taken to mean either a veneration of the actual celestial luminary or else a worship of some cruel fetish like the later Baal.

Theosophy is not sun-worship; but this does not prevent Theosophists from knowing that the Sun was regarded as symbolizing spiritual Life and Wisdom. There are other symbols, as the crescent and the cross—all sundered into sects nowadays, but once a unity. The crescent is the moon; the cross is earth. Theosophy teaches the equal development of man on all planes, spiritual, mental, physical. It seeks to re-unite the scattered fragments of the ancient Temple of Divine Wisdom.

## A New Petrified Forest

IT is reported that the remains of an ancient forest which covered the Mojave Desert have been found near the famous "Devil's Playground," not far from Kelso Station on the Salt Lake road.

A vast area of isolated desert is said to be covered with petrified wood of all shapes, sizes and colors; much of it showing pieces of trunks of trees of great size and solid sections of gigantic limbs. It is the first indication of former vegetation in this region, and the scene is not far from Death Valley, said to be the worst desert in the world. T.

## "Dead Universes"

A CONTEMPORARY, apparently to satisfy its readers' demand for science, quotes a somewhat lengthy and poetic passage from Flammarion, depicting the future of the universe, or at any rate of this part of it:

The earth was dead. The other planets had died, one after the other. The sun was extinct, but the stars were still twinkling—there shall always be worlds and stars.

We may be grateful for the assurance in the last clause. It is a little ray of hope in the darkness.

The sun was a black globe, the planets were other black globes, and this invisible system continued to course in the starred immensity at the bosom of the cold darkness of space.

It is not well to prophesy so far ahead. That picture is not at all according to the pointings of modern science. Science is finding the tendency of all matter to disintegrate, of atoms to lose their constituent corpuscles, to pass up the scale of atomic lightness towards hydrogen and probably beyond that into protyle. If such is the real picture, the final fate of a worn-out system is dissolution in space and then the attraction of the dissolved material around new centers to form the scenery of a new life-drama.

The poet astronomer gives us some more of his dream and then says:

Everything was covered with ice, 273 degrees below zero.

We have here a reference to what science calls the absolute zero, the point at which there is no heat, no motion of molecules, no chemical action. But we should rather say *called* than *calls*. For it has been recently found that there is chemical action down there; and if there be no molecular motion, there is not the least reason to suppose that there is no corpuscular motion. Science would not be able to show it impossible that at that temperature, where every form of matter we now know may become frozen solid, even the air, another group of "elements" might make their appearance, capable of remaining fluid and gaseous there; and another set of forms of life, capable of the most elaborate functionings in those conditions.

And then as to the dark globes. We know that there are such in space. One of the companions in certain binaries—double stars—is dark and in its revolutions occasionally hides the light of the other. But it does not follow that it is dark from deadness. It may be alive with a life beyond ours; it may be aglow with a light so high that neither our eyes nor any of our instruments respond to it.

The public should examine all these fatalistic-looking pronouncements with much circumspection. All the sciences are really in their extreme youth. It would not be very unfair to say that our chemistry is only a century old. The X-rays are only ten years old; radium only half that. Geology has hardly

yet decided upon anything as to causations and historic processes and periods.

When the earth is dead other worlds will come. . . . And these new universes will disappear in their turn, to be followed by still others. . . . The infinite space shall always be filled with worlds and stars, souls and suns, and eternity shall last forever, for there can neither be beginning nor end.

So Flammarion finishes; but his science has not killed his intuition, his inner knowledge that there is an intelligent and beneficent planning and regulation of cosmic processes, and that conscious life is not an accidental and temporary appearance in the course of a blind and mechanical flow of matter.

But some of the others are different. They lay out circles without knowing whether the curves they have are arcs and prolong their inch of knowledge to a thousand miles. Campbell must have been reading foolishness of this kind when he wrote his *Last Man*.

## The Weight of a Continent

GEOLOGY as a *history* of the earth appears to be still in its rudiments.

The differences of opinion on radical points are often complete.

For instance as to conformation: Are the continents and oceans the same as they have always been? One school, voiced by Mr. George Darwin, says yes. But another, recently voiced by Mr. Hayford in a paper read before the Philosophical Society of Washington, asserts—to use his words—that "The continents are in the habit of sinking and rising."

The latter geologist regards the earth as "a failing structure"; the former, as a structure in a healthy condition. A healthy or competent structure is one that bears the stresses to which it is exposed, either without yielding at all or without yielding further than is followed by perfect recovery on removal of the stress. In a failing structure the yield is not perfectly recovered, and it is moreover greater at some points than at others. At these the final yield or fracture occurs. In the case of the earth, these are earthquake sites.

Professor Darwin estimated that at a depth of from 600 to 1000 miles the stress-difference between such points as had a continent over them and those that had ocean was perhaps four tons to the square inch. Granite, he estimated, will stand that stress. The continents remain continents and do not sink; it therefore follows that at that depth the material must have the stress-resisting power of granite.

Obviously the argument depends upon the assumption that the continents do *not* sink.

But according to the other school of geologists, they *do* sink—a fact that it is curious to find still doubted; from mechanical considerations alone it is argued that they must. (Geologists do not, however, use the word "alone," for they do not recognize any other factors than the mechanical.)

Granite would *not* stand any such stress. If it would, it would still have to be absolutely pure and homogeneous, no faults, no mixtures of softer matter. Moreover, at the depth of 600 miles it would be molten—if the surface increase of heat constitutes a rule which we may apply deeper. Enumerating these and other objections to Professor Darwin's view, Mr. Hayford says:

Changes in elevation in the material composing the continents are put in evidence everywhere by geologic structure and topographic forms. The continents are in the habit of sinking and rising. We must therefore draw the conclusion, apparently contradictory to Darwin's that the materials of which the earth is made are not strong enough to bear the stresses to which they are subjected.

But he points out that the continents, always steadily on the make, become, for causes still doubtful, ultimately lighter in their material than the material beneath valleys and ocean floors:

According to the theory of isostasy, the material forming and underlying the continents is less dense than that under the oceans, whereas in Darwin's computations the densities were assumed to be the same. Pendulum observations (in the neighborhood of mountains) have long been known to indicate that isostasy exists.

The pendulum is less attracted and diverged by the neighborhood of mountains than it would be if the density of these were the same as it was when they arose or as it is below the ocean deeps. This lessening of the weight of continents is known as isostatic readjustment. It is generally regarded as due to the transference of matter along currents under the crust or in its deepest parts.

May not geology be here touching a vital phenomenon? It may be a long time yet before the earth is treated as a living being with an appropriate structure, with a "heart" and circulatory currents. Yet everything may remain inexplicable until that hypothesis is made, until the attempt to solve everything on mechanical principles is abandoned. STUDENT

## Frozen Putrefaction

TWO investigators connected with the Food Research Laboratory have been examining the results of food preservation by cold storage. They report that the muscular tissue of chicken, kept frozen at a temperature nearly 20° F. below freezing point showed marked histological changes after so short a period as a month. At the end of six months many muscle fibers were scarcely recognizable.

This is putrefaction, though not of the kind to which we ordinarily apply that word. And it is doubtless due to germs, though not the germs that cause ordinary putrefaction.

The most satisfactory method of preservation and storage yet discovered is without doubt the use of an atmosphere of pure nitrogen. There *are* germs which do their work without atmospheric oxygen, but none of the reports of foods preserved in this way instance the least deterioration. STUDENT

## Iceland's Homeric Civilization

**I**CELAND is one of the remnants of former continental distributions, having become isolated by geologic change from the mainland of which it was a part in days when sun warmed and frost did not bind. Yet it is not so cold as is generally imagined; and, as to its people, they are very far from being degenerate. They appear to have kept up the spirit and much of the learning of those ancient times, and to be acting as a kind of link between the past and the future, preserved unbroken during the centuries of materialistic civilization. Their land is still fiery and volcanic, and the fires still burn unquenched in the bosom of the people.

The account which follows is taken from an abstract (in the *National Geographic Magazine*) of "Iceland; its History and Inhabitants," by John Stephansson. It depicts a people who do not consider modern civilization the best that life can give, and yet can contrive to be happy, dignified, and full of life and intellectual and spiritual fire. What to others would be hardships, are to them the bounties of Nature, keeping the whole nature pure and healthy.

Geologically and geographically, Iceland is a continuation of the British Isles, for it is situated on the same submarine mountain ridge, stretching from southeast to northwest across the North Atlantic, the average depth on it being 1500 to 2000 feet, while north and south of it 12,000 feet is the average depth. Geikie thinks land connexion existed between Greenland and the British Isles in Cenozoic times, for relics of the same Tertiary flora are found in Scotland, the Faroes, Iceland and Greenland.

Iceland is not a bleak arctic region embedded in ice. Though situated so far north, the mean January temperature on the west coast is 34.5° F. higher than it should be in that latitude; January at Reykjavik is 1½° milder than at Milan; and Grimsey, off North Iceland, on the Arctic Circle, is 5° warmer than Stockholm in January. But the summer temperature is reduced by ice drifting from Greenland. Thus Iceland has a temperate climate, while the clearness of its atmosphere rivals that of Italy. It is freer from microbes than the air of any part of Europe.

No country of equal size contains so varied and wonderful phenomena; the glaciers of Switzerland; the fjords, salmon rivers, and midnight sun of Norway; the volcanoes, grottoes, and solfataras of Italy; the mineral

springs of Germany; the geysers of New Zealand; and the largest waterfall next to Niagara. Nowhere can the Titanic forces of Nature and the geological forces at work towards the close of the glacial epoch in Europe be so well studied.

Iceland is the center of a sub-oceanic volcanic region, and may be called the "Land of Fire"; for nowhere do the marks of vulcanism appear in such abundance; 107 volcanoes have been counted; 5000 square miles are covered with lava. The lava desert of Odaohraun, which covers an area of 1700 square miles, has been formed by the eruption of about twenty volcanoes; the cubic capacity of the lava being equal to a cube 50 miles in the side. [The writer must have made a mistake in his figures, as the cubic capacity would then be 125,000 cubic miles which, divided by the area of 1700, gives a thickness of over 73 miles!]

Iceland has been called "The Greece of the North." In the Twelfth and Thirteenth centuries it produced a literature unparalleled after Rome, before the golden age of England and France, in character drawing, in passionate dramatic power, in severe noble simplicity, in grim humor. The Icelander of today knows the Sagas by heart, which is as if every Englishman, from pauper to king, knew Shakespeare's historical plays and could re-tell them more or less in his or her own words. This has kept the language almost untouched by foreign intercourse and preserved the national spirit through evil times.

Nowhere is the contrast between man and his surroundings so marked as in Iceland. Buried in snow and darkness, deprived of every "comfort," living on rancid butter and dried fish, drinking sour whey and milk, dressed like his servants, seeking his food in a little boat—he yet has a cultured mind, possessing an intimate knowledge, not only of his own country, but of Greece and Rome; is a poet, intellectually and morally the equal of his European guest, considering himself your equal and refusing to be ordered about by wealth and station; and is a jack-of-all-trades, blacksmith, boat-builder, carpenter, artist in filigree work, carver in wood, eager reader of books.

There are no schools, yet every child of 12 can read. In no country of Europe are so many books printed and sold in proportion to the population. A population of 76,000 scattered in many hamlets, has 12 printing presses, the earliest having been established in 1530; and about 100 books, 14 newspapers, and 8 periodicals are produced annually.

The civilization is a Homeric one, lived close to Nature. A clergyman who died four years ago lived to the age of 113 on \$150 a year.

The winter evenings are spent with each member of the family busy at work in the same room; the man shaving wool off sheepskins, and making ropes and nets of hair; the women spinning and embroidering. There are wandering minstrels who gain their livelihood by reciting prose or poetry. STUDENT

NAY, and of hearts which follow other gods  
In simple faith, their prayers arise to me,  
O Kunti's Son! though they pray wrongfully;  
For I am the Receiver and the Lord  
Of every sacrifice, which these know not  
Rightfully; so they fall to earth again!  
Who follow gods go to their gods; who vow  
Their souls to Pitris go to Pitris; minds  
To evil Bhûts given o'er sink to the Bhûts;  
And whoso loveth Me cometh to Me.  
Whoso shall offer Me in faith and love  
A leaf, a flower, a fruit, water poured forth,  
That offering I accept, lovingly made  
With pious will. Whate'er thou doest, Prince!  
Eating or sacrificing, giving gifts,  
Praying or fasting, let it all be done  
For Me, as Mine. So shalt thou free thyself  
From *Karmabandh*, the chain which holdeth men  
To good and evil issue, so shalt come  
Safe unto Me—when thou art quit of flesh—  
By faith and abdication joined to Me!

I am alike for all! I know not hate,  
I know not favor! What is made is Mine!  
But them that worship Me with love, I love;  
They are in Me, and I in them!

—*Bhagavad Gîtâ*, Book ix (Sir Edwin Arnold's rendering)

### Life and Death

IN considering the changes of life and death as related to man, it is evident that the immortal principle of his complex make-up must be something other than his physical body. At death Nature begins the disintegration of the elements of matter which compose the body. Even where this natural process of years' duration is concentrated into an hour by cremation, to the friends of the departed he is still a reality in living thought and feeling. The bereaved parent who loses a grown-up child, has a tender, loving memory of a new-born, helpless infant, of a toddling, prattling baby, of a thinking, growing child in school, of his developing adolescence, and of dawning maturity. Though memory brings back the beloved child in a different body in each one of these pictures, there is the same deep, vital something in them all which claims and calls forth the parental love. This living something which survives the many bodies of the child, is the same Ego which reincarnates in many lives. This real something in the individual which connects the animal nature of the body to the all-pervading Spirit, Madame Blavatsky defines as that which incarnates as

The spiritual thinking Ego, the permanent principle in man, or that which is the seat of Manas. It is not *Âtmâ* or even *Âtmâ-Buddhi*, regarded as the dual monad, which is the individual or divine man, but Manas; for *Âtman* is the universal ALL, and becomes the Higher Self of man only in conjunction with *Buddhi*, its vehicle, which links It to the individuality or divine man. . . . Soul being a generic term, there are in men three aspects of soul: (1) the terrestrial or animal; (2) the human soul; and (3) the spiritual soul; these, strictly speaking, are one soul in its three aspects. Now

of the first aspect nothing remains after death; of the second, *nous* or Manas, only its divine essence, if left *unsoiled* survives; while the third in addition to being immortal, becomes *consciously* divine, by the assimilation of the higher Manas.

. . . In its very essence it is THOUGHT, and is therefore called in its plurality *Mânasa-putras*, or "Sons of the (Universal) mind." This *individualized* "Thought" is what we Theosophists call the *real* human Ego, the thinking entity imprisoned in a case of flesh and bones. . . . But once imprisoned or incarnate, their essence becomes dual; . . . One gravitates towards *Buddhi*, the other tends downward to the seat of passions and animal desires. . . . Yet it is the Ego, the *Mânasic* Entity, which is held responsible for all the sins of the lower attributes.

This philosophical explanation of man's three-fold nature is broad enough to harmonize the conflicting views of the theologians and the materialists. The theological ignoring of the higher mind, or *mânasic* principle, has been quite as misleading to humanity as the materialistic deification of the brain-mind. The teaching of vicarious atonement has obscured the position of the *real* man, or son of Mind who, by self-induced efforts of will, is to raise the natural forces of an earthly body into the service of his higher nature; and is also destined to make the immortal soul *conscious* of its *divinity* by assimilation with it. The self of body and the Self of Spirit can unite only by the intermediate alchemy of the higher mind which digests the experiences of earth-lives into individualized knowledge for the soul-consciousness. It is like the single acorn or seed which *potentially* contains all the powers of the forest or field, but which must develop from within to become an individualized tree or stalk of grain. A man may be born in a highly civilized country, but if he wilfully refuses to think and learn, though he may benefit by surrounding conveniences, his knowledge will increase only so far as he makes the facts of progress his own.

Neither education nor salvation can be operated vicariously. The church has too long cultivated ignorance by a false reverence which forbade prying into sacred things. The real blasphemy of the ages has been the theological, false, narrow and belittling conceptions of the "Sons of God" which have kept men from finding the kingdom of heaven within their own minds and hearts. Jesus taught that the truth would make men free from the bondage of sin. There is much discussion in the modern religious press and pulpit about men not wanting religion these days. As a matter of fact they have outgrown the inadequate teachings of earlier times and are seeking—mostly outside of the church—for a philosophy of life and death which shall give a religion broad and logical enough for practical everyday use.

The materialists, in reacting from ages of credulous faith and superstition, have gone to the other extreme. The modern world with its excess of commercial and intellectual development shows the lack of moral balance by the increase of physical, mental, and social diseases. Inventions have multiplied the facilities of travel, of industry, and have made possible a wider scope of living, in every intellectual activity which normally ought to strengthen the brain. But the great force of the *manas* principle is not united to the higher nature by altruistic effort; it is turned toward

the selfish nature in strenuous attempts to accumulate things and knowledge for the gratification and use of the personal self. So that instead of a tremendous impetus for the world's betterment resulting from our multiplied powers and knowledge, the abnormal use of our material gains is shown in the increase of malignant diseases and insanity, in suicide and crime.

The old teaching was, "to keep the heart with diligence, for out of it are the issues of life." The modern pandemonium shows how confused and blinded the head is without the harmonizing force of the heart life. There is no lack of brilliant intellects with many solutions to offer, and yet the social, industrial, and religious conditions do not improve. The social problem is reflected in the individual life. Who ever thinks of going to the intellectual leaders with their cry for help in sorrow, or pain or disappointment? There are specialists of every kind of thing, but the sufferer instinctively knows they have nothing to offer for his heartache and despair and blindness. He is more or less consciously sick of the many counterfeits of life, but neither the teachers nor the preachers seem to be making plain the Reality. The scientific materialist in denying immortality and existence after death is thereby failing to build up for himself that consciousness of the eternal thought and feeling which are worthy to survive, and therefore do go to make up the heaven of peace and restfulness which refresh the soul between lives.

"As a man thinketh in his heart so is he." The materialist makes his life here on earth; and his heaven is made up of the things that are fit to live with him between incarnations. A father who selfishly shuts out the joy of loving and caring for his children would leave that part of his thought world vacant, while the childless citizen whose mind aspired to help and comfort the orphans would make warmth and light and sweetness in his earth atmosphere of thought which would fill his post-mortem consciousness with its fragrance.

Mr. Judge said: "Every thought combines instantly with one of the elemental forces of nature, becoming to that extent an entity which will endure according to the strength of the thought as it leaves the brain, and all of these are inseparably connected with the being that evoked them. There is no way of escaping: all we can do is to have thoughts of good quality, for the highest of the Saviors and Helpers of Humanity are not exempt from this law, but they 'people their current in space' with entities powerful for good alone."

In view of the law that every man peoples his "own current in space" with thought entities it is important that each one be not only very consciously alive mentally but that his thought entities are fit associates for the ideal place which he hopes for here and hereafter.

L. R.

EACH man feels and knows that he has an individuality of his own, a personal identity which bridges over not only the gaps made by sleep but also those sometimes supervening on temporary lesions in the brain. This identity never breaks from beginning to end of life in the normal person, and only the persistence and eternal character of the soul will account for it.—William Q. Judge

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

## Question

An objection that has been raised to the teachings of Theosophy in regard to Karma and Reincarnation is that the Karma of the first incarnation must have been good altogether, hence producing good effects only; whence therefore comes evil? Please explain the position taken by Theosophy in regard to this.

## Answer

It is one of the most ancient teachings given in the great world-scriptures that duality pervades the whole manifested universe. As said in one of the sacred writings, "Light and Darkness are the world's eternal ways." Expressed in another way, that which we know as life or existence is the outcome not of spirit alone or matter alone but of the union of spirit and matter. All life as we know it, that is, manifested life, is the expression of spirit working through matter, or of consciousness expressing itself in substance. Using the terms light, spirit, consciousness, as synonymous, and as opposed to them, darkness, matter, substance, where the former prevails and is not in bondage to the latter there we have what is called good, but where the latter prevails there is what is called evil. It will be seen therefore that the two are relative, for speaking accurately there is neither good nor bad in the Absolute.

The teaching of Theosophy is that throughout the great cycle of manifestation spirit first descends into matter, clothing itself with denser and denser garments until the lowest point of the cycle is reached and matter reigns all supreme. Then, however, with the impulse of its own nature it begins to rise again, gradually freeing itself from matter until it ascends to its own pure state of spirit undefiled. The full consideration of this question would necessitate a volume and the student is referred to Madame Blavatsky's great work, which is now being republished at Point Loma, California, *The Secret Doctrine*.

Whence came the soul? What is its nature? Who is that being that reaps experience in that midworld formed of spirit and matter, that descends even to the lowest depths of hell and materiality, and ascends to the glorious freedom of untrammelled spirit; that is bound by law, yet possessing the greatest measure of freedom through the law? We learn from Theosophy that the destiny of this being, this divine spark of life, which in our highest moments we know to be ourselves, was to descend the stairway of the planes of nature from the world of highest spirit to that of densest matter, having always freewill within the limits of its then state of evolution, able to choose, to follow understandingly the purpose of the greater nature of which it was a part, acting thus in accord with the whole, or to separate its aim from that of the whole and seek to gratify selfish desire.

We cannot fully grasp the full meaning of evil as we find it in the world, nor from our present standpoint understand how it first arose, but there is one thing that we can and which it is our duty to understand, namely, that here in life we find ourselves at the parting of the ways—the world's eternal ways—the ways of light and darkness. At each moment of our lives we can choose to follow the good or the evil, to follow that which is in consonance with the higher side of our nature,

the divinity within, or that which gratifies the external man of passions and desires, to choose the good or the evil; and Theosophy by its teachings of Karma and Reincarnation gives a key to the understanding of our present position that is found nowhere else. By these two teachings Theosophy gives to each one the power to mold and fashion his life as he will. It shows him clearly what is the next step to take; it points to the path of true attainment, and well for us if we can see and take that next step. Whether or not we can understand the origin of evil, yet of this there is no doubt, that the true student of Theosophy may find if he will in these two teachings of Karma and Reincarnation the key by which he may overcome the present ills of life and through them solve the problem of the good and evil that we find in our lives today. We may not see how it solves the whole problem; I venture to say we do not even know what the whole problem is, but it solves the immediate problem that now confronts us, and thus by actual demonstration proves itself as wise and true.

STUDENT

## Question

Why is Theosophy so optimistic when the facts of life mostly point the other way?

## Answer

Serious exception may be taken to the statement that the facts of life point away from optimism. If we look around at the whole of nature we certainly do not find any ground for pessimism, and it would manifestly be taking a false position to regard human life as separate from the life of nature as a whole. From what we know of ourselves it is, or should be, the highest; and if it is found to be so much at variance with the rest of nature as to contradict the optimism of the rest of nature, should we not be justified in looking for some flaw which needs to be remedied?

In nature the darkest of her moods, the most stormy and gloomy, give way at last before the sunshine and the flowers; winter gives place to spring; the birds, the trees, the animals, the whole heavens proclaim the joy of life. If one were to open his heart to the influence of nature he could not be a pessimist. But aside from all this, if we have any true knowledge of man's complex nature, pessimism is an impossibility. Pessimism is the result of ignorance; and furthermore, I venture to say that it is the result of selfishness and a sign of selfishness. No man can remain a pessimist whose life is spent in working for others and seeking to bring joy to others; for, by so doing he will at last find such a deep joy in his own heart that there is no room nor thought for pessimism either as regards himself or as regards others.

The outlook upon the world at the present time is certainly dark and has been for some hundreds of years, but with the knowledge that we gain from a study of Theosophy we come to see that all progress takes place in cycles; and we learn furthermore, that humanity has been for ages on a descending cycle down into the very depths of materiality. The lowest point of this cycle, its turning point, has however been reached and passed, and we are now on the ascending arc. Within this great cycle there are smaller cycles of descent and ascent, cusps of brightness which

even the ordinary student of history may mark through the centuries. If we find the cycles of depression always followed by ascents to higher levels all ground for pessimism is removed. More than all however, if we realize what is man's true nature: that he is in essence divine; that his origin is divinity, and that his final destiny is the attainment of godhood, pessimism is not only rank heresy, but is an utterly untenable position. I venture to say that if an avowed pessimist could so arouse himself as to work for others and forget himself in that work, his pessimism would drop away from him as a dark cloak, and that he would find the spring flower of joy budding within his heart.

STUDENT

INQUIRER. Theosophy and its doctrines are often referred to as a new-fangled religion. Is it a religion?

THEOSOPHIST. It is not. Theosophy is Divine Knowledge or Science.

INQ. What is the real meaning of the term?

THEO. Divine Wisdom, *Theosophia* (*Θεοσοφία*), or Wisdom of the gods, as *theogonia*, (*θεογονία*), genealogy of the gods. The word *θεός* means a god in Greek, one of the divine beings, certainly not "God" in the sense attached in our day to the term. Therefore it is not "Wisdom of God," as translated by some, but *Divine Wisdom* such as that possessed by the gods. The term is many thousand years old.

INQ. What is the origin of the name?

THEO. It comes to us from the Alexandrian philosophers, called lovers of truth, Philaletheians, from *phil* (*φίλ*), "loving," and *aletheia* (*ἀλήθεια*), "truth." The name Theosophy dates from the third century of our era, and began with Ammonius Saccas and his disciples, who started the Eclectic Theosophical system.

INQ. What was the object of this system?

THEO. First of all to inculcate certain great moral truths upon its disciples and all those who were "lovers of the truth." Hence also the motto adopted by the Theosophical Society: "There is no religion higher than truth." . . . The chief aim of the founders of the Eclectic Theosophical school was one of the three objects of its modern successor, the Theosophical Society, namely, to reconcile all religions, sects, and nations under a common system of ethics based on eternal verities.

INQ. What have you to show that this is not an impossible dream, and that all the world's religions are based on one and the same truth?

THEO. Their comparative study and analysis. The "Wisdom-Religion" was one in antiquity; and the sameness of primitive religious philosophy is proven to us by the identical doctrines taught to the Initiates during the MYSTERIES, an institution once universally diffused. "All the old worships indicate the existence of a single Theosophy anterior to them. The key that is to open one must open all; otherwise it cannot be the right key." (*Eclcc. Phil.*)—*Key to Theosophy* (H. P. Blavatsky)

We cannot understand Karma and Reincarnation without a knowledge of the duality of human nature, and the Divinity of man.

THEOSOPHY teaches the duality of man's nature, and gives the key of Wisdom to the gateway of a pure life.—*Katherine Tingley*

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

*The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West*

## The Path

ORDINARY thought is the servant of bodily mood, of health, of ambition, of greed, of a thousand capricious mistresses of feeling. And so it reaches to nothing lasting, can know nothing real. Why not take it out of that servitude and make it at once co-worker with, expression of, and servant of high feeling?

Feeling is irritable, say in the morning. Thought is therefore critical of others.

Feeling is ambitious. Thought is wholly concerned with personal advancement.

Feeling is greedy. Thought is wholly concerned with ways of getting money. And so on.

Music carries feeling to a certain height. What would be the thoughts thought from there and corresponding to those heights? We do not know; we have never married thought to that feeling. Yet it is thought from that level that would solve many mysteries.

The attainment is not hard, nor needing much time; no extent of years, still less death.

Compassion, altruism, cordiality, good feeling—many would place these feelings below (in level) the feelings inspired by music. But very wrongly; such feeling, carried to its furthest, *includes and transcends* any that music, art or poetry, or what not can inspire. Whoever does not believe that will at least admit that such feeling is of higher level than ambition, greed, and the other common feelings from whose basis men think. Then why not use it as at any rate a stepping-stone to the ones that are considered higher, as a facilitator for them, a making ready for their hour, a method of practice? Why not hand the salt at table with a conscious emission of good feeling? Why not have good feeling as it were on tap, continuously ready for anyone about; thus leaving through the path of days and years a trail of golden light that will help and give life to every other man that meets it?

Why not put aside some moments at some fixed time in the day or night for the conscious radiation of this from the heart throughout the personality and out beyond, all over the human field? Why not, during the hours of necessary mechanical or monotonous work, keep this feeling in the heart, shielding it, as it were, in an atmosphere of thought-silence,

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

making mind play in and through and about it, not producing the common stream of aimless or injurious thought? Every such effort, sustained but five minutes, is a preparation for, a strengthening of, those special moments that we have agreed to set apart.

So doing, so living, one day not far off, in those special moments, the Christos, the divine child, will be born; the field of consciousness will be lit up by a new sun; that state will be suddenly reached which is to what we now call the human, what the human is to the animal.

If there are few who in our day achieve this, it is simply because there are but few who will practise it. STUDENT

## Connexion Between Moral and Physical Calamities

GREAT plague epidemics not only kill many people but leave their traces on the living, said Professor W. J. R. Simpson in a paper before the Royal College of Physicians, London. These effects are social and psychological. Minds become overwrought by the awful conditions. The normal courage, solicitude for the sick, hope and religious trust, which belong to the healthy mind, give place to intense pity, religious fanaticism, and despair. Then follow panic and a revulsion of feeling characterized by fear, selfishness, heartlessness; and later still there may be a display of all the most sordid passions.

After the Black Death came the Flagellants, who marched through European cities, scourging each other's bare backs with thongs containing sharp iron points. Epidemics of dancing mania also followed, and cruel persecutions of the Jews.

The lecturer attributed these moral disturbances to the distress caused by witnessing and experiencing the plague. But a Theosophist would suggest that they were, in large meas-

ure at least, part of the plague itself. The Astral Light becomes polluted by men's thoughts and habits until the sources of life and health are poisoned. Some people are attacked physically, others mentally. Cataclysms, mental, physiological, and even social, political, and terrestrial, belong to the same category.

All are produced by severe disturbance in that invisible source for which modern knowledge has no name, save, perhaps, inaccurately enough, the "ether," but which Theosophists call the "Astral Light." For this reason epidemics, moral disturbances, earthquakes and other calamities are always associated. May they cease when "the still small voice" sounds again! STUDENT

## The Cause of Rebirth

IN general, all the matter visible or held in space still unprecipitated, has been molded at one time or another into forms of all varieties, many of these being such as we have now no idea of. The processes of evolution, therefore, in some departments, now go forward with greater rapidity than in former ages because both *Manas* and matter have acquired facility of action. Especially is this so in regard to man, who is the furthest ahead of all things or beings in this evolution. He is now incarnated and projected into life more quickly than in earlier periods when it consumed many years to obtain a "coat of skin." This coming into life over and over again can not be avoided by the ordinary man because Lower *Manas* is still bound by Desire, which is the preponderating principle at the present period. Being so influenced by Desire, *Manas* is continually deluded while in the body, and being thus deluded is unable to prevent the action upon it of the forces set up in the life-time. These forces are generated by *Manas*, that is, by the thinking of the life-time. Each thought makes a physical as well as a mental link with the desire in which it is rooted. All life is filled with such thoughts, and when the period of rest after death is ended *Manas* is bound by innumerable electrical magnetic threads to earth by reason of the thoughts of the last life, and therefore by desire, for it was desire that caused so many thoughts and ignorance of the true nature of things.

## LAST SUNDAY AT ISIS THEATER

THE regular weekly Sunday meetings at Isis Theater, San Diego, are always well attended by those interested in the philosophy of Theosophy and the aims and objects of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, but last Sunday evening an unusually large audience gathered together to hear an interesting address by Mr. Iverson L. Harris on "Equality." Mr. Harris is always listened to with attention and interest, for his addresses are marked by thought and research and are clothed in the language of natural oratory.

As this page, though devoted to the reports of the meetings at Isis Theater, comprises space too limited to report the address in full, Mr. Harris's remarks will be published *in extenso* on pages 2 and 3 of the next issue of this review.

## Some More Aspects of Modern Christianity

CHRISTIANITY AND ALCOHOL

A CLERGYMAN writes in a newspaper to explain his view of the relation between Christianity and the drink question. He says that much harsh language is used tending to imply that the use of alcohol is forbidden to Christians and that brewers have forfeited the right to the Christian name. But this is the old heresy which regards material things as in themselves evil, whereas to the Christian religion the seat of evil lies, not in material things, but in the perverted will of man.

There is not, he says, a word in the Bible which treats wine or strong drink as themselves an evil. There are many denunciations of drunkenness, but not of drink. There is nothing in the Christian religion which forbids a moderate use of alcohol. The wedding feast of Cana and the Eucharist are mentioned. He recognizes the noble efforts of those who voluntarily abstain in the hope of saving the victims of intemperance, but does not regard them as setting a standard for average humanity.

He is against the abolition of the drink traffic and in favor of its regulation. It is not in the interest of intemperance, but of temperance, that he is opposed to the prohibitive measures of the day. Christianity and common sense alike demand that we must treat men as free and responsible beings capable of self-control and self-knowledge.

However good all this may be, one feels it is not the best. The brewers and distillers will welcome this sermon. The Churches may be against alcohol; they may ignore the question; any other attitude will be interpreted as favorable to it. The arguments sound like an apology; the position taken by Christianity as thus defined, is not a strong one.

It is not possible nowadays to treat alcohol as an irrelevant matter, as it was in the days of Jesus and of the Old Testament writers. It has become an urgent problem. All earnest

people, all professed leaders, must take issue one way or the other. No doubt some reformers injure their cause by over-zeal; but the cause is a good one, and Christianity should not discourage it. If total abstention is necessary for some people as a help to others, surely Christians, and especially ministers, should be among the number of such abstainers.

CHRISTIAN SOCIALISTS

A LARGE number of clergy and ministers in England have, say the papers, signed a manifesto intended to make clear what they understand by Christian Socialism. They make the declaration in view of the widely circulated suggestion that the Socialism they believe in differs from the Socialism advocated by other Socialist organizations.

They declare that Christian Socialism involves public ownership and management of the means of production, distribution, and exchange, and is therefore essentially the same as other Socialism. They feel that this economic doctrine is in perfect harmony with their Christian faith, and that its advocacy is sanctioned, and indeed required of them, by the implications of their religion. The signatories include ministers and priests of very various denominations.

THE "OPEN PULPIT" POLICY

MEMBERS of the Episcopal diocese of New York are protesting against the policy, in full force there, of opening the pulpit to preachers of other denominations. They think it will produce chaos. Others think that if the Episcopal Church cannot stand such a test, it will and ought to perish.

One's sympathies incline to the protesters; for "what is the use" of having a church with certain fixed dogmas and rules, and then inviting opponents to air their views in its pulpits—unless indeed it be for the purpose of confuting them, which is, however, evidently not the case?!!

T.

## Poisoned Paper

WHAT becomes of the hundreds of tons of newspapers with which we daily poison, stupefy, or instruct our minds?

The mass is not exactly paper, defining paper as a product of linen, any more than what is printed thereon is exactly literature, defining literature as a product of thought. A good deal of it is wood pulp. The stately tree beneath whose shade the cows picturesquely lie in the afternoon sun, may become degraded into the service of Blank's Elixir or be forced to tell you about the last divorce or murder. Like the minds which poison, stupefy, or instruct themselves in reading about these things, it has to incarnate again and again.

The information about the Elixir or the divorce has necessitated its being smeared with printer's ink, which is made of small particles of carbonaceous lampblack mixed with an oily basis. For its reincarnation the paper mass,

after reduction to a pulp, has to be cleaned of these particles. That constitutes the difficulty. The sticky oil is washed out with soap, and then, little by little, with much use of water, most of the particles can be filtered away on a sieve. But the paper is never quite as white as before. If the printers would only use other ink, bleaching could be employed.

There are two obvious limits to the process. The pulp may be so gray that it cannot be used any more. Or after a few times the fibers may be so broken that they cannot be worked up into paper. It has then a chance of rising in the scale of evolution, either being burnt and returning to nature, or being subjected to great pressure and made up into useful articles.

How much of, say a hundred tons of, newspaper stuff had better never have been printed and read? Ninety-nine? And how much more virile would be the mind of the nation if the time spent in reading that ninety-nine tons had been spent in thinking, or in reading real literature?

STUDENT

## Romance in China

THE Shanghai correspondent of the London *Times* gives some interesting facts as to the spread of Western literature in China. There is, it seems, a native Commercial Press with agencies throughout the Empire. Most of its publications, either translations or written after Western models, are sold at an extraordinarily low rate. There is a textbook on *Elementary Ethics*—what would Confucius have thought of it?—going for five cents; there are *First Readers* at ten cents, and handbooks on the various sciences for forty. Novels are also getting into demand. Already there are 220, including *Treasure Island*, *Robinson Crusoe*, *Ivanhoe*, *The Talisman*, *Les Misérables*, and *Sherlock Holmes*.

The Chinese have a little difficulty with our novels. Says the correspondent:

It must be borne in mind that our romantic and sentimental treatment of the relations of the sexes is a thing so foreign to Oriental ethics that the hero of the ordinary European novel appears to the Chinese mind as a person of perverted moral sense and doubtful sanity.

The Chinese are not against the emotions; they have them in plenty. But they consider that to pour them out in the sentimentality which is the motif of our novels is a waste of good material. There is nothing afterwards to show for it. Since the most excellent and durable marriages can be happily arranged without it, why be at so much unnecessary emotional cost? With the same amount of energy, usefully directed, you could become a "Pricely Man" and a benefit to the whole community. The dollared man seems to them a bad substitute.

But it is hopeless; we can never make them take *our* point of view!

STUDENT

### The Dream of the Charioteer

These finite bodies which envelop the souls inhabiting them, are said to belong to Him, the eternal, the indestructible, unprovable Spirit who is in the body, wherefore, O Arjuna, resolve to fight. — *Bhagavad Gītā*

And that power which the disciple shall covet is that which shall make him appear as nothing in the eyes of men. — *Light on the Path*

THE day's work was over, and the student sat in his tent, weary in body, but composed and joyful in mind, thinking over the events of the day, noting the mistakes he had made, and building and cementing a basis for the future upon the results of the derived experience. Deeply absorbed in meditation upon the realities of life, his consciousness slowly passed into the land of dreams, and this is what he dreamed:

He found himself seated in a chariot and driving a team of restless and spirited horses. Before him stretched a vast plain, the horizon of which was hidden in a haze of golden light, and above gleamed a bright and glorious sun which filled the whole atmosphere with a vitalizing burnished glow, bearing with it the very essence of life.

By the side of the charioteer was seated a radiance, an impalpable being, felt rather than seen, whose presence seemed to carry the virtue of the distant golden orb. By unspoken words, the companion of the charioteer communicated guidance, encouragement, and knowledge.

As the journey proceeded, the charioteer became conscious every moment of disturbing influences. Unseen shapes of threatening aspect forced their way out of the air, and disturbed the driver's power and nervous energy. Shadowy and formless, they flitted here and there in myriads, so that he became aware that not one moment could be spared from the effort to hold them at bay. Now they settled upon one of the horses and now upon another, threatening to prevent the progress of the team. Over and over again the horses, possessed by these entities, almost obtained control, and turned upon their course in a vain attempt to run away. These dark and cloudy beings whispered of their essence into the inner ear of the driver so that he had to maintain the closest vigilance not to listen to them.

The iron weight of circumstance tried to oppress his heart. Vague longings from a dead past, foolish likes and dislikes, silly regrets for necessary experience, curiosity as to the future, criticism, the inertia which suggests a little rest or relaxation of endeavor, the tiny want of fine temper which gives a shade of annoyance, all these and many more became present when perceived, and they increased in size if encouraged for an instant.

And yet, and yet, all the time there stood the warm and joyful sun, and all around was the glorious golden glow, and by the side of the charioteer sat the ineffable and radiant being, ever ready to warn and teach and help, and to bring into his heart the joyful calm of eternal power over the flitting shadows of darkness.

And then also the teacher seated by the side of the charioteer pointed out to him that he was not alone on this great journey towards the sun. Near and afar he could see his

comrades seeking the same goal, and fighting the forces of darkness under the same guidance. Sometimes they were before him in the journey, sometimes behind him, and yet somehow they were always by his side. Their steadfastness and their watchfulness were ever present in his heart as a part of the battle. His love for them was as that of brother pilgrims whose one endeavor was the one great end, and whose mutual faithfulness was the salvation of all. Every success called forth his joy, and every failure invoked his pity without a shade of judgment.

Then suddenly the scene was changed. Horses and chariot and teacher were gone, and the charioteer stood alone upon the shore of time. All had become one being, and the long journey was past. The knowledge and the power were now part of the very nature of him who had been student, and he could go where he would at the call of appointed duty. The dark forces could no longer mold his nature to their will. He was free.

Facing the radiant sun and bathing his soul in joy ineffable he now had before him the great opportunity. He would go back and help those who were struggling on the road, that they too might come to know what silent glories are to be attained by the powers which lie within the human heart. He had forgotten himself.

STUDENT

### The Mystery of Gold

THERE is something of a mystery attaching to gold which its mere unalterability does not explain. In every age known to us it has been the symbol of all that is noble in human nature. The ancients, looking back to an age when man was still pure, could think of no name so fit as the Golden Age.

Is its mere inoxidizability a sufficient reason? That might make it a symbol of permanence, but permanence has never been so symbolized! It is found in small quantities and extracted with difficulty. Why in the very earliest civilized ages should the difficulty have been faced? It is and was a medium of exchange, but why should that mere convenience morally ennoble it? It excited unlimited cupidity, but remained noble. It is yellow and sun-colored; but so is brass, and so is *not* silver which was also regarded as pure and noble.

It is unalterable, *i. e.* itself always; there certainly it does stand nearly alone. Take what care of them you will of them, practically all the other metals — except silver — are short-lived. After a few years' exposure to the air they return to nature as oxides and carbonates. But the metal gold remains the metal gold. Says Mr. Wagenen recently in the *Popular Science Monthly*:

The coin which you hold in your hand today may, for all you know, have been part of the gilding of the dome of King Solomon's temple in Jerusalem. The case of the watch in your pocket was perhaps taken from the mines of Spain by the early Romans, a thousand years before our era. The ring you gave your betrothed may be wrought from a lump of metal washed by the prehistoric miner from the stream beds of Rhodesia or India.

Does the quantity of gold in the hands of mankind change much from age to age? At first shot the answer will be, yes; but it is not certain. The crop for the year 1906 was 674 tons, in bulk about a ten-foot cube. The

average increase in the crop for a century appears to have been about 5 per cent.

But coins are steadily wearing out; so are rings. A good quantity of gold disappears into teeth, and is used up in photography, gilding, and so on. Moreover the metal is *volatile*. Careful investigation has lately shown that a leaf of silver foil, suspended under a glass bell over gold, gains in weight at the gold's expense, becomes in fact gold-plated. The evaporation is almost immeasurably slow, but not quite. But when archaeologists have learned the real antiquity of some of the ruins they study and to which they assign an antiquity of some very few thousand years, they may, if they are also chemists, think it possible that gold has actually thus disappeared. Old races, too, like the Aztecs, may have buried gold to preserve it from invaders, and there must be very much of the metal here and there on the ocean floors.

There is no reason to think we are near the end of the supply. And there is some reason to think that gold, under certain circumstances, grows. Certain chemists are even now searching for the soil of its roots, its seed, its parentage, and the kind of irrigation necessary!

STUDENT

### Water Power Replaces Coal for Railroads

IN Austria the increasing cost of coal has led to plans for using electricity generated by waterpower on the State railroads in the Alps. It is fortunate that the very mountains which make such a demand on power should also furnish it so abundantly. The State is hurrying to secure the available water-power for this purpose before the private manufacturers have taken it all.

In Germany there has been an agitation for making all water-powers a State monopoly, but the cost of such an acquisition would be enormous. The policy is therefore rather to encourage private power companies (for generating electricity by water-power), but to place them under great restrictions preventive of monopoly and abuse of privilege. The power companies in Baden have to return to the power consumer all profits over a certain percentage, special tariffs are forbidden, and State and Local Government requirements have to be preferred. It is hoped that this development, under wise restraint, will compensate the lack of coal and open a new industrial era.

T.

### Electric Illumination

WHAT may turn out to be an important improvement in illumination consists in passing a high tension electric discharge through rarified gas contained in a glass tube which is provided with a means of automatically maintaining the necessary interior gas-pressure. The light of a tube filled with nitrogen is of a rich golden color, and with carbonic dioxide a whitish blue. The latter has a remarkable power of revealing tinted surfaces in daylight colors, rendering it especially suitable for artistic work in long evenings. The light intensity is directly proportional to the voltage, instead of the fourth power thereof as in filaments. Hence the light is much steadier. The cost of erection and maintenance is stated to be much less with equal light than for incandescent lamps. J.

## Thor and the Midgard Serpent:— Version from the Edda

ONCE upon a time, at a festive gathering, the Asa-gods decided that all the powers admitted to the peace-alliance ought to show their veneration by feasting them at least once a year. The casting of lots showed that the sea-giant, Ægir, was to be the first host of the gods, and Thor was sent to notify him. Ægir did not refuse but, offended by the authoritative tone of the message, he wished to show his indignation and so told Thor that his kettles were not large enough to make all the mead that would be required for such an occasion, although Thor might be able to provide him with one of larger size. This done, the gods would be welcomed and feasted at the time of the year when the flax was harvested.

Such a kettle was not to be found in Asgard, but Tyr called to his mind that his stepfather, the giant Hymer, had one. It was a dangerous endeavor, however, to try to get it, as the eyes of this giant had a destructive power when looking in wrath on any object. But Thor was ready for the adventure, and so the two gods departed on their errand.

Arriving at the home of the giant they were heartily greeted with the horn of welcome by Tyr's mother. Hymer himself was out hunting. The hall was immense and the roof sustained by mighty stone pillars, on one of which eight kettles were hanging, among them the one sought for.

In the evening, when Hymer was expected home, Tyr's mother requested the gods to hide behind the stone pillar with the kettles. Soon Hymer appeared. His wife greeted him with the joyful news that their son at last had come to visit them. The giant looked pleased, but when hearing that Thor, the friend of men, accompanied him, his eye became dangerous. "Look at that pillar, there they are," advised his wife. He looked, the mighty pillar burst in pieces, the kettles fell and were broken, all except the largest. Now the giant was harmless, as it took some time before a repeated discharge of the power of his eye could take place. The gods came forth and, after having scanned Thor, Hymer found it safest to give them a friendly welcome. Three oxen were prepared for supper and of these Thor consumed two for himself.

In the morning Thor proposed a fishing tour and asked Hymer what he used to bait the hooks. Hymer, who had a herd of gigantic and ferocious bulls, said: "If thou darest, go to my herd and take thy bait." Soon Thor reappeared with the head of a black bull and

Lomaland Photo. and Engraving Dept.

### THOR AND THE MIDGARD SERPENT

(ANDERS WISSLER) — STOCKHOLM, SWEDEN

Hymer looked very grim. Out in the sea they began their fishing, and after a while Thor felt a heavy pull upon his line. The Midgard Serpent had devoured the head of the bull. At this time he was already a monster of fearful size, though not at all as large as he finally will be. Thor hauled in the rope, in spite of the efforts of the serpent, until he had the head out of the water. One of his hands held the rope; the other caught the hammer from his Girdle of Strength and with it gave the serpent a blow on the head. It was a heavy blow; the serpent howled and weltered so that its groans resounded from the very depths and the whole earth shook. However, it finally pulled itself loose and sank again into the sea. [One version says that Hymer cut the rope and thus liberated the serpent, but all agree that the serpent was set free.]

At home again, the giant expressed his wish to see other proofs of Thor's strength, so he announced that one of them should carry the large kettle out of the hall. Tyr tried in vain several times, then Thor lifted the kettle over his head and went away, Tyr going with him. As they did not return, Hymer grew uneasy and hurried out, calling the giants to his aid. The fight ended in all the giants being

killed, while the gods returned to Asgard in safety with the kettle.

The Midgard Serpent came to life at the end of the Age of Peace. Gullveig (the golden stream) and Loke (the fire), both related to the giants, were admitted to Asgard and to Midgard, the world of men. When the gods, however, perceived that innocence and peace were threatened by the secret work of Gullveig, she was burned. But her heart would not burn, and Loke found it in the ashes and devoured it. After a time he gave birth to a serpent, which was thrown into the sea and there grew with fearful speed. Soon it was the greatest monster in the sea and in the course of ages will circle round the whole Midgard. It grows as fast as evil grows on earth and will be full grown when corruption has reached its culmination and the destruction of the world is near. Then, in Ragnarök, the "Twilight of the Gods," as it is translated, he will receive the second, deadly blow of Thor's hammer, though at the same time Thor is to be killed by the poison of the serpent and, after retreating nine steps, is to fall dead to the ground.

Gullveig's thirst for life was so great that after being burned she soon was reborn. When the god Heimdall wandered over the earth, carrying the sacred runes from place to place, she came in his track with her profane and destructive runes, spreading with them evil among men. Once more she was burned, again Loke devoured her heart, this time giving birth to the Fenris-wolf.

A third time she was reborn and burned. A third time Loke by devouring the heart gave birth to a monster, this time Leikin, the pestilence, who became queen of the spirits of illness.

This is the tale of Thor's fishing, and of the Midgard Serpent, and the mighty things that will transpire in that day when the old order of things passes away, as given in condensed form from the Edda—a subject which has been beautifully, though not mystically, handled by a modern poet, Longfellow. The cut represents the battle between Thor and the Midgard Serpent and with rare boldness and sympathy the theme has been handled by the sculptor. May its lesson sink into our hearts! The marvelous symbology of all the old Norse tales of gods and giants, of the forces of light and of darkness, of the doom of men and nations forewrit by their own past deeds, is as a book of revealings to those who can read, and who know something of the soul's laws.

A SWEDISH STUDENT IN LOMALAND

### Fragments of an Old Spanish Record

(Translated by a Student)

I HAD been for some time trying to get out of a swamp and at last came to the edge of it where I observed that two paths met. They led in opposite directions and for a short way seemed much alike, with trees and flowers at the sides and with occasional high arches, like gateways, spanning them. One, however, continued smooth and inviting for a somewhat greater distance than the other, in which I could see, not far off, sharp flints strewn along, and briars instead of roses at the edge. It had, moreover, a familiar look, although as I had never been in that part of the country before I did not suppose that I had ever seen it. Looking closer I saw, very far in the distance, what seemed to be a mountain, with a faint glow as of a light half way up the side. A purple haze softened the outlines, but I supposed this to be an atmospheric illusion due to the intervening space. The other path, after a little way, became lost or obscured and, I judged, led into some valley. There was a fascination about the mountain and the strange glow and so I took the road at the end of which it was.

I soon found, to my surprise—for while struggling in the bog I had thought myself entirely alone—that I was one of a large company. While all, like myself, seemed to be bent on reaching the mountain, with few exceptions they were industriously working together to clear away the flints, stones and other stumbling-blocks in the path, and to level the rough places. Some were engaged in pulling up the brambles at the edge, replacing them with roses and soft beds of violets. A number of those who were not helping, saying that they found the work hard and uninteresting, dropped behind and were lost sight of.

I asked one of the company to tell me what they were doing and he said that they were,

like myself, trying to reach the mountain in the distance. I remarked that they would reach it sooner to dispense with this gardening and road-making and bend their energies upon getting ahead, but was told that the only condition of their being permitted to reach the mountain at all was the one they were fulfilling—to leave the path as level and beautiful as possible behind them. "More than that," said one of them, "we have to *work together* in doing it, and peaceably." "It is not like any other work," the Leader says, "and we know that it so, for if any part of

**H**E who does not practice altruism; he who is not prepared to share his last morsel with a weaker or poorer than himself; he who neglects to help his brother man, of whatever race, nation or creed, whenever and wherever he meets suffering, and who turns a deaf ear to the cry of human misery—is no Theosophist.—H. P. Blavatsky

it is done in the wrong spirit, it undoes itself the moment one's back is turned and then we have to do it all over again." "And besides," added a third, "even if we could reach the mountain by leaving the path just as we found it we would not do so, for we do not want to leave the least thing to discourage those who will come later." It was a queer company, and as someone pointed out the Leader to me I rushed up to her, asking her to let me help with the tremendous load she was carrying. She said kindly, a little to my surprise, for I had been allowed to think always that my services were valuable, "Suppose you go back and help the others."

I did so but found the work trying. Some were always stumbling into holes or getting scratched on thorns because they didn't use their eyes, while I, who had, as I learned later, been on that road before but had forgotten it, went along for a while without any

trouble at all. I tried to show some of them the pitfalls, but they misunderstood my efforts. But, for that matter, my own help could not have had much value, as will appear, and the harder I tried to make it valuable in the eyes of the Leader the less I succeeded.

At last, when I thought some of them were saying what I took to be very untrue things about me, I dropped the work entirely and rushed forward again to the Leader, knowing I had not done the duty assigned me but thinking that if I explained to her fully about the stupidity and unreasonableness of the others, that would answer the purpose as well. She heard me patiently, although I could see that the recital made her very weary, and then said, "So you didn't fall into any of the pitfalls?" I had supposed that a matter for congratulation, but from her manner it didn't seem to be. Then she added, "Why don't you stand up?" I do not pretend to interpret the words. I am simply writing down what was said. To me they were perfectly meaningless at the time, for my strong straight carriage and correct walk had always been with me a source of modest pride. The Leader put her hand on my forehead and affectionately pushed it a little back so that she could look squarely into my face. She herself was very tall. In a moment she said, reflectively, "If you were absolutely sincere—" "Oh, I am, I am," I cried eagerly, as she paused, "Try me, only try me." She paused again. "Very well," she said finally, "but I shall not be beside you when you will think you need me most."

We were at that moment approaching one of the gigantic arched gateways that at intervals spanned the path, and I suddenly found myself quite alone. Whether I had passed through the archway without knowing it, whether the Leader and her companions had, or whether I had been mysteriously transported to another place altogether I have no idea. All I know is, the region was cool

and semi-mountainous, with an abundance of flowers in a few sunny, low places. I had not time to observe it closely for almost at once there half crawled, half lunged, out of a cave in the mountain side the most frightful creature I had ever beheld. I am not permitted to describe it, so will only say that in a flash all my assurance forsook me and I fled in terror, in and out among the winding and rocky passes, often stumbling, only to pick myself up badly bruised and in an agony of fear as I felt the Creature's fetid breath upon me. Soon I came to what seemed to be a deep inlet from some near-by sea. An enormous raft was floating upon it and I plunged into the water. But the raft, as I climbed upon it, shook as with a convulsion. I looked back at the shores. I felt the the hot breath on me again and, as the raft was once more hurled by the disturbed water against the bank, I leaped from it. But the ground beneath my feet was heaving with earthquake. I looked up and saw, or thought I saw, at a little distance from me, the Leader, and I cried out to her in agony, "Save me, save me, will you not save me?" She did not see me, or if she did made no reply, but slowly turned her back upon me.

A time passed, whether a second or two or many years I have no idea, but at any rate when it passed I was conscious of standing on firm and solid ground in the midst of an old and very beautiful country, and looking down at a crumpled heap at my feet — which I recognized to be myself; the Thing was mouthing over it. In an instant, immense as the Creature was, I had it by the throat, although its size would have made no difference, as my will had barely touched it when it fell to the earth lifeless. Fear had entirely left me; in fact, I did not think about it at all. I then saw the Leader coming toward me with a great kindness in her face. "What a pity," she said, "that you did not strangle it at the start and save all that time." I felt reproached although I knew that the cowardice had belonged only to the dead part lying there.

"What is it — this Creature?" I asked.

"You ought to know," was the reply, "you helped create it. It has a certain vile inner life of its own, yes, but the body of it was formed out of the thoughts of —" she looked at me as if dreading to go on.

"Did I form it?" I asked, in dread to hear the reply.

"You did."

"But —" I was trying to recall if any thoughts of mine had ever been as horrible as that.

"Pride and self-will," the Leader went on, "conceit and vanity, jealousy, anger and suspicion — are they not as vile?"

"But had I no good thoughts? —"

"Yes, many, but only at times. Yet it was these that built up this body you now have and which gave you the strength to kill the Creature."

"Tell me," I said, "must everyone meet this Creature?"

"That depends," she said. "Everyone who has had a share in building a body for it will some time meet it, but not all will meet it now."

"Then it will have other bodies?"

"Many others — until men learn not to build them."

"But why did I have to meet it now? Others do not."

"You challenged it," she said.

"Tell me," I begged, "only one thing more. Its body is dead. May it not be that something of its evil inner life is killed too, or, if not that, then weakened? Will not the battle

## Jottings and Doings

(From a Student's Note Book)

IN a notable speech made recently before the British Association, London, by a distinguished man of science, Professor H. E. Armstrong, some remarks were made anent the woman question which furnish material for profitable reflection. Referring to the ever-increasing number of women who invade the business and professional world, the speaker pointed out that there has been in many cases a corresponding neglect of natural duties and, in consequence, a growing incompetency in their performance. He quite reasonably asks why, if men are required to give evidence of their ability to provide for a home, women should not be willing to prove themselves competent to fulfil their proper duties therein, declaring that the foundations of the home and

of national life are being undermined by the present tendency of women to disregard their domestic responsibilities. While there will have to be a readjustment of ideas on both parts as to the duties of men and women in the true home, it is unquestionably a fact that women have strayed from middle lines in their efforts to be free from the age-old superstitions which have enslaved them so long. It was inevitable that at the first loosening of the fetters the pendulum should swing beyond the point of equilibrium and result in incongruous and even grotesque exhibitions, but as inevitably it will swing back again, at last to seek and find the perfect balance.

Katherine Tingley has said again and again that in the home women as a whole have their greatest opportunity, both for the unfoldment of their own highest powers of mind and heart and for service of the race. That so many seek other fields for their best efforts simply reveals that as yet a true conception of the sacredness of the home has not been grasped.

"My present object," said Professor Armstrong, "is to file a petition on behalf of the weaker sex, man, a frail creature and almost absolutely dependent upon woman's will and ways" — words said in humor, possibly, but with a deep meaning, read between the lines.

Little by little, year by year, the barriers are being torn down and facts heretofore obscured are coming boldly forward into the light of day. The folly of one-sided views is becoming more and more apparent, and by the time the search-light of Theosophy is turned upon the "woman-question" the old stock bugaboos that have fought it out with each other so many years — "neglected man" on the one hand, and "woman's oppressed past" on the other — will be scared completely away and we will suddenly discover that there is no "woman question" at all, and never has been in the old sense. The question really is that of the inalienable rights of the Soul.

## THE MUSEUMSBRÜCKE IN OLD NÜRNBERG

A very truism, when uttered by a Teacher, has a deeper meaning for which the student must seek, but which he will lose if he stops to criticise and weigh the words in mere ordinary scales. — William Q. Judge

for the next who challenges it be a little easier?"

"Yes," said the Teacher, "it will be." I saw a look of youth and loveliness come over her face, and I thought of the Comrades of that old march, not as before with an eye to their slips and failings and with a mind to help them providing only that I could do it my way, but with a great love welling out of my heart that transfused them as with a golden light and transfigured them as they rose in memory, until they seemed like gods.

The mountain was just ahead. The light in its side shone clear, with seven sides, and I saw that the purple glow about it was a part of it and not an illusion due to distance as I had supposed at first.

"You may go ahead if you like," said she, "They will receive you."

"No, no," I pleaded. "Not that. Let me go back with you. See, thousands upon thousands are entering the path and, level as we have made it, they slip and suffer. And see — there are children among them. Don't you want me? Don't you need me? Will you not try me again? I can surely some time learn to help."

"Yes," she said, "You can learn to help now. But so many years have been lost."

# OUR YOUNG FOLK

## The Enchanted Island

**S**INBAD the Sailor! How many boys and girls have flown with him over enchanted lands and seas, seated on the broad back of that tremendous bird, the roc! Sinbad the Sailor is not the only one to know of enchanted islands, for enchanted islands exist today, as well as in days of yore, and so do magic birds.

I know of an enchanted island, with rugged mountain-peaks and deep valleys. A high sea-wall guards it on the side of the setting sun. This sea-wall has been carved and fretted by the waves into magical caverns. The walls of these glow with tints of coral, emerald and amethyst. The high vaulted ceilings are supported by pillars fantastically carved and hung with colors like a tapestry. On the highest mountain-top of this enchanted island stand snow-white palaces with jeweled domes and towers that sparkle and shine from sunrise to sunset. Even when the shadow of night has fallen they still glow, for light is within them.

Nestled down in the valleys of the enchanted island are tiny homes. Some are round and green; and like birds' nests, are hidden for sweet security in a bower of shrubbery. Others dot the hillsides, white and shining, as the tiny sailboats that flit like snowy butterflies over the turquoise blue sea. In the snow-white palaces all the children go to school, and they learn their lessons, dance and sing under the magic domes.

Like all the happiest people who ever lived in the world the people of this enchanted island have a Queen whom they love and serve. It is the dearest wish of the heart of this Queen-Teacher that all the people in the world shall be happy, good and useful; and especially that all children shall be as happy as the little princes and princesses of the palace school. All the people of the enchanted island have promised to help make this beautiful wish come true! Even the very tiniest baby princes and princesses lisp "Happy, happy!" the very first word!

So every morning a band of Queen's Helpers sally forth from the snow-white palace on the hill, to make a pilgrimage of joy to the neighboring kingdom, carrying the messages of their Queen. As they pass down the royal avenue, the stately palms sweep their long plumed leaves to the ground in gracious salutation, and from palm to palm passes a soft murmuring sound: God speed! Then away they go, through the snow-white portal, across the Queen's highway, till they come to the little gateway of the Whispering Path. Such a sweet green shady little path, where the leaves with silken rustle whisper all day long of fairy revels by moonlight; and on the grass, glittering in the sun, are stretched the fairy pavilions. Then the path suddenly widens out into a broad sunny garden, with fair maidens tripping all about, who tend the trees and flowers with loving care like the dryads of olden time.

ANOTHER GLIMPSE OF SANTA CLAUS IN LOMALAND, 1907

## A SONG OF THE FUTURE

Sidney Lanier

**S**AIL fast, sail fast,  
Ark of my hopes, Ark of my dreams;  
Sweep lordly o'er the drowned Past,  
Fly glittering through the sun's strange beams;  
Sail fast, sail fast.  
Breath of new buds from off some drying tea  
With news about the Future scent the sea:  
My brain is beating like the heart of Haste:  
I'll loose me a bird upon this Present waste;  
Go trembling song,  
And stay not long; Oh stay not long;  
Thou'rt only a gray and sober dove,  
But thine eye is faith and thy wing is love.

They wave a joyous greeting to the Queen's helpers as they pass, for they too belong to her happy realm.

Still on they go to the brow of a hill. They see the calm waters stretch far below them. Across the water against the sky is a curving line of mountains, all glowing pink and silver: with peaks, like fingers, ever pointing upward, saying: "Be happy, be happy! Look up!" Then begins the steep and rugged descent of the hill to the sea. Merry little rabbits with cottony tails whisk through the stubble hard by; bright-eyed squirrels peep shyly from their holes; and lazy lizards blink on the stones. A yellow-throated meadow-lark hops upon a bush, and clearly chirps his cheerful little note; a mother quail hurries her large brood of downy nestlings across the path; an unseen linnet blithely carols a song as pure and free as a gushing mountain brook; a silver-voiced mocking bird whirrs by singing as he

flies. So the rugged way is ended, and the road dips into a hollow, where a tiny home is hidden. The children run out to wave a greeting, the chickens cluck noisily and the proud strutting rooster crows a welcome. There is a sudden whiff of exquisite fragrance, and orange trees appear, dark shadowy green, all hung with golden fruit and creamy blossoms. High on one side looms a green hillside. Under the shady rocks delicate ferns peer forth shyly. Near them spring up clusters of shooting-stars, lavender and pink tipped like the distant mountains. Farther on the grass is spangled with golden violets, that lift their wee faces proudly to the golden sun. The crimson flowers of the jewel-weed glow like rubies against the green hillsides, which the Indian paint-brushes mark with spots of flame color.

Soon the little green glade ends. Then comes an open space; after that—the sea. Far away across the water is a city, spread like a magic carpet on the shore. To this city the Queen's helpers are going. Floating on the calm blue water is a great sea-bird awaiting them. They mount his broad back, his great heart gives a deep thump thump, and he rises on his wings over the silvery waters. Far below them circle the graceful seagulls; they meet Grandfather Pelican sailing majestically through the air; they hear the flapping of the wild ducks' wings as they skim along close to the water, and the long swishing sound as they glide back to the home they love; they see the watchful long-legged crane fishing near an upright pile. The porpoises and dolphins tumble over each other in sport, like schoolboys playing leap-frog; the small black whale rises to the surface; and seals lift their doglike heads to watch the sea-bird's stately flight. As they near the city, tall masts of ships rise out of the pearly mist, and as the sea-bird poises in his flight, and swoops gently downward, the sound of music is wafted to their ears from the great white man-o'-war resting at peace in the quiet harbor.

Then the enchantment ceases and the hum of the city closes round them. But the Queen's helpers carry the magic in their hearts all through the day as they go about spreading her messages. In the evening the sea-bird comes again, to bear them back, through the golden sunset glow, to the enchanted island.

Would you not like to find your way to this island of enchantment? STUDENT

THE Roosevelt dam, which is now in the course of construction near Phoenix, Arizona, will be one of the greatest dams in the world when it is completed. It is being built across the gorge in the Apache mountains through which Salt River runs. It will fertilize nearly  $\frac{3}{4}$  million acres of desert land, will be 270 feet high and will hold three times as much water as the Assuan dam on the Nile. The 2000 people living in the little town of Roosevelt will have to move away, as the town is in the valley just above the dam, and as the water backs up, the town site will be covered.—*Exchange*

# THE CHILDREN'S HOUR

## After the Rain

THE garden plants had never forgotten the delightful time they had on Century Plant's birthday last summer. Several had wondered if there was not another birthday to be celebrated, but no one remembered his own.

Then the rain came. O, how delicious a feast! Every plant in the garden had his share, even to the tiniest blade of grass.

How they spread out wide their arms in great satisfaction! how they drank and drank the delicious drops! How they bathed their leaves' glossy green! All was silence in the garden except the pouring and the splashing of the warm rain.

The next day when the sun came out he looked on a new world. Why! Could this possibly be the same garden? There were smiles on the face of the driest old bush. The trees with heads a little to one side, held out their arms to the sun saying: "Look how clean we are!" You could not help smiling back at them; they looked for all the world as if they were just straining themselves to keep from laughing aloud.

Little dainty Pink Geranium, who had been so faithful, blooming all through the dry season, stood there smiling with tears of joy in her eyes. There was peace resting over the garden, and the sun beamed. But under the ground there was great commotion. The earth fairies rushed back and forth storing the water. Little rootlets were busy everywhere, planning and whispering. Flowers, flowers, flowers, seemed to be their only thought.

"Friends," said Mr. Yucca Palm, "let us give thanks for this great rain."

"I am with you," said Pampas Grass. "Good idea! How ever came you to think of such a thing, Yucca?"

"O, you know rain has always been very precious to my people, and having lived so long with the Indians in the deserts, we have learned how to be grateful to heaven for the good gift."

Birds were now dispatched to all corners of the garden to tell about Yucca's proposition which was received with great favor.

When all were ready the Meadow-Lark choir sang a hymn so full of grateful thanks that it seemed to all as if their own hearts had had a voice.

Then Yucca said: "Hail to the mighty clouds from which comes the blessed rain! When we see you gathering we rejoice. When we see your brother the sweet gray fog walking over the ocean towards us, we make ready to welcome him. Thanks to the master of the clouds who gave them the sweet water. Thanks to the Sun who lent his sky to the water-clouds. Thanks to the Wind who helped

Lomaland Photo. and Engraving Dept.

PAMPAS AND YUCCA IN THE GARDEN, LOMALAND

to move them hither. Thanks to every little drop who falls on each little blade! We will try to serve by using these gifts, that we may grow to fulfil the purpose for which each one rose from the seed."

Then Miss Mocking Bird with one of her sisters sang a duet called "Ode to the Rain."

"Tell us something more about the Indians, Yucca," said Pampas Grass.

"My ancestors knew and shared the hardships of the Indians and helped them as well as they could. They learned how to get enough water from the dry earth and air to live on, and even grow fruit which they gave to the Indians."

"Father Yucca, what makes rain?" asked Calla Lily.

"Sacrifice, child!" answered Yucca.

"I have heard that the trees made it come," said Yerba Santa.

"I too have heard that," replied Sage. "Yerba Santa and I lived on this hill in the old dry days when there were no Râja Yoga people and no garden here. Once I heard someone say that if we only had trees there would be more rain."

"But Yucca said that rain comes from sacrifice, and he must certainly know," said Calla Lily.

"Well, well, children!" said Pampas Grass. "Let us settle the question once for all. Send one of our birds to the oldest Cactus living in the south cañon to ask him what makes the rain come. Then send another bird to the little round rock in the north cañon, the one which the birds use for sharpening their bills, and let him ask the same question."

All agreed to this, the birds flew off, and after a short time returned.

"What did Old Cactus answer?" asked Pampas.

"When I asked him what makes the rain come, he said: 'The trees, bless their hearts.'"

"What did the round rock say?" asked Pampas. "He murmured, 'Sacrifice,' answered the second bird."

"There is a Râja Yoga girl in the garden," suggested Heliotrope.

"Birds, fly and call her to us that she may be our judge," cried all the plants.

She came and sat among them and they told her about the question which puzzled them. She understood and spoke to them as if they had been her own playmates.

"Some years ago," she told them, "there lived on this hill only Yerba Santa, Sage, and Cactus with their households, and they all looked old and dry. No trees could grow because they died from thirst and heat when they were tiny babies. Then some Râja Yoga people came. They could have lived where the earth was already prepared with beautiful trees and gardens, but they sacrificed that."

"I begin to understand now," said Pampas.

"They planted baby trees and sacrificed time and labor early and late to water the little trees until they had grown big and strong and together could attract the rain. That is also the way in which we Râja Yoga children are taken care of and guided how to grow right, until we are sure enough to do right by our selves. Then we shall help all the people to have the flower and fruit of happy lives. I am so glad to be a Râja Yoga girl." YLVA

# THE MYSTERIES OF THE HEART DOCTRINE

Prepared by  
**KATHERINE TINGLEY**  
AND HER PUPILS

## *The Theosophical book of the Twentieth century*

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1.25 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

Order now from  
**THE THEOSOPHICAL PUBLISHING COMPANY**  
POINT LOMA, CAL.

## **Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY**

## **SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM**

by H. P. Blavatsky and William Q. Judge

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"  
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its *rationale*, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

## The Church Throws a Boomerang

THE extremes to which so-called free-thought goes give occasion for the party of reaction to use some very plausible arguments for their case. But such "free-thought" is not really free, for it has thrown off some of the religious dogmatism only to put on that of current scientific theory.

Thus the head of a dogmatic religious association delivers an address in which he says:

The error I refer to consists in believing that everything, even the most fundamental verities, must be subject to evolution. . . .

To live, these people tell us, is to evolve. Exactly so; but it is also to endure. If we take evolution in its primitive and biological sense, it implies a change; but it also implies something unchanging. In the hypothesis of Darwin . . . we find that the evolution of a species is only intended to effect its conservation; that is to say, to safeguard certain essential organs which can never be changed. (Translation in *Literary Digest*.)

Very well; what are the "fundamental verities" not subject to evolution? Undoubtedly we should find, if we pressed the question, that the speaker included under this head certain dogmas of his church. The fundamental verities may not be subject to change, but man's attempts to formulate them are. We have here the controversy between progress and conservatism; both essential concomitants of our well-being, but each capable of being misapplied in favor of a wrong cause.

The speaker also quotes someone who said that *people mistake the short moments during which they live for an age*. This argument is of course double-edged. For, if it is intended to show that the authority of the medieval church is older and more settled than that of modern speculation, it equally well shows that medievalism is a mere passing phase in comparison with the ages before and after. Let us by all means apply the saying, and compare the brief history of the emergence of modern civilization from the ruins of the past, and its partial recovery of some of the forgotten knowledge, with ancient Egypt, whose monuments and cities, which were tending towards decay even in the time of Herodotus, still strike modern engineers with awe and wonder. Conservatism and tradition may be valuable, but they do not bid us anchor ourselves in the bogs of medievalism. Let the church bring out its past by all means, but we advise it not to dig too deep!

Search all  
History for the  
Manifestation  
of the Divine

Theosophy teaches conservatism of a kind sane and true. But the past to which it looks is older than medievalism, far older than the Christian era. It calls upon man to look back to the great races of old from which he is sprung, and to forecast his own future possibilities by the measure of their achievements. It does not bid man conserve his errors, but points him to a deeper source of truth within himself. That which is changeless in man lies deeper than opinion and fashion of thought.

As an example of an eternal verity to be conserved, let us take the Golden Rule—to treat your neighbor as you would be treated yourself—and it will take us back beyond the church, beyond the alleged Jesus or Jehoshua, to the last Zoroaster, to Gautama the Buddha, to ancient Egypt, as far back as we can reach. It will certainly not warrant us in clinging to any particular ecclesiastical adaptation of the Rule.

The church uses arguments dangerous for itself. It keeps its balance by shifting about from one foot to the other, and its tactics are to harry the enemy's stragglers without exposing itself. STUDENT

## "Try the Spirits"

JOHN'S advice to those of his followers who were beginning to have "messages" and vision was, *Try the Spirits* (1 John, iv, 1). He knew that "messages," proclaiming the recipient's greatness, may come from the recipient's latent self; that visions may be waking dreams whose contents picture only the dreamer's preconceptions and wishes; and that the silliness and vacuity of "revelations" may become perilous when the mystery of their verbiage attracts the worship of ever-ready disciples on the look-out for a mystical sensation.

John may or may not have meant: Try the "spirits"—of others when they utter "revelations" and proclaim "messages" that exalt their recipients and deliverers. If he had been a little more explicit there might today have been fewer charlatans and mouthers in the religious and pseudo-religious worlds. Common sense makes a chilly bath, and if mankind—especially in America—always had it ready for the baby "revelations," their first cry would mostly be their last.

Not necessarily from the soul is everything that comes up from the depths of consciousness; nor, when something is from the soul, is it necessarily unmixed with baser matter, or with arrant folly, by the time it comes clear into the mind. The sub-conscious mind does a lot of work on its own account, espec-

ally if imagination has been trained and encouraged by a cultured intelligence. The *soul* may or may not be using this faculty and apparatus. It has one single aim in its work—human good. That marks the line between real genius, where the soul is working, and the extraordinarily close imitations—which we ought to call talent—so numerous today. The soul, when it is allowed to work at all, is a world worker, using all the instruments at its disposal in the personal make-up and giving that last touch of perfection to their work which makes *genius* of supreme *talent*. The *person*, however “geniused,” is only getting at one with his soul when he accepts, and works by, that larger than personal motive for his work. In testing his motive he is “trying the spirits.”

The Russian novelist Turgeneff, relating something about himself to Mr. Henry James, incidentally threw a good deal of light on all this. Says the latter:

I have always fondly remembered a remark that I heard fall years ago from the lips of Ivan Turgeneff in regard to his own experience of the usual origin of the fictive picture. It began for him almost always with the vision of some person or persons, who hovered before him, soliciting him, as the active or passive figure, interesting him and appealing to him just as they were and by what they were. He saw them, in that fashion, as *disponibles*, saw them subject to the chances, the complications of existence, and saw them vividly, but then had to find for them the right relations, those that would most bring them out; to imagine, to invent, and select and piece together the situations most useful and favorable to the sense of the creatures themselves, the complications they would be most likely to produce and feel.

Now suppose the proper conscious personality to be weak, vain, mediumistic, negative, deficient in judgment, deficient in grip of its proper self-consciousness—and several phenomena become possible.

It may be obsessed by one or more in succession of these false personalities coming up from below, and exhibit sudden changes of character of the most perplexing kind—especially when the true personality has been stunned by hypnotism—or, in those subject to epilepsy, after a seizure.

If the proper personality has the neurosis known as mediumship and believes that the great dead may return as “controls,” the subconscious mind will throw up figures of these dead in any quantity, constructed from whatever the medium may know or have imagined of the originals; and these will talk or orate to the tune of the medium’s knowledge and culture. The last depths of his memory will be explored and multitudes of facts long forgotten—so long that he may think he has never known them—will be revived and woven into the deliverances.

One of these productions, taking a great historic name, and encroaching more and more on its unaware creator’s time and attention and nourished by his vanity and ambition, may be accepted as a memory of a former incarnation. The great dead, like the small ones, do of course reincarnate. But anyone who imagines himself to be one of them would do well to be silent about it even to himself. His greatness will out very well of itself without his own worship of it, and will be recognized

none the sooner for his ostentatious placard and trumpet. Geniuses may also go unrecognized, but they cannot save themselves from that fate by their own proclamations. C.

### The “Fourth Dimension”

A WRITER in the *Scientific American* speaks about the “Fourth Dimension”; and, though he avoids some common mistakes, he does not seem free from fallacy on the matter. The question is well treated by H. P. Blavatsky in *The Secret Doctrine*, (vol. I, p. 251.) In the first place it is wrong to consider the three dimensions as belonging to *space*. They belong to *matter*—or, rather, to one of the properties of matter, namely extension. It would be more correct to say that extension is one of the experiences of the mind when brought into connexion with that mysterious “matter.”

Anything having less or more than three dimensions is not extension at all; so the word “dimension,” if applied otherwise than to the threefold characteristic of extension in physical matter, must have a purely symbolical meaning. Thus, we might speak of forces as being two-dimensional, meaning that they are dual, having action and reaction or being positive and negative; not conceiving them as anything extended, like a line. Or we might speak of anything having four fundamental properties as being four-dimensional; but it would be absurd to give these dimensions a geometrical value.

In this wider sense, matter already has, as H. P. Blavatsky points out, more than four dimensions, but extension can never have more or less than three.

The writer alluded to says that “our experience discloses no objects which possess merely length. Still it is a conception which the mind is capable of realizing by the mental process of abstraction.” This is where the error comes in. We reason from a false premiss. There is no such thing as one-dimensional or two-dimensional extension, except as an abstraction; therefore we cannot use them as arguments for four-dimensions, except as an abstraction.

Using geometry as a symbolism, we can reason by analogy from the properties of threefold extension to those of imaginary higher-fold arrangements. To conclude with a quotation:

So long as there are foot-rules within the resources of Kosmos, to apply to matter, so long will they be able to measure it three ways and no more; and from the time the idea of measurement first occupied a place in the human understanding, it has been possible to apply measurement in three directions and no more. But these considerations do not militate in any way against the certainty that in the progress of time—as the faculties of humanity are multiplied—so will the characteristics of matter be multiplied also. Meanwhile the expression is far more incorrect than even the familiar one of the “Sun rising or setting.” (*The Secret Doctrine*, vol. I, p. 252) STUDENT

It seems that Danish engineers, after exhaustive trials, have reached the surprising conclusion that the old-fashioned windmill with four arms is a far more efficient air engine than any of the modern many-bladed devices. Could the original inventor of the old type have had the svastika in mind? STUDENT

### A Lightning Calculator

THE Society of Anthropology in Paris has examined the case of a wonderful girl calculator, aged twenty, of Greek origin, who worked out almost instantly and by mental process the square of 25 figures, the square root of twelve figures, and the cube root of ten figures. She says each number presents itself to her in a distinct color.

Such cases are by no means infrequent. But suppose they were unknown today and that Herodotus had given a description of one; what would be said of Herodotus? Clearly inexplicability is no disproof of a fact. But then how do we explain the ability to calculate in the ordinary way? We have no explanation that amounts to anything; the only difference between this girl and an ordinary calculator is that her case is the more unusual.

But does not this give a hint that we may have had remote ancestors who possessed such faculties? Does it not indicate the possibility of higher developments of mind surviving sporadically, just as cases of gigantic stature and other traits sometimes survive?

Is it possible that such calculators use the ordinary mathematical processes? Scarcely; it is more feasible to suppose that they have a shorter method. In fact many of them have been ignorant of arithmetic and have had to be taught. Let us always reflect well on such cases whenever we feel inclined to set limits to the possibilities of human faculty, whether in the past or the future. STUDENT

### Californian Indians Knew of Microbes

DISEASE is caused by minute organisms, called microbes, shaped like worms, serpents, rods, etc. which float through the air and settle in the human body.

This is science.

“The Indians describe pain as a small worm-like object that can fly swiftly and invisibly through the air and enter a human being and give rise to sickness.”

This is heathen superstition.

Looked at from an unprejudiced point of view, the two theories seem about the same. But then so much depends on the point of view. The one is held by scientific men, the other by heathen; consequently the one is science and the other superstition.

How did the California Indian know this about the microbes? Did he have a microscope? The medicine man, we are told, has peculiar powers, which he either receives in a dream or inherits. Perhaps these powers enabled him to find out. STUDENT

### A Soundless Room

ZWARDEMAKER has constructed, in his physiological laboratory at Utrecht, a room into which no sound can penetrate. The inner wall is made of tufer, lined with horsehair, the outer wall of successive strata of wood, sand, stone, and plaster. Hence there are six strata of different fairly sound-proof materials, in addition to the air-space between the walls. The top and bottom of the room are constructed in the same manner. . . . Not the slightest sound can penetrate the room from outside. The silence is so profound that a normal ear hears a continuous hum, of physiological origin. . . . A resonator held to the ear gives no sound.—*Scientific American*

## Some Views on XXth Century Problems

### The New Veil

A WELL-KNOWN Methodist Professor, much quoted by Christian Scientists as a supporter of their peculiar creed, has at last risen to deny that he is anything of the kind.

The creed, he says, rests on bad philosophy. Experience is real, whatever metaphysical view you may choose to take as to the unreality of the *cause* of it. If a stone strikes you, there is pain, a real experience, however illusory, transient, or unreal you may consider the stone.

Now this fact is overlooked by a great many philosophers and also by the Christian-Science speculators. They point out that matter is unreal, and then conclude that this unreality in some way affects the experience. . . . Pain is not real as a thing, but is an actual occurrence in experience.

Metaphysics can lead us behind the experience and enable us to make any number of affirmations or denials of the reality of the cause of it, but:

it can never lead us behind it in the way of denying the experience, for experience is both first and last, first as the foundation of our theorizing, and last as that by which the theorizing must be judged.

But the creed in question *does* lead to denial of the experience, and the denial may unfortunately have a half success. It then comes under the head of hypnotic suggestion.

In the records of hypnotism there are some cases of organic heart disease, in which it was suggested to the patient that his heart was healthy and that he would have no more pain. On awaking he so behaved, exerted himself as usual, had no warnings of pain, and dropped dead. The experience had been very well denied, but remained notwithstanding, merely pushed outside the ordinary consciousness.

It would be possible to deny away hunger and then to deny away any sense of exhaustion from the absence of food. But the exhaustion, banished from *conscious* experience, would remain as a practical fact, even leading finally to death.

But more than that could be done by completed denial. A man with disease of the spinal cord could in some cases deny and deny until power of motion came back to his legs and the nerve cells more or less recovered their proper function. By a mental act the cause of the disease has been held back from that manifestation. It has not been met, neutralized and spent out, as it would have been by a successful medicine, system of habit and diet, or what not. It must either try to find other outlet, to be there also dammed back by the same method; or it must remain altogether as a raised trigger held up by a continuous mental act of inhibition.

Two things have happened, both of them subtly ruinous to the mind.

The mind is in a permanently hypnotic state. That is the case during any continuance of any suggestion. The mind has been hypnotized and fooled by being compelled to deny what it knows to be a fact, this particular de-

nial being accompanied by others more comprehensive; or which is the same thing, being compelled to affirm that which it knows to be not a fact.

And it is, additionally, in a permanent state of strain — however unsuspected — constituted by the steady endeavor to hold back disease.

Under this state of things it ceases to think. It is incapable of producing or appreciating literature in proportion to its success in its practice. No body of such people, of whatever size, can possibly produce a thinker or a real literature. Their books will weave and reweave their formulas; their journals relate experiences; they can do no more. They are mistaking a continuous state of emotional feeling, leading only to more of itself, for thought. By repeating "God is Divine Principle" you can lull the mind back from searching thought into vague emotion; but you can never know Divine Thought. You can lull away a bad habit; but it is only asleep, not faced and conquered by an awake and spiritualized will.

Of old, the Church kept men against their will from thinking; this thing stops the *will to think*. The veil is sweetly colored; the deluded hold it up before *their own* eyes and call it — not a picture of heaven but — heaven itself.

H. CORYN, M. R. C. S.

### "Taking Thought"

"IS it not time to pause and take thought?" asks a writer in a monthly contemporary, after an examination of the death-rate from suicide and violence. He does not seem to know exactly what sort of thought to take; but his figures are very clear and definite.

During last year nearly 11,000 persons committed suicide. Divide the number of people who, out of a thousand of the population, last year committed suicide, by five; add this fifth part to the original number, and you will have the number, out of the thousand, who will this year do it. That is the average rate of increase during the forty years 1864-1904. But it is getting swifter. Since the beginning of the century it has mounted in the ratio of 2.5 to 3.4. In one State the rate during the first half of 1907 was 55% greater than in 1904! In one city, Chicago, the growth between 1880 and 1900 was 85.5%!

Crimes of violence are increasing in about the same proportion. And so are deaths from *preventible* injury.

Pneumonia, cancer, heart diseases, diabetes, and diseases due to vice, are also increasing.

All these causes fall into one single picture. Pneumonia is pre-eminently the disease of the half-starved. Cancer, heart disease, and diabetes, have worry either as primary or as contributing cause, or as cause of death from them once that they exist. Deaths from preventible injury mean *callousness* somewhere.

The suicide and the murderer are not isolated phenomena. They but carry to an extreme and active point the tendencies which in others exist in less degree, and they are increasing. The callous railway official who will

not have safety devices put into use because of their cost and because human life is cheap, is no isolated brute. He is the same sort of man as the average passenger. If there were more brotherhood it is clear that there would be more safety devices, less worry, less grasping, less competition, easier life, and therefore fewer cases of cancer, heart disease, diabetes and pneumonia; fewer crimes of violence.

What about the suicides? Their cause is very clear. They reach a maximum during panic times. When the panic is over there comes a minimum, but not so low a minimum as the last one. From this minimum they begin to increase with increasing prosperity until a (higher) maximum comes with the next panic. So increasing prosperity is not increasing *general* prosperity; the screw is ever tightening somewhere in some ratio with it; and from those upon whom it is tightening come the suicides. They are victims of that general and, obviously, increasing spirit of grasp which, doubtless, they themselves share in their proportion. There is little or no — there is steadily less — spirit of general helpfulness, of brotherhood, in the air to warm them and save them at the moments when consciousness is at its chilliest.

If all these things are increasing, must not brotherhood be decreasing? And must not that mean that the spiritual life is getting weaker? Having run the cause down, we can \*pause and take thought."

It is only Theosophy that can save the situation, illuminating Christianity with new light, really Christianity's own old light, but nearly lost and forgotten these many centuries. The light cannot now be brought back to it by efforts made exclusively from within its own borders. The semi-external aid of Theosophy must and will be given — a help, however, possible because of inner identity.

Christianity, as we have it, teaches brotherhood. It does not, as we have it, teach that because of inner human unity a brotherly state of feeling, energized by will into a series of acts and thoughts, widens out all over the field of life. Its beneficent touch as it passes may just suffice to hold some intending suicide back from his act.

STUDENT

### Selecting the Evidence

AT an Eastern Medical College, some investigations are under way into the brain of a recently executed murderer with a view to finding a deformational cause of his brutality.

In all such cases it is a cry from materialism: Heads I win, tails you lose; for:—does the brain compel the man? Here is a deformed brain and the man was a murderer. This case "clearly shows" that man's consciousness is dominated by his physique and there is no such thing as responsibility.

But, here is a murderer whose brain is in every way excellent. How now? *Nothing!* Isolated cases do not count. If we could look closer we *should* find something: "Therefore" — conclusion as before.

STUDENT

# Archaeology Palaeontology Ethnology

## The Mayas: Some Neglected History

IT seems strange that archaeologists should be giving so much attention to the remains of lowly nomads and settlers on this Continent, and other archaeologists be studying the ancient civilizations of the northeastern corner of Africa, when:—

The country known today as Yucatan, one of the States of the Mexican confederacy, may indeed be justly regarded by the ethnologist, the geologist, the naturalist, the philologist, the archaeologist, and the historian as a most interesting field of study. Its area of seventy-three thousand square miles, covered with dense forests, is literally strewn with the ruins of numerous antique cities, majestic temples, stately palaces, the work of learned architects, now heaps of débris. . . . Among these the statues of priests and kings, mutilated and defaced by the action of the elements, the hand of time and that of man, lie prostrate in the dust. Walls covered with bas-reliefs, inscriptions and sculptures carved in marble, containing the panegyrics of rulers, the history of the nation, its cosmogonical traditions, the ancient religious rites and observances of its people, inviting decipherment, attract the attention of the traveler. — Le Plongeon, Introduction to *Queen Máo and the Egyptian Sphinx*.

About 522 A.D. the country was invaded by the turbulent and barbaric Nahuatl, and the books containing the record of the ancient traditions and the history of past ages were carefully hidden by the priests who had charge of the temples and libraries. The cities were destroyed, the people wandered, and the arts and sciences decayed; the kingdom was dismembered by civil war. Then the ancient lore was forgotten and disfigured; and, ingrafted with the superstitions of the Nahuatl, it assumed the shape of myths. Scholars who have studied these nature-myths, and know nothing of their origin, being apparently so unread as not to be aware of the existence of an ancient universal language of symbology, have tried to represent them as the efforts of primitive man to evolve a religion out of nature.

New books being written to replace the lost libraries, the myths were perpetuated in their altered forms and in a new but ruder pictorial script, while the knowledge of the hieroglyphics on the walls was lost to the people in general.

This ancient people, like the Egyptians and others, were heirs of that great knowledge of which we can find the proofs everywhere: the Science of the great races that peopled the sunken continents — races which diffused themselves in all directions upon the new continents as the old continents disappeared. This is why their calendar, religious symbology, and many other things are so similar to those found in the Old World among the Egyptians, Hindûs, Chaldeans, and other ancient races.

The word "Maya" itself is universal, being found in the Hindû and Greek systems for instance, and meaning the Universal Mother, the Great Deep, the Waters of Space, and so on.

It is surprising how many references we find from classical sources to the existence of vast lands to the west of the Pillars of Hercules. Says Le Plongeon (*op. cit.*):

In the classic authors, Greek and Latin, we find frequent mention of the great Saturnian continent, distant many thousand stadia from the Pillars of Hercules toward the setting sun. Plutarch, in his "Life of Solon," says that when the famed Greek legislator visited Egypt (600 years before the Christian era), Sonchis, a priest of Sais, also Psenophis,

the landscape is varied by very lofty mountains, and the temperature is always soft and equable." Procopius, alluding to it, says it is several thousand stadia from Ogygia, and encloses the whole sea, into which a multitude of rivers, descending from the highlands, discharge their waters. Theopompus, of Quio, speaking of its magnitude, says: "Compared with it, our world is but a small island"; and Cicero, mentioning it, makes use of nearly the same words: "*Omnis enim terra qua colitur a vobis parva quaedam est insula.*" Aristotle, in his work, "De Mirabile Auscultatio," giving an account of it, represents it as "a very fertile country, well watered by abundant streams"; and he refers to a decree enacted by the Senate of Carthage toward the year 509 B.C., intended to stem the current of emigration that had set toward the Western lands, as they feared it might prove detrimental to the prosperity of their city. The belief in the former existence of extensive lands in the middle of the Atlantic, and their submergence in consequence of seismic convulsions, existed among scientists even as far down as the fifth century of the Christian era. Proclus . . . says: "The famous Atlantis exists no longer, but we can hardly doubt that it did once, for Marcellus who wrote a history of Ethiopian affairs, says that such and so great an island once existed, and that it is evidenced by those who composed histories relative to the external sea, for they relate that in this time there were seven islands in the Atlantic sea sacred to Proserpine; and, besides these, three of immense magnitude, sacred to Pluto, Jupiter, and Neptune; and, besides this, the inhabitants of the last island (Poseidonis) preserve the memory of the prodigious magnitude of the Atlantic island as related by their ancestors, and of its governing for many periods all the islands in the Atlantic sea. From this isle one may pass to other large islands beyond, which are not far from the firm land near which is the true sea."

Plato's "Atlantis" was only a remaining fragment of the actual continent of that name, which latter disappeared long before. Though there doubtless was communication between the Old World and the New T. in comparatively late times, across surviving islands, it is not to be inferred that this was the origin of the Maya civilization, nor that the Old World derived its civilization thus from the Americans. The connexion dates back much further, to times when there was one race with a common civilization.

A new conception of history is needed, to accord with our advances in other sciences. Our contracted ideas agree neither with a worthy estimate of human nature nor with geology and astronomy. Are the records lost? So at one time were those of Greece and Rome; and our knowledge of those of Hindustan is still recent and partial. There are plenty of records ready for us when we are ready for them; and as they were caused to disappear from the reach of abuse, so they can again in due time appear. STUDENT

SYMBOLIC RECORD OF THE NAHUATLS OF MEXICO

ONE of the pictures in the so-called "Codex Fejervary-Mayer," now in the Liverpool Free Public Museum. The codex is painted on four strips of parchment pasted together into a strip 12½ feet long. Its symbology, which is at once astronomical, chronological and theogonical, bears witness to the fact that its ancient authors preserved some of that Divine Science which the Egyptians, Chaldeans and Hindûs have also preserved, deriving it from its common source — the Wisdom-Religion of Antiquity.

a priest of Heliopolis, told him that 9000 years since the relations of the Egyptians with the inhabitants of the "Lands of the West" had been interrupted because of the mud which had made the sea impassable after the destruction of Atlantis by earthquakes.

The same author again, in his work, "De Facie in Orbe Lunae," has Sylla recount to his brother Lamprias all he had learned concerning them from a stranger he met at Carthage returning from the transatlantic countries.

That the Western Continent was visited by Carthaginians a few years before the inditing of Plato's "Atlantis," the portraits of men with long beards and Phoenician features, discovered by me in 1875, sculptured on the columns and antae of the castle at Chichen, bear witness. Diodorus Siculus attributes the discovery of the Western Continent to the Phoenicians, and describes it as "a country where

# ✻ The Trend of Twentieth Century Science ✻

## Doings in the Glacial Epoch

THE relatively savage condition of palaeolithic—pre-glacial, just post-Tertiary man, the man anteceding our own quaternary or Aryan period, has hitherto been taken as representative of that of the then man as a whole wherever he lived. It has been assumed that from him we have gradually made our ascent. Long ago H. P. Blavatsky gave a warning against the inference, pointing out that then, as now, savage and civilized man coexisted. Commenting upon the resemblance of palaeolithic stone hatchets and those in use among savages of today, she remarked:

This goes to prove that there have been savages at all times; and the inference would be that there might have been civilized people in those days as well, cultured nations contemporary with those rude savages. . . . The rude workmanship of the Palaeolithic tools proves nothing against the idea that side by side with their makers, there lived nations highly civilized. (*The Secret Doctrine*, Vol. II, pp. 716-7.)

These highly civilized nations were, according to Theosophy, Atlantean.

The tide is turning, and civilized man is beginning to be permitted alongside of the savage. In *Records of the Past*, the editor, Professor Wright, says:

Comparing now the chronology of the human race in the Euphrates Valley, and that of glacial man in Northwestern Europe and in America, it would appear that they were for a time contemporaneous; and that the human race presented about as great extremes in culture then as it does now. With the exception of various labor-saving inventions, which have been made within the last three or four centuries, the civilization in ancient Babylonia was as far above that of contemporary Palaeolithic man, living on the borders of the ice-fields in England and America, as that of Europe is above that of the Eskimos, who live upon the borders of the Greenland ice-fields. Substantially the same differences in culture existed then as exist now.

This seems to introduce him to a doubt as to whether we have, after all, advanced so very much since then.

Considered in its total result the progress of mankind has not been by any means so great as it is popularly represented to have been. Ten thousand years ago [he might have used much larger figures] the human race possessed all the leading characteristics which it possesses at the present time. There were centers of high civilization in favored localities, and there were wide areas of barbarism and savagery, where man barely maintained his existence through a desperate struggle with the conditions of life. The same is true today, only the centers have shifted and some races have come into possession of knowledge, enabling them to control the forces of nature for certain purposes much more completely than ever before [upon the last six words Theosophy would have some comment to make] but a large portion of the human race is still carrying on the struggle while in possession of only the most primitive means of culture.

The writer, as does current geology, greatly foreshortens the post-glacial period. But, if

we make that correct, we find him indicating two important facts.

First: that while Europe and North America, with Russia, were under the hand of the glacial epoch, Central Asia was not. On the contrary, it became more fertile.

Now around the base of the Thianshan Mountains, there is an area many times the size of Egypt, whose life depends upon innumerable streams—large and small—which bring down their supplies of water in due season from the heights where it has been detained in unfailing cold-storage reservoirs. . . . It is interesting to learn that this very region, which is the traditional center for the dispersal of the human [read Aryan] race, and in which, beyond all reasonable doubt, the Aryan races had their original home, has recently been found to be an important center of pre-historic man.

Atlantis was sinking and some of its outlying peoples were pressing westward into America. But Canada and the northern part were under the glacial hand. As it withdrew, the melting ice, as Professor Wright points out, gave rise to enormous floods, of which there are many traces:

Local floods of enormous extent during the closing stages of the epoch seem to have been connected in a marked degree with the destruction of both man and animals, which took place during this epoch. The remains of man, which have been found within the last few years in the loess of the Missouri valley, are connected with annual floods, which can be definitely proved to have risen 200 feet.

May not the cliff dwellers have built their houses high in the cañon sides in order to guard against these floods, and *not* perhaps for military defense? While nascent Aryan man was having a good time in the fruitful Central Asian plains, the fringe of Atlanteans—if the cliff-dwellers were that and not later—had to be establishing homes and fighting floods just under the nose of melting glaciers. Further south, in Central and South America, civilization, having an easier time, reached much higher levels.

## The Chemistry of Holiness

WE now know the chemical formula of the odor of sanctity. It is  $C_8H_{12}O_2$ .

A famous French chemist has been examining the innumerable legends from all countries and times and creeds, of saints whose bodies exhaled sweet odors either after death or, more rarely, during life. According to his article in *La Revue de Paris*, the saintly odors are comparable to those of violet, pineapple, musk, benzoin, amber, canella, cloves, orange lily and rose.

M. Dumas, the chemist in question, does not doubt the legends; the perfumes were genuine, but—were due to disease! The chief fact upon which his inverted pyramid rests is that in cases of diabetes the blood may contain a gas known as acetone, and the scent of this is often to be detected in the breath.

In cases where the nutrition is checked, acetones and fatty acids may be generated. These, entering into union with aldehydes and acetous aromatic

derivatives of alcohol, give rise to the perfumes of the orange or violet, or it may be to those of canella or musk. Butyric ether, with a little bicarbonate of soda, will yield the odor of pineapple.

The Persian, Scandinavian, Indian, Christian and other saints may have had their share of maladies. But we want a set of cases of *ordinary* persons, not of special sanctity of life or elevation of soul, victims of the same maladies, whose entire bodies after or before death were notably and genuinely aromatic. No such cases have ever been reported. The occasional sickly odor of the diabetic breath, remotely comparable, with the aid of strong imagination, to that of the pineapple—coupled with the scents that can be developed in *test tubes* by mixing chemicals which when found in the body are marks of disease, do not constitute any explanation of the phenomenon.

A habitually rapt and spiritual consciousness does react on the body, profoundly differentiating it from that of the grosser-minded, grosser-habited person and producing emanations which may occasionally appeal to the sense of smell as an aroma, to the sight as a faint light, an "aura" or halo, or to a deeper sense as a feeling of moral purity. STUDENT

## The Martian Problem

THE Martian problem is certainly becoming no simpler. According to current opinion the atmosphere, if there is one, must be very rare and extended. For gravity is only about one third of what it is on earth. Astronomers are also mainly agreed that it would be a dry atmosphere, and that because the planet is further from the sun than we, and because, as they think, it is older than the earth, it is very cold—22° F. below zero. But they are also more or less agreed that the snow caps annually melt—which the assumed temperature would render impossible. Moreover as even snow is slightly volatile, it remains to be explained why the caps have not gone off into the atmosphere, if there is one, or made one if there was not; and why there never seem to be any atmospheric clouds.

According to a recent announcement from Lowell observatory, there is an atmosphere very rich in water vapor. If so, it would act like the glass of a conservatory, letting heat in but preventing its return. The planet's surface must therefore be warm. But a warm surface very rich in covering water vapor, which must frequently fall in rain, is not consistent with the other theory from the same source—that the planet is drying up and that a vast system of irrigation conducted through the "canals" is necessary to run the melting snows over the lands. Water vapor, and that function of the "canals" seem to be mutually exclusive. So the matter now stands.

From a philosophical point of view it is not so very important. While believing that life exists everywhere, the philosopher will not demand that it shall be everywhere the same. The argument for the habitability of other planets gains nothing from their likeness to ours, nor *vice versa*. STUDENT

## Nature

## Studies

*The St. Pietersberg*

THE Hill of St. Peter has been quarried from very olden times for the sake of the tuff, which is used as building stone. For this reason the rock is honeycombed with innumerable passages, forming a labyrinth unsafe to enter without a guide.

The rock is of great archaeological interest, owing to the number of fossil plants and animals found in the tuff. There are a great variety of algae and remains of pines and cypresses; and the visitor is shown a very large tree-trunk, petrified into a gray flint, a thin slab of which shows under the microscope the most intimate texture of the wood. Among the molluscs, corals, and other marine fossils, must be mentioned one discovered in the 18th century — the Maas lizard, *Mesosaurus Hoffmani*, which had a head measuring 1.4 meter in length.

STUDENT

*Quarrying a Sacred Rock*

AN Indian exchange prints a protest against the quarrying of a certain sacred rock or small hill, which is being carried on by people to whom the rights have been sold. The writer gives a quotation from the Old Testament to show that even in Christianity, there is warrant for regarding some hills as sacred; and speaks of the veneration with which certain rocks have been regarded by various peoples at all times. This particular rock is venerated, not only because it is regarded, from its shape, as a sacred symbol, but also on account of the many sacred sculptures on it, the originals of which have, as the writer says, "incarnated themselves into the rock."

Whatever may be the merits of the case as regards this particular rock, there is certainly a great want of recognition in the present day of the sanctity of natural objects and spots, and too great a tendency to look at all nature from the industrial and "utilitarian" point of view. The idea that certain places were centers of special benefic influences is found in all antiquity; but nowadays our ideas seem to be confined to the hygienic and artistic influences only. Nevertheless there are Nature influences more refined than the merely physically salubrious ones; but to these we are insensitive. Moreover there is too much of the spirit of covetousness and exploitation abroad to allow us to treat such places with proper respect, if we did recognize them. At the opposite extreme we find people in whom the

## THE ST. PIETERSBERG, PROVINCE OF LIMBURG, HOLLAND

ancient knowledge has degenerated, not into scepticism, but into superstition, associated with religious fanaticism rather than with any actual knowledge.

Rational science recognizes that different places have different qualities due to climate and soil and exerting different influences on the human body. If science extended its domain, it might discover that places also have still finer qualities influencing the moral and

of appropriateness as regards location, and to adapt the face of Nature forcibly to the purposes of one's proposed habitation or factory, driving away any gods or nature-spirits that may have had their haunts there. A more refined and educated instinct would lead people to try to come into touch with Nature with a view to ascertaining how far they might collaborate with her and adapt themselves; and thus they might preserve many advantages which they now miss.

Undoubtedly, too, it is true that there are spots in the world where the influence is peculiarly favorable to self-communion and to search for the Truth; in which case we have something to learn from the ancient Greeks and even the modern Red Men. STUDENT

*A Colorado Coal Field*

THE Book Cliffs coal field, says a Geological Survey *Bulletin*, is part of an immense basin in western Colorado and eastern Utah around which the outcrop of coal-bearing rocks can be traced for more than 500 miles. On the southwest, from the vicinity of Mount Hilgard, Utah, northward to Castlegate, the coal-measures form the eastern escarpment of the Wasatch Plateau. They trend thence southeastward to Grand River, constituting in the Book Cliffs the southern rim of the Uinta Basin. Beyond Grand River the coal-measures continue eastward, forming the southern base of Grand Mesa and extending to the vicinity of Crested Butte. From that place the outcrop trends northward, and crossing the Grand River again near Newcastle, continues northward along the Grand Hogback to the Danforth Hills. Thence the coal-measures turn westward and crop out along the southern flank of the Uinta Mountains. This field, which has hitherto been but little explored, contains an immense coal reserve for the future.

### A Great Example

REPRINT FROM *Universal Brotherhood*, VOL. XIV, NO. 1,  
APRIL 1899

**I**N the month of November, 1682, took place one of those events in history which has been placed on record and called again and again to memory, as one of the most momentous of the series which have placed the American continent in the van of human progress. It is commonly known as William Penn's treaty with the Indians.

The author of this treaty, and the founder of the State of Pennsylvania, was the son of Admiral Penn, an officer in the English navy in the days of Charles II. After the usual liberal education of an English courtier, and a subsequent tour through Europe, young Penn gave his father much anxiety by a refusal to join in the profligacies of the court life, and later, becoming convinced of the truths which lay hidden in the inner life, he joined the Quakers, who, in those days at least, represented in England the most advanced tenets of true human progress. His great work, *No Cross, no Crown*, may be read with interest by those who wish to study true religion, as it was understood by these good men two hundred years ago.

Admiral Penn had loaned to the needy Charles II. the sum of £16,000 (\$80,000), which, needless to say, that monarch was both unwilling and unable to pay. This debt was inherited by the son who accepted in payment a large tract of country in the New World. Thither he emigrated with a number of his friends and their families to found the colony which was named after him—the City of Brotherly Love (Philadelphia) for its capital.

No one was better aware than the founder that in releasing his monetary claim upon the British government he received an empty title, a title based neither on conquest, nor occupancy, nor discovery. Indeed, this title was made wholly valueless within a century by the settlers themselves. He knew also that the title of the Indians to the land was neither initiated by the exclusive occupancy of one tribe, nor completed by the expenditure of labor upon the ground; but existed only in the vagrant holding of whatever tribe held temporary advantage over another. Yet he finally succeeded in satisfying every one of these Indian titles.

Thus the land itself was without value until made valuable by the labor of his followers, to which heart and purpose was given by the humane direction of the founder. From which it resulted, as it does always in the most valuable work for humanity, that everyone received compensatory advantages except the founder, who was himself brought to ruin by his wise and honest endeavor, and his whole establishment finally lost to his family.

Let us try to picture the scene of this mem-

orable treaty. The place was Shackamaxon on the Delaware River, now a portion of one of the wards of the City of Philadelphia. It was then the site of an Indian village and a noted place for conferences of the Indian tribes. An elm tree stood there, which was preserved thereafter by the Colonists and British soldiers throughout the Revolution.

Three nations of the aborigines had their representatives in the assemblage: the Delawares, the Six Nations, and the Shawanese. The founder was accompanied by members of his council and by his Swedish interpreter, Captain Lasse Cook. Some Swedish and Dutch settlers were also there, drawn either by interest or by their curiosity.

In the center of a wide expanse of green-sward stood the old elm tree. On one side was the sloping bank extending down to the sandy margin of the river, and near the shore lay the Governor's barge.

Behind was the forest which covered what is now the site of the city, walnuts, chestnuts, oaks, elms, beech trees, cypress and pines, reaching backward to the Western horizon—the forest walls of this wide amphitheater. Near the great elm the council fire was blazing; its pillar of cloud rising through the hazy slumberous atmosphere, a witness between the heaven and the earth of the unbroken faith pledged there, and to endure.

Beneath the wide spreading shadows of the elm, the leaders of the tribes were gathered. No warlike weapons were in their hands. In front were the old chiefs and their councillors; behind them, the younger braves, circle after circle, widening outward towards the West, and with them aged matrons and children. In the center of the assembly was Tamanen, Sachem of the Delawares, who, tradition says was in the highest degree endowed with wisdom, virtue, prudence, charity, affability, meekness, hospitality, in short with every good and noble qualification that a human being may possess. He was supposed to have had intercourse with the great and good Spirit; for he was a stranger to everything that was bad.

The Indians, dark to blackness by their ruder intercourse with the weather, were gorgeous with various dyes upon their persons, and with feathers of the forest birds upon their foreheads, shimmering in the autumn sun. The Dutchmen with their pipes and imperturbable repose, in the well worn clothes of their voyage, and the Swedes in their frocks and trousers and moccasins of deer skins, formed an admirable contrast. The immediate followers of the founder were in the quaint costumes of their time—coats reaching to the knees, covered with buttons, most ample vests, trousers slashed at the sides and tied with strings or ribbons, perukes and low shoes. In the midst, the founder, his hair parting in many ringlets over his broad forehead and shoulders; the ruffles of the times falling over his fair hands, in his costume distinguished only from others by a sky-blue sash of silken net, himself the cause and force of that event which should survive by his faith and confidence in humanity to the latest generations.

So they stood together, the passing and the coming race; the race that should perish and the race that should survive—upon this carpeting of the fallen leaves, whose crimson, green and gold arabesques were fading into

the somber dyes of the November days—beneath that tree whose vast embrace and century growing arms were yielding insensibly as themselves to inevitable decay; the waning year, the dying leaves presaging the future of all their forest strength and painted glories. Of all these Penn alone survives in common memory. In stature, tall and athletic; in manner, courteous; in disposition, most resolute; "tender of every person and thing that had simplicity of truth or honesty for a foundation."

He advances toward the council fire with kindly, courtly dignity; his attendants precede him bearing presents which they lay upon the ground. The venerable Tamanen rises, advances a few paces, and puts on his head a chaplet into which is twisted a small horn, the symbol of his authority. By this custom of the Delawares the spot has become sacred, the person of everyone there, inviolable. He then devoutly turns his Calumet to the heavens and the earth, seats himself on the ground and smokes awhile in silence. The interpreter announces that he will hear the words of the White Father. Penn addresses them in these sentences, some repeated as his language long afterwards by the Indians themselves, some as they appear in the stories of his life:

The great spirit rules in the heavens and the earth. He knows the innermost thoughts of men. He knows that we have come here with a hearty desire to live with you in peace. We use no hostile weapons against our enemies—good faith and good will towards men are our defences. We believe you will deal kindly and justly by us, as we will deal kindly and justly by you.

He then read them the conditions of the league, which were preserved by his successors. He then continued:

We will not be to you as brothers—brothers sometimes contend with brothers. We will not be to you as fathers with children—fathers sometimes punish their children. Nor shall our friendship be as the chain that rust may weaken, that the tree may fall upon and sunder. We will be as one heart, one head, one body, that if one suffers the other suffers; that if anything changes the one, it changes the other. We will go along the broad pathway of goodwill to each other, together.

They listen to the words in silence as was their custom, they consult among themselves, they deliberate. Tamanen orders one of the chiefs to answer, and he rises and salutes the founder and takes him by the hand, and says that "he was ordered by the King to speak, and that now it was not he, but the King, who spoke, because what he should say was in the King's mind." He then said that it was the King's mind that these pledges should be accepted, and kept by them forever—and that both races should live in love together, as long as the sun gave light in the heavens. He delivers into the founder's hands that Wampum belt, which was thereafter transmitted as an heirloom to his family, and may now be seen in the rooms of the Historical Society of Pennsylvania.

The conditions of the league—the pledges of that memorable treaty—the links of the enduring chain, that the fallen tree broke not, are preserved in the archives of the State. The words of the final pledge are as follows:

We will transmit this league between us to our children. It shall be made stronger and stronger, and be kept bright and clean without rust or spot.

between our children and our children's children, while the creeks and rivers run, and while the sun, moon and stars endure.

And at every pledge, that great assemblage of kings and braves, standing among their women and children, repeated it in their language, shouted, "and in their way said Amen."

Yet there have not been wanting men who have questioned this inspiring story. They have said, as was said before, that humanity in its credulity and dependence upon such noble examples had created it out of their own imagination, and thus the unbelievers have sought to set aside the simple truth of the tradition, and its lesson has been lost to their narrower scrutinies. But none the less has the story been repeated from generation to generation and preserved "in the credence of our common humanity."

Voltaire speaks of it thus: "It is the only treaty which has not been sworn to, and which has not been broken." Abbé Reynal in his *Histoire Philosophique*, 1780, says:

Never, perhaps, had virtue inspired legislation more conducive to human happiness. Opinions, sentiments, and manners, corrected what was defective, and supplied what was imperfect.

The prosperity of Pennsylvania was therefore very notable. That Republic without wars, without conquests, without effort, without any of those revolutions which astonish the eyes of the inquiet and passionate, became a spectacle for the entire universe.

His neighbors, in spite of their barbarity, were enchained by the sweetness of his manners, and strangers, in spite of their corruption, rendered homage to his virtues. Every nation wondered to see, realized and renewed, the HEROIC AGE OF ANTIQUITY that the manners and laws of Europe had made seem fabulous.

Contemporary history confirms all this, inasmuch as it establishes that throughout all the wars of retaliation by which the Indian braves sought to resist the oppression and injustice dealt out to them by neighboring States, the peaceful colony of Pennsylvania ever remained unharmed, and the Indians ever held in grateful remembrance the memory of "the good Onas," as they called the founder.

And so once more it is desired to call to our remembrance this great event of two centuries ago, that in these days of the dawning of the light of Brotherhood over the world, men may everywhere be encouraged by it to step forward without fear, and in confidence of that which is the common inheritance of our common manhood—the Heart of Peace and Good will to all mankind.

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

### Question

What view do Theosophists take in regard to Quakerism? And what explanation does Theosophy give of its teachings?

### Answer

Before directly answering this question perhaps it may be helpful to say a few words as to the history and teachings of Quakerism.

George Fox, the founder of the Society of Friends, (or Quakers as they were scoffingly nicknamed by a hostile judge during the early persecutions) was born in 1624 exactly 300 years after Wycliffe's birth. In speaking of his boyhood he afterwards declared: "When I came to eleven years of age I knew pureness and righteousness; for while a child I

was taught how to walk to be kept pure." He is described by a contemporary writer as civil beyond all forms of breeding, tender, compassionate and pitiful, a man that God endued with a clear and wonderful depth, a discernor of other's spirits and very much a master of his own.

The positive element in Fox's teaching was that men ought to give earnest heed to the Inner Light—the light of Christ—which God had placed in every human heart. He regarded the work in which he was engaged as in no wise the founding of a new sect or society. His testimony was that of the possibility of an inner revelation in the soul of man. Some of his most celebrated Quaker friends and contemporaries were Robert Barclay, William Penn and Thomas Ellwood.

The followers of Fox called themselves "Children of Light," and at first there was no attempt at organization. When this occurred later, it met very considerable opposition.

The best known work of William Penn is entitled *No Cross, No Crown*. In this book he speaks of the necessity of an inner life of self-denial as essential to spiritual enlightenment, and cites many examples to prove that the spirit of Christ was abroad in the world before the advent of the Nazarene teacher. To the question, "What is the Cross of Christ?" he replies, "The Cross of Christ is the Cross mystical," and then proceeds to elaborate the statement.

Robert Barclay in his *Apology for the true Christian Divinity* says:

The one baptism is a pure and spiritual thing, to wit, the baptism of the spirit and fire. The communion of the body and blood of Christ is inward and spiritual, by which the inward man is daily nourished in the hearts of those in whom the Christ dwells.

The protest of the early Quakers against the corrupt morals, insincerity, and ecclesiasticism of their day, was one phase of the wave of Puritanism which swept over England in the Seventeenth century. The dress which in later times became peculiar, because antique, was at first the plain dress of the people of the time without unnecessary display. They worshiped in silence because they believed that no form of worship was so good as a patient waiting upon God in silence

by such as find no outward ceremony, no observation, no words, yea not the best and purest words, even the words of Scripture, able to satisfy their weary and afflicted souls.

They ever protested against a paid ministry as opposed to the spirit of true religion, contending that no mediation is possible between the soul of man and the divinity within.

In works of humanitarian philanthropy the Quakers have always been active. The reform of the English Prison system by John Howard and Elizabeth Fry; of the treatment of the insane by Dr. Tuke; and the constant efforts of Quakers for the abolition of the slave trade and of slavery are matters of history.

Lord Justice Sir Edward Fry, who lately represented the British Government at the Hague Conference, and a prominent member of the Quaker body, thus speaks of them:

The most characteristic doctrine of Quakerism is undoubtedly this: that there is an immediate revelation of the Spirit of God to each individual soul, that this light is universal, and comes both to the heathen and the Christian, and thereby the love

and grace of God towards mankind are universal.

Sir Edward Fry also says:

One peculiarity of the conduct of Friends down to the Revolution of 1688, and more or less down to the present time must not be overlooked. They were essentially non-political. They opposed the most dogged personal and individual resistance to what they thought wrong; but they never attempted by combination or otherwise to exert political influence. "Keep out of the powers of the earth," was Fox's exhortation; and when in 1688 a discussion was introduced into the yearly gathering of the body on the choice of parliament men, Fox strenuously opposed the introduction of politics into the meetings of his followers.

About the beginning of the Nineteenth century the materialistic and paralysing ideas of Evangelicalism began to make inroads in the Quaker body. The terrible doctrine of vicarious atonement was accepted by many of them, and the division grew until unity finally became impossible. In Walt Whitman's prose writings he has described the celebrated sermon by Elias Hicks which led to the final division of the Quakers in the United States. In speaking of the crucifixion upon Calvary, Hicks declared that "the blood of Christ had no greater efficacy than that of bulls and of goats." From that time the Quaker body was finally divided into two camps, a large number of them forsaking the essential principles laid down by their founder.

The student of Theosophy cannot fail to recognize the spirit in which Fox exemplified his belief in the dual nature of man as explained in Theosophical teachings. The ideals of this really great man were very largely in accordance with Theosophy. The endeavors of the early Quakers to both *preach* and *practise* a simple and earnest spiritual life, is worthy of our heartiest sympathy and appreciation. Three hundred years ago the time had not come for the revelation of the *philosophy* of the Wisdom-Religion which enables us now more fully to understand the true foundation of Fox's inspiration. It is difficult to over estimate the devotion to the inner urge which led him to forsake his family and enter upon his thankless task. The purity of his teachings and his humanitarian ideas have had a potent influence upon civilization, and if in later years the peculiar dress and manners of the Quakers became a kind of fetish, yet they have generally been distinguished from their neighbors by a devotion to their fellow men, and an unswerving integrity which has raised them to a high estimation among the people. If the special mission of Quakerism and its mark upon the age is now largely accomplished, it has still left a legacy of enlightenment which will go down into the future; for no efforts of this kind can be made without an endless ripple of effect which endures into the eternal future.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY is founded upon a broad spiritual basis of which early Quakerism was one faint premonitory echo among many others. Many of its members descend from Quaker heredity. One of these has very truly said that he finds in Theosophy only an extension of previous beliefs, a philosophy which explains and interprets and makes clear the aspirations of his forefathers for the inner spiritual life.

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## What the Christian Clergy- men Are Saying

### That Science Supports Christianity and Supplants It

WE read that the plan of certain German thinkers to organize a new "religion" to replace Christianity has stirred up an opposition party among the scientists to support Christianity's claims. The former party is called the "Monistenbund," and is led by Haeckel, and the scientific defenders of the faith are called the "Keplerbund," in honor of Kepler.

The Keplerbund is not a theological, but a scientific, society. It held a convention and published an *Aufruf*, signed by 214 savants. It protests against the idea that a "fair and unprejudiced study of nature calls for a denial of the fundamental teachings of Christianity, such as a personal God, the fact and consequences of sin, and a redemption through a divine Savior"; and declares that monism assumes its teachings as a result of pre-conceived antichristian philosophy, accepted *a priori* and not proved by science.

Christian apologetics are being modernized in the best sense of the term; apologetic writings are being published in large numbers; and the University of Leipzig has established a chair of Apologetics.

### That Free Thought is Necessary

The *Christian Commonwealth*, London, recommends "a consecrated boldness" and "an indifference to results" as against timidity and the *via media*. The age is crying out for theological frankness; it asks for lights, not half-lights; truths, not economies of truths. The new theological principle seeks not to overthrow but to conserve, by re-interpreting, the teachings of the Christian religion, notably the "Incarnation" and the "Atonement."

### That Free Thought is Absurd

The idea of free thought in religion is absurd, says the principal of an English theological college. A church without a definite confession is a dead church. Theology is absolutely necessary to prevent the intellectuals from treating religion as a scientist treats a fossil. If Protestantism is to live on, it can only do so by a maintenance of those dogmatic principles which are so strong an element in Romanist spheres.

### That Islām is a Sect of Christianity

The Bishop of Lahore thinks the Christian

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

## MEMBERSHIP

missionaries are now entering a new era, inasmuch as they no longer treat Moslems as "heathen." A Christian evangelist will find himself powerless in dealing with Moslem scholars unless he recognizes Islām as a sect of Christianity.

### That there are Buddhist Missions to England

Buddhism, which has a missionary propaganda in the United States, has now one in England. A meeting of English Buddhists was held in the West-end of London recently to meet a number of their co-religionists from Burmah.

### That the Protestant Church Must Join Rome

There is a movement on foot to promote corporate union of the Protestant Episcopal Church in the United States with the Roman See! Less extreme people, however, propose a union that does not involve admitting the primacy of the Roman See.

### That the Bible is not Fit for Schools

The Saxony school authorities, in conjunction with the country's Evangelical Council, have decreed that instead of the Bible, a biblical reading book shall henceforth be used in all national schools. The book has been specially compiled by order of the Administration, and comprises the New Testament intact; but from the Old Testament, only the Psalms and a few important passages. The entire Bible is permitted, however, to those who have passed the rite of confirmation.

One can find no fault with the prudence which saves children from the necessity of reading books which in their *dead-letter meaning*, present somewhat bloodthirsty and bigoted ideas of Deity,—not always very elevating. And probably the authorities themselves are unequal to extracting from these records the inner significance, Kabalistic and otherwise, which renders them so much more valuable to those who have the keys. The New Testament contains a very fair presentment of the typical life of a World-Savior, with the Golden Rule and the other teachings

of similar kind. But this account has suffered much mutilation and adaptation at the hands of its innumerable compilers, and is always associated in the minds of Bible teachers with many ecclesiastical dogmas not to be found within its covers. For this reason there is much need for welding many words to broader, truer, and nobler meanings. E.

## Clipped From the Press Works on Theosophy Distributed Among Men of the Fleet

MAGDALENA BAY (via San Diego, Cal., April 2.)—Mrs. Katherine Tingley, who conducts the Headquarters of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY at Point Loma, has sent the fleet a large number of Theosophical textbooks and newspapers with the apparent purpose of attempting to get the attention of the 15,000 fighting officers and men.

With "Compliments of Katherine Tingley" stamped on the flyleaf, *The Key to Theosophy*, by Mme. H. P. Blavatsky, the disciple of the belief, and *The Mysteries of the Heart Doctrine* published by the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, have been sent to the flagship, where they attracted much attention.

The *Century Path*, the official organ of the Society, has been sent to all ships. It is probable that many officers and men will visit Point Loma to see the Headquarters of Theosophical thought in America.—*St. Louis Times*

Doubt, truly, is not itself a crime. Certainly we do not rush out, clutching up the first thing we find, and straightway believe that! All manner of doubt, inquiry . . . about all manner of objects, dwells in every reasonable mind. It is the mystic working of the mind, on the object it is getting to know and believe. Belief comes out of all this, above ground, like the tree from its hidden roots. But now, if even on common things, we require that a man keep his doubts silent, and not babble of them till they in some measure become affirmations or denials; how much more in regard to the highest things, impossible to speak of in words at all! That a man parade his doubt, and get to imagine that debating and logic (which means at best only the manner of telling us your thought, your belief or disbelief, about a thing) is the triumph and true work of what intellect he has: alas, this is as if you should overturn the tree, and instead of green boughs, leaves and fruits, show us ugly taloned roots turned-up into the air—and no growth, only death and misery going on!—*Carlyle*

No one is free who has not obtained the empire of himself.—*Gems from the East*

## KATHERINE TINGLEY SPEAKS AT ISIS THEATER

ISIS THEATER, when Katherine Tingley speaks, is always a sight to be remembered; every seat occupied, numbers standing wherever permitted, numbers more turned away, all proved the intense interest to see and hear her again. The great audience, which included visitors from many parts of the United States, listened with closest attention, following with keen appreciation and enthusiasm every point made as step by step Mrs. Tingley presented with forceful logic a picture of the needs, the dangers, the hindrances and the possibilities of America.

The subject of the lecture, "The Broader View of American Life," afforded the speaker the opportunity of touching upon not only those qualities that make for the growth and upbuilding of the people, but also the darker side which, if unchecked, must inevitably lead to decay. In the forceful contrasts thus presented, and throughout the lecture, was an appeal made to the higher nature of the men and women of America—an appeal to the soul of the nation.

As a basis of what American life should be, what its possibilities were, Mrs. Tingley paid a special tribute to the Constitution of the United States, presenting it in a light that was entirely new to many of her audience.

The music by the Lomaland theater orchestra, the songs by the Rāja Yoga girls' special choir, the stage decorations, all gave a charm to the meeting and made an atmosphere that in itself was inspiring and uplifting.

It is hoped that the full stenographic report of Mrs. Tingley's lecture may be published in an early issue of the CENTURY PATH.

RECORDER

## Creeds That Shut Out the Sun

THIS title is not meant to indicate that heathenism shuts out the sun and Christianity does not, nor that Romanism does and Protestantism does not, nor yet that your little sect does and mine does not. It is meant to apply to dogmatic religion in general.

We have been so accustomed to speak of Christianity as the world's light-bringer that it is quite a startling idea that *as it is generally understood* it may have acted as a screen and shut out the light instead of shedding it. Yet this is the idea that we must make up our minds to accept, for verily it is now dawning upon the Christian nations.

Looking back through history with an impartial eye, we cannot fail to see that even as recorded and glossed by Christian historians, it shows many pages on which the influence called "Christianity" is seen standing in the path of progress, hiding the light, trying to stop the free working of inquiry and discovery. On other pages we see how the same influence has seized hold of great progressive movements and turned them aside into a re-

ligious bypath. The church has tried to stop movements, and, failing in that, has monopolized them.

Great poets have striven to penetrate the mysteries of being and to sing of the glories of the inner life of the Soul; and their efforts have been frustrated by the everlasting formulas of religion graven on their minds. The dogmas of death and heaven and hell and man's essential wickedness have saddened their songs. Great painters have arisen and found as their only subjects the meager imaginations of dogmatic religion on which they have wasted their splendid powers. Architects have built—cathedrals.

It has been customary to say that the church and its religion have inspired all this. Is it true? May there not be another view?

The whole mechanism of dogmatic religion, with its vicarious salvation, its doctrine of the single earth-life terminated by heaven or hell, its weak figure of the conventional Jesus, stands in the road and shuts out the light. It even hampers the minds of the most advanced scientists who do not believe in these dogmas, causing them to base their views as to the antiquity of man on Archbishop Usher's annotations to the Old Testament. Dogmatic religion is responsible for much of scientific materialism and scepticism; for it has shut out the real knowledge and given instead teachings that science cannot accept.

Yet—another side to the question. The Churches will ask us, How do you account for the fact that Christianity has exercised such an enormous influence on such a large and important section of humanity for so many centuries?

This is indeed an important fact and one that needs accounting for. It shows beyond question that there has been *something* at the back of Christianity, something that has given it enormous force and lasting power, whether for evil or good. What is that something?

Is it possible that modern Christianity is the result of some great Teaching, some great Religion, that has *gone wrong*?

Consider the early history of the church. Turn, for example, to *The Student's Gibbon*, and we shall find that even in that abstract of Gibbon's immortal work, prepared for the use of schools by a Christian clergyman, Dr. William Smith, and with most of Gibbon's remarks about the church left out,—even in that we shall find that it is impossible to take a favorable view of the Christians of those times or of the creed they professed. So many bad emperors favor them. Their ups and downs are an index to the state of the imperial throne, and it was more and more so as time passed. Their influence indeed seems to have been productive of trouble everywhere. Could these have been the original Christians?

We are slowly learning more about the obscure origins of our Western religion, and

eventually it will become quite clear that there was a time, prior to this Roman period, when the original teachings went wrong, and out of the pure doctrine of the original founder or founders, whoever they were, a dogmatic sect was created. Modern Christians are sadly unfamiliar with church history. Otherwise they would be able to reflect on the doings of all those early church councils at which such scenes were enacted and such intense hatred displayed by sect for sect. At these councils, teaching after teaching was dropped and discarded by one bigoted leader or another, and the final outcome was transmitted with many further modifications to us.

What has become of those original teachings? What were they? One of them was the doctrine of Rebirth or Reincarnation, removed at the Council of Constantinople in 551 A.D., but now revived by Theosophy. Those devout clergymen who want to get back to the ancient church may as well get back a little further and delve a little more thoroughly into the history.

It will be found that Christianity had its source in a great Theosophical movement somewhere near the Christian era; and that this movement was deflected and perverted by powerful influences hostile to progress and freedom, which gained the upper hand. Thus the doctrine of man's essential divinity and power to save himself by appealing thereto was supplanted by the doctrines of intercession and vicarious salvation; the teaching of the Christos, its crucifixion on the Cross of earthly life, and its resurrection therefrom to the higher life was supplanted by the story of an executed Jesus; and the ancient knowledge of the Soul's eternal existence throughout the bodily incarnations was supplanted by the teaching of a single earth-life followed by everlasting heaven or hell.

The teachings of the Sermon on the Mount are pointed to, as if there were not scores of other religious manuals belonging to other religions and containing the same teachings and many more such teachings which our Bible does not contain. These fragments attributed to Jesus of Nazareth are merely culled from a plentiful source and do not entitle their alleged author to any special sanctity or wisdom. As to the miracles, all Saviors are attended by them from the time of their usually mysterious conception to their death.

So it is time we were asking ourselves whether something has not been *palmed off* on us, and that we were making inquiries as to the inheritance on which we have been paid but a scanty interest. All the praise that can be bestowed on our religion for what it is alleged to have done is the kind of praise that might be bestowed on a rushlight in a cave from which the sun was excluded. It may have helped some people and shown them the way for a few steps; but the daylight would have done much more.

### The Society of Jesus in Japan

IT appears that the Japanese Government and the Vatican are not absolutely at one in the matter of the establishment of a Roman Catholic University at Tokyo. It is a year since the Pope authorized it, placing it in the hands of the Jesuit Order.

Now that Order is under a little cloud in Japan, a cloud that arose nearly three hundred years ago.

Somewhere about the beginning of the Sixteenth century Christianity took root to some extent in that country, assiduously irrigated by the Jesuit Order. In due time came the Inquisition with the usual program. From that point of view all was going very well when the Mikado, strangely inclining toward a different one, decided to send an emissary to Europe to see how Roman Catholicism was working there in its own headquarters. After about two years he returned and the upshot of his report was that the Vatican religion would be out of place in Japan.

To the official eye it appeared still more out of place when a plot came to light for handing over the country to the Portuguese crown.

The Dutch and Portuguese were then at loggerheads, and the former happened to capture a ship carrying certain communications from the missionaries in Japan to the King of Portugal. Among these was one explaining that the time was now favorable for a few warships from Spain and Portugal to come and annex Japan to the then combined Spanish and Portuguese crowns.

The Dutch were "mean" enough to forward the letter to the Mikado, and trouble naturally ensued. The Japanese Government had almost as little grasp of the teachings of Christ as the Inquisition itself, and they showed this by inflicting some of the classic Inquisitorial tortures upon the priests and some of their converts. The Order being thus expelled the Mikado did one of the most curious things which history records. The tale is as follows:

All the Roman churches save one were destroyed. That one, near Nagasaki, was turned into a theater for the performance of one solitary play. The play consisted solely in the representation of Roman Catholic church ritual, in fact a service; and fifteen Japanese were set apart as actors to do this regularly. The idea was "lest we forget"; lest the people should forget the misery they had endured and the danger they had run.

One thing remains to make the picture perfect. When in 1865 a Roman Catholic church was erected in Nagasaki, the famous fifteen—the apostolic succession having been unbroken for more than two hundred years—entered it and went through their regular performance. So the officiating priests of the new church, nearly dumb with astonishment, reported to the Vatican that notwithstanding it had been death for two hundred years in Japan for any to profess the Christian religion, a special miracle of God had enabled a small gleam of the "true Catholic light" to survive!

And in honor of this "miracle" the Pope ordered a special commemorative feast day, "The Feast of the Finding of the Christians" on March 17, 1865!

Is there any hoax in history quite comparable with that? H. C.

### International Message to Admiral Thomas

Lomaland Students Send Greeting and Invitation by Wireless Telegraph

BY WIRELESS TELEGRAPH

Point Loma, April 13, 1908

To Rear Admiral Charles M. Thomas, acting Commander-in-Chief, United States Atlantic Fleet, en route San Diego.

The old and young Students of THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, including the boys and girls of the Râja Yoga Academy, at International Headquarters, Point Loma, salute you and the officers and sailors of the Atlantic Fleet. The fair hills of Lomaland in their glory of color and nature life also add their welcome. After the excitement of the city's reception we trust that at least some of your great number may find time to enjoy the refreshing atmosphere of our beautiful Lomaland. The Râja Yoga children hold the days open for you in tribute of music and speech. After the arrival of your Fleet at San Diego a representative of our Organization will convey to you our further compliments. KATHERINE TINGLEY

### Clipped From the Press

The Fleet Leaves Magdalena Bay

THOUGH the following will be "late news" when this issue of the CENTURY PATH appears, it may nevertheless interest readers in other countries, as giving an idea of the now historic cruise. L.

FLEET STEAMING IN COLUMN LINE

A WIRELESS message received at the Point Loma station early this morning states that the fleet got under way at 4 o'clock Saturday evening and that the column of vessels steamed at slow speed going out of the entrance to Magdalena Bay.

All ships weighed anchor simultaneously and slowly assumed their allotted positions, the fourth division taking the third division's place in line and the third division taking last place. The Maine and Minnesota changed places. The auxiliary to the fleet is last in line.

Only the destroyers and the Ajax remain at Magdalena. As soon as the column was completed a standard speed of 9 knots was attained which will be maintained until San Diego is reached. Last night the battleships were strung out in a long line proceeding on their course northward.

Discovery of Biblical Manuscripts

PARTICULARS as to the recent discovery of some new authentic manuscripts of the Bible are given in the *Débats* by M. Gaston Migeon, who was fortunate enough last year to discover, in company with Mr. Charles Freer, of Detroit, Michigan, among the odds and ends amassed by the Ghizeh merchants, certain manuscripts unearthed among the ruins of Akhmin, in Upper Egypt. After prolonged examination by Biblical scholars in America, it seems to be admitted, according to M. Migeon, that these manuscripts are of the fourth, fifth, and sixth centuries. The first one contains Deuteronomy and Joshua; the second contains the Psalms and is apparently more complete than the Vatican manuscript. The third contains the four Gospels, and the fourth the Acts and the Epistles. Mr. Freer's manuscripts are somewhat larger than the famous Alexandrine texts in the British Museum, but the importance of this discovery consists in the fact that a collation of the Freer manuscripts with those of the British Museum shows that many words, and even passages, wanting in the latter, are still pre-

served in the new texts. We may therefore, according to M. Migeon, be on the eve of a fresh revision of the Bible.—London Times.

### Challenge is Issued by Medical Students to Followers of Faith Cure

BALTIMORE, Md., March 21.—C. E. Meixell and Robert G. Lang, students at the Baltimore Medical College, have challenged followers of faith cure to a duel to the death with a pure tested culture of *streptococcus pyogenes*. The germ to be used is considered deadly. The challengers propose to be inoculated with it, if two followers of the faith cure cult will do likewise. In their challenge Meixell and Lang say:

"We are perfectly willing in order to demonstrate the fallacy of the doctrines of Christian Scientists, to allow ourselves to be inoculated with a pure tested culture of *streptococcus pyogenes*, provided any two followers of the faith do the same. We are to rely upon medicinal treatment and our Christian science friends upon their mode of treatment for relief.

"It seems to us that a test, fair and square, is the only means to prove or disprove the value and properties of medicinal treatment or the foolishness and fallacy of the faith cure."

This needs no comment.

### Theater Dedicated by a King

THE NEW ROYAL PLAYHOUSE IN STOCKHOLM, SWEDEN, SAID TO BE A MODEL

THE new Royal theater in Stockholm, just dedicated by King Gustaf, is considered one of the handsomest homes for dramatic art in Europe. The auditorium in particular, with its decoration of pale blue, gold, and white, gives an impression of beauty and harmony. The various halls, corridors and reception rooms have been decorated by Sweden's most prominent artists, among them Julius Kronberg, Oscar Bjorck, Baron Cederström and Carl Larson.

The seating capacity provides for 940 seats, exclusive of the royal box, places for the court and the like. The total cost of erection was two million dollars. Strindberg's masterpiece, *Mester Olaf*, was selected for the opening, which was attended by the king, the princes, and the court. (Kansas City Star)

### An X-Ray Hero

A WELL-KNOWN X-ray expert, Mr. Hall Edwards, of Birmingham, England, has had to have his left arm amputated in consequence of the effects of the rays. For five years he suffered agonies from X-ray dermatitis, and at last could only sleep by the aid of opiates. The bone had become diseased. The right hand is also seriously affected and may have to share the same fate.

This man is regarded as a martyr to his enthusiasm for medical services. He organized a complete field equipment in the South African War; and it was after his work in relieving the sufferings of the wounded that he noticed the peculiar cancerous excrescences on his hands. Special gloves have been invented since then rendering the use of the rays safe.

It is grateful to think that besides its vivisectors, science has its heroes.

It is remarkable, however, what a terrible effect these mysterious, ultra-visible rays have on the physical body. Can it be that they destroy that inner body, the *linga sarira*, which is the model upon which the lives build the outer body, and that thus the coherence of the latter is destroyed? STUDENT

## Greek Architecture in Modern Germany

"ARCHITECTURE was once the great book of humanity," says Victor Hugo in that giant work of imagination, *Notre Dame de Paris*. Yet in this age of printing, when the book as a teacher has well-nigh obscured the building, sometimes the most modern of edifices are veritable cryptograms, disclosing to him who has the key to their meaning wonderful vistas of human history. Thus it is with the building in our illustration.

It presents a curious anomaly, this Greek Temple devoted to art under a cold northern sky, reared by descendants of those free dwellers of the forests who despised all cities, deeming a wall but a prison, and who worshiped Deity on mountain tops, beside sacred lakes, and in holy groves, under the starry vault of heaven. Perhaps this edifice is not, as many aver, an artistic triumph; for Greek architecture was the child of a sunny clime, and the public buildings in Greek style that have been erected in Germany seem at times strangely incongruous, discolored and stained as they must become under the unfriendly winter sky; yet, humanly speaking, their presence does mark a triumph, the closing of a circle, as it were, in the progress of the Greek ideal.

It is an ideal that might have borne fruit earlier on German soil, had its growth not been stayed by the decades of so-called "religious" warfare which checked the art-life that was flourishing under the protection of the medieval guilds—formed of those splendid bands of craftsmen who preserved in their unity the fraternal spirit of ancient days. When peace was again established, art had changed its mode of expression. Literature and not architecture with its allied arts and the crafts engaged the creative spirit of Germany.

A number of minor writers cleared ahead the way for the great Lessing. When he came, he gathered together the broken threads of the past, and then began to stir the awakened imagination of Germany with the old Greek ideals of art. Thus we find that German literature, in its flower, is enriched with poems and dramas that revive the life and ideals of ancient Greece. Goethe, the great national genius of the Germans, is said to have been so perfect a specimen of manly beauty in form and feature that he fulfilled the Greek proportions of physical perfection more truly than the Apollo Belvedere. There seems something fitting and withal significant in this, for Goethe was the flower of the life of Germany for centuries. Just as the unknown singer of the *Nibelungenlied* was the alembic through which centuries of the surcharged life of Germania passed, sublimed and re-sublimed by the poetic fire of his imagination to the epic unity of the *Lied*, so Goethe

synthesized in his genius all the life forces of the past, even those drawn from the holy shrines of Greece, when the northern seeresses prophesied at the sacred tripods, keeping alight the fires of the ancient Wisdom-Religion, the heritage of the Aryan race, shared alike by Greeks and Germanians, nourishing and sustaining their loftiness of soul. That the ancient forest-dwellers, as well as the cultured, art-loving Greeks, bore the sacred

fire in their hearts, the Roman emperor Titus attests. It is recorded of him, that when he beheld the gigantic German warriors he exclaimed, "Their bodies are great, but their souls are still greater."

Following close upon the golden era of German literature and the Greek ideal which it awakened, came a period of classicism in modern Germany, and one phase of it was the erection of public edifices in the Greek style

## FRAGMENT

MAN, once desecrated, imprints forever  
His presence on all lifeless things: the winds  
Are henceforth voices, wailing or a shout,  
A querulous mutter or a quick, gay laugh,  
Never a senseless gust now man is born.  
The herded pines commune and have deep thoughts,  
A secret they assemble to discuss  
When the sun drops behind their trunks which glare  
Like grates of hell; the peerless cup afloat  
Of the lake lily is an urn, some nymph  
Swims bearing high above her head: no bird  
Whistles unseen, but through the gaps above  
That let light in upon the gloomy woods,  
A shape peeps up from the breezy forest-top,  
Arch with small puckered mouth and mocking eye.  
The morn has enterprise, deep quiet droops  
With evening, triumph takes the sunset hour,  
Voluptuous transport ripens with the corn  
Beneath the warm moon like a happy face;  
And this to fill us with regard for man.  
With apprehension of his passing worth,  
Desire to work his proper nature out,  
And ascertain his rank and final place,  
For these things tend still upward; progress is  
The law of life; man is not Man as yet.—Selected

of architecture (as shown in the illustration), veritable scripts in stone witnessing the esteem and gratitude felt by the Germans for the vivifying influences which Greek ideals infused into German culture. STUDENT

SULLY PRUDHOMME was born in 1839, and maybe by his earlier works he will be best remembered. *La Grande Ourse, Douarnenez en Bretagne, La Mer, La Trace Humaine, A un Désespéré*, and a host of other poems have won for him immortal fame. For the last twenty years the poet's mind was steeped in philosophy, but in spite of such arid studies he remained to the last an idealist, a dreamer, an exquisite writer; in short, a great artist.

With many other lovable qualities, Sully Prudhomme was a royal giver. A poor man comparatively, he spent his modest fortune in lessening misery. The poor and the wretched who appealed to him were never sent empty away, for his one object in life was to comfort his fellow men.

Sully Prudhomme was never married, but was cared for in his later years by a sister who adored him, and by her sons. The last twenty years of his life were passed at Châtenay. (*The Planet*, Eng.)

Yoga is skill in the performance of action.—*Bhagavad Gītā*

#### The Test and the Ideal

NOW is a century of Great Promises, a time of ideals. The very air is laden, expectant, waiting, brooding, still with the stillness that precedes birth. Only those who are out of the Soul's eternal tide can fail to feel it. The faint light of dawn steals in at the window. Soon the twitter of birds is all about. The breeze has a fragrant quietness unknown to any other hour. Let one listen then and the soul speaks in trumpet tones, the problems of yesterday are seen in a new light, transfused, transfigured. They have become something else and are problems no longer. The heights towards which we were climbing yesterday and the day before and the day before that, and which we often only trusted were there for we could not always see them, rise clear and glorious before our eyes. We see; we know. It is all so plain now. Then come the day's duties with persistent appeal and as we turn towards them we turn away (or so it seems) from the Great Vision, the Realization that seemed so simple, so near. That is when the test begins, the test which seems ever-present excepting at those rare hours when something like inner repose and true "skill in the performance of action" is possible.

Yet it should not burden us as a "test" or "trial," this problem of how to come down from the ideal glimpses gained at the soul's rare times to the task of practically working them out on lines of our everyday bustling, busy, crowding life. Many, the majority in fact, begin each day's task with no glimpse of the diviner side at all. But of the few who do know how to find the central place of life or who have, as H. P. Blavatsky pointed out, the natural gift of looking at things with the "higher mind," how many of these can come down from the heights and not lose their way? To answer this and then to tell the reason is to explain why so many philanthropists fail

or give up in despair, why so many good-hearted and kindly intentioned people make egregious failures on lines of practical work.

Florence Nightingale stands forth as a rare exception, a soul touched with Theosophy's insight, compassion and faithfulness and ability. To her vision of the ideal she added faith, faith absolute that the vision could be realized, for it is this that makes the will iron, unconquerable, as it made hers.

It is not enough to touch and enthuse men's

**H**E who would profit by the wisdom of the universal mind has to reach it through the whole of humanity without distinction of race, complexion, religion or social status. It is *altruism* not *egoism* even in its most legal or noble conception that can lead the unit to merge its little Self in the Universal Self.

—HELENA PETROVNA BLAVATSKY in *Studies in Occultism*

hearts. That is but half. The other half consists in teaching them how to transmute their love and insight into the faith, undaunted courage and *skill* that alone can make them masters of life's tasks and problems. STUDENT

#### Florence Nightingale, O. M.

**I**T is not common to find in this topsy-turvy world professional ability united with a positively unselfish love for humanity. Unquestionably compassion is not dead in the great collective heart, so to speak, of woman-kind, and just as unquestionably are women becoming professionally skilled in almost every technical direction. In fact, there are those who see in the latter situation a possible menace to the home and "childward care" interests upon which any nation must stand or fall. But in far too many cases the good, the compassionate and the unselfish are either lamentably ignorant of the deeper aspects of the woes they seek to alleviate or else so technically unskilled that they become little better than nuis-

ances. The "Royal Union" of the two, or rather three, heart, head, and hand — which is the Rāja Yoga ideal and will be realized in the girls and women who pass into the world from the portals of the Schools, Academies, and Universities of Katherine Tingley's founding — is so rare that women who do possess it stand out as beacon lights, marked as something worthier than, or different from, the rest.

In 1854, when war broke out between England and Russia, the news of the early victories was followed by letters describing the awful conditions prevailing in the war hospitals — as far as words could describe them. What those sick and wounded soldiers suffered in the hospital camps at Scutari, places choked with uncleanness and impregnated with disease, with almost no nursing and none at all that could be rightly dignified by the term, can never be told. Four out of every five cases of amputation were dying of hospital gangrene, and the death rate had mounted to 52% when finally, after the victory of Alma, Sir William Howard Russell sent the following message to England:

Are there no devoted women amongst us able and willing to go forth to minister to the sick and suffering soldiers of the East in the hospital at Scutari? Are none of the daughters of England at this extreme hour of need ready for such a work of mercy?

Within a week Florence Nightingale, a young woman, heiress to a vast estate, was on her way to the East with a band of trained helpers. She reached Scutari just before the fearful slaughter of Inkerman. She found 2300 patients in the so-called "hospital," most of them victims of cholera, fever, and other preventable diseases, and as night came down on that terrible day when the battle of Inkerman was fought, Florence Nightingale with her little band of thirty-eight nurses faced the ordeal of caring for over five thousand. She had only just arrived and the task

of abolishing filth and disorder had to be begun at the same time. But she knew her business. Nursing was to Florence Nightingale a profession, albeit a sacred one, and to the knowledge of what to do she added an executive faculty that astonished old military leaders. They had done their best and utmost before she came, but they hadn't "known how!" Within a week the Inferno had been transformed into Paradise. The entire hospital camp had been reorganized on sanitary lines, dirt and indifference had disappeared and taken despair with them, and outside of that, the very fact that a woman's hand prepared the food, administered the medicines, wielded compresses, bandages, and even, when need was, the knife, acted as a general tonic throughout the whole institution. When has ever woman been more idolized than was this English lady by the soldiers of the Crimea? for to her tenderness and compassion, her iron courage and self-forgetfulness, she added knowledge, professional competence, skill, for which men, at least, the world over, have unqualified respect. Hospital conditions before she came had been described by Russell himself as "worthy only of the savages of Dahomey."

Yet the work in the Crimea was but an episode in the life of this heroic woman, though, so superb and shining was it, her other work has been thereby somewhat obscured. Few outside of England know, for instance, that Florence Nightingale's writings on nursing are scientific text-books, technical classics, and that she was the first, practically, to realize fully the deeper scientific aspects of the profession of nursing. With the gift bestowed upon her by grateful England after her heroic work in the Crimea she founded in her own land a training-school for nurses. Upon her return from the East Queen Victoria presented her with a costly diamond ornament to be worn as a decoration, and sent her an autograph letter of grateful acknowledgment. Later she wrote, "I wish we had Florence Nightingale at the War Office," yet the project, then so timely it would seem, of having organized at the War Office a Nursing Department with a trained nurse at the head was not carried out until 1901, nearly fifty years later. King Edward's recent bestowal upon Florence Nightingale of the Order of Merit seemed, in a sense, the expression of Queen Victoria's own thought, tribute of woman to woman.

From a London daily just received, we clip the following description of the recent ceremony held in London in honor of Florence Nightingale, accounts of which were cabled all over the world. It is simply written but conveys much.

NO MONUMENTAL STRUCTURE—NO GILDED GRAVE—NEED ENCLOSE THE CLAY OF THIS NOBLE CHRISTIAN TO PERPETUATE HER NAME AND HER DEEDS.

THE FAME OF FLORENCE NIGHTINGALE IS IMPERISHABLE!

In those short but striking phrases, under the

historic roof of the Guildhall yesterday, did London's City Fathers give honor to Florence Nightingale. The council chamber rang with applause as the City Chamberlain handed over to the nephew of the illustrious Lady of the Crimea a casket carved in oak and containing the freedom of the City of London.

It was a brilliant and interesting gathering. The Lord Mayor filed into the chamber in state with his impressive bodyguard around him. To the right of the chair sat the aldermen with the bright scarlet of their robes making high color. To the left were many ladies wearing furs and diamonds. The rest of the floor was sacred to the Common Councillors in their robes of sober blue. Of distinguished visitors there were many.

The near relatives of Miss Nightingale were conducted to seats of honor. . . . Also was represented the council of the Nightingale Fund, a number of old pupils of the Nightingale School, representatives of St. Thomas's Hospital, and many another

*the laches of our predecessors; and lapse of time does not detract in the smallest degree from the sincerity with which we wish to pay our tribute to the life work of this incomparable lady."*

Pathetic is it that this tribute, so gracious, so fraught with the very essence and tenderness of antiquity, so symbolic and significant, should have been delayed until the recipient, bowed by age and infirmity, could not hope to be present. Yet that the best of her *was* present none may gainsay, for the spirit of the work with which she was identified—the Spirit Eternal of Compassion—brooded over that old historic Guildhall on March 16 last as it lives and broods over and illumines every responsive heart the world around. Of it Florence Nightingale was the handmaid and the expression—*because she forgot herself*. Unto it she proved worthy as an instrument *because she perfected mind, understanding, and technical skill*. Because of this more of Compassion's Self has found a home on earth—a mighty thought that leaps the bounds of space and the confines of spheres. What heart cannot be stirred at contemplation of it?

#### Our Comrades in Japan

ONE cannot imagine a picture of any phase—even the simplest—of Japanese life without the nature touch. In the accompanying illustration the glint of sunlight on vine and shrub, kimono and shining tresses is only the expected thing, and not less the presence of "Kimi" the cat, and "Shiro" the rabbit, as snowy white as his name would indicate. Nor is it possible to feel that joy in service to humankind is confined only to human hearts. Never yet was a bit of royal-souled Japan translated for western minds by lens, pencil or brush that something of Nature's own ineffable joy was not fused into the always too feeble translating.

What should we expect of the

land of that Empress Komio who once, when she went to gather flowers to lay upon some Temple's shrine, so felt the appeal of their living beauty that she could not bring herself to pluck them? And these her words:

If I gather ye, O flowers so wonderful in purity, the touch of my hand will defile. So, standing in the meadows untouched, I offer ye, wind-swept blossoms, to the Holy Teachers of the past, the present, and the future!

And Japanese names! Now the ancients taught that there was much in names, deep significance and symbology. Their knowledge we in the West have lost—yes, even the memory of it. In the East they have kept a thread of the old knowledge, and we owe to that fact another of the rare beauties of Japanese life. *Mitsu*, "Light"; *Tetsu-O*, "Iron Warrior"; is not some thought inspired by these? *Itsukushima*, the "Isle Eternal." And so one might go on, until a book were written. Here there is but space to send over the calm Pacific cordial greeting to our new members and a Royal Salute to honored Japan. H.

now carrying on the work of "The Angel Band."

The one notable absentee was Miss Nightingale herself. It was said that her age and her health kept her away. Yet it was a striking picture, and memorable. The note of it throughout was deep admiration and love and honor.

The tribute to this illustrious lady rang sincere and earnest from the hearts of everybody. It was spoken by the City Chamberlain, who, with his hand on the simple oaken casket—fitting tribute to British pluck and British endurance the world over—spoke with real eloquence the honest admiration of the City Fathers of a woman's real womanhood to England.

"We proclaim," he said, "for all time our admiration of the labors and the lofty aims of one of the noblest characters in our country's history, and whom posterity, alike with ourselves, will ever be proud to claim as one of Britain's daughters."

"We regret that owing to some unexplained omission on the part of a previous generation, the honorary freedom—the highest honor in the gift of the corporation—was not conferred upon her half a century ago when she was in health and strength and thoroughly able to appreciate and enjoy it. We today endeavor to repair as far as possible

# OUR YOUNG FOLK

## A Visit to the Shell Lady

THE Shell Lady was at home. She came out to welcome me and took me to the sunny corner of her bungalow where she was working over her beloved shells. Shells everywhere! Even the tiny bungalow is shell-like, for it is fastened like a barnacle to the hillside, and one would think that the boisterous wind would blow it away. But no, the little home is fastened as securely to the hillside as a barnacle to a ship's keel, notwithstanding wind and wave.

"This is the Helix family," she told me, as she quickly took up her interrupted work, and fastened a delicate, almost transparent amber-colored shell into a sea-green box. "They are found all over the earth. Yes," she replied in answer to my questioning look, "these are land shells, not sea shells. Maybe you will know them better if I tell you that they are commonly called snail-shells. I like to give them their Greek name, however, for the old Greeks loved their beauty. If you look up at the capital of a Corinthian column, you will still see a little shell-like curl peeping out of the acanthus leaves. That is called the helix, from the snail-shell."

There was a gleam in the Shell Lady's eyes and a funny little smile hovered about her lips, and with a glance at me over the top of her spectacles she asked,

"Do you know the little poem by Charles Lamb called *The Housekeeper*? As I sat here this morning I thought of it." And with her fingers all the while deftly busying themselves among the shells she told it to me.

The frugal snail, with forecast of repose,  
Carries his house with him where'er he goes;  
Peeps out,—and if there comes a shower of rain,  
Retreats to his small domicile again.  
Touch but a tip of him, a horn,—'tis well,—  
He curls up in his sanctuary shell.

Whereso'er he roam,  
Knock when you will—he's sure to be at home.

How we laughed over the quaint little poem of warm-hearted, gentle Charles Lamb. Then the Shell Lady, without stirring from her place, opened box after box of shells, all of the Helix family. They were of all sizes. There were some almost two inches across. They were so beautifully formed and made of such lovely translucent shell that you thought that even the marble palaces of the Greeks with their stately white columns were not more beautiful than the small home of the humble snail! Some of the snail shells were tinier than a grain of mustard seed, yet when you put them under a magnifying glass, you saw that each one was as perfect as the largest shell.

"There are over thirty-four hundred members to the Helix family," the Shell Lady told me, as I examined a very beautiful one, "and they live all over the world, and have done so

LORD CHARLES BERESFORD AND YOUNG PRINCE DAVID OF WALES

## SAILOR'S SONG

Thomas Beddoes

TO sea, to sea! The calm is o'er;  
The wanton water leaps in sport,  
And rattles down the pebbly shore,  
The dolphin wheels, the sea-cows snort,  
And unseen mermaids' pearly song  
Comes bubbling up the weeds among.  
Fling broad the sails, dip deep the oar:  
To sea, to sea! The calm is o'er.

To sea, to sea! Our wide winged bark  
Shall billowy cleave its sunny way,  
And with its shadow, fleet and dark,  
Break the caved Triton's azure day,  
Like mighty eagle soaring light  
O'er antelopes on Alpine height.  
The anchor heaves, the ship swings free,  
The sails swell full. To sea, to sea!

—Selected

for millions of years. Snail shells have been found imbedded in rock, and turned to stone themselves. Some of these fossil shells are nearly twenty inches across. Now, here is a helix from far-away Hungary, here are some tiny ones from the Pyrenees Mountains in Spain, and here is one from Cuba."

"What a fine way to study geography!" I thought. "A beautiful shell from every remote corner of the Earth, to remember it by. Not only from far-away Robinson Crusoe's Islands, but from mountain tops as well! How

the Rāja Yoga children, who love all the beautiful works of nature, would like to study it that way!"

So I told the Shell Lady my thought.

"Bless their hearts! So they shall. I have a great secret," she exclaimed mysteriously, and the dear little gleam came back to her eyes. "Now, shall I show you more of my treasures?"

"O wait, please," I begged, "until another day!"

"Very well," said the Shell Lady, and the smile again hovered about her lips, as she looked around her shell-like house.

"Knock when you will, I'm sure to be at home!"

STUDENT

## Admiral Beresford and the Young Prince David of Wales

IN the cut on this page you see the young son of the Prince of Wales, standing at the side of England's greatest living sailor, who is Commander-in-Chief of the Channel squadron. American boys and girls—in fact boys and girls the world over, will be interested in the statement that this English admiral bears a strong resemblance to the great American commander and sailor Rear-Admiral Robley D. Evans, who is so prominently before all eyes at the present time as the Commander-in-Chief of the fleet of American battleships in the cruise around the world.

Lord Charles Beresford is famous for his skill in naval tactics. Like Rear-Admiral Evans he has served long and faithfully from cadetship to the high command he now holds. Open-hearted, fearless, absolutely devoted to duty is the genial Irish sailor who stands here with the royal lad whose opening career will be watched by so many loyal loving hearts.

STUDENT

## Bees in Block of Stone

WHILE workmen were sawing through a block of Bath stone at Exeter they cut into a cavity in which was found a cluster of two or three dozen live bees. There was not much sign of life in the bees at first, but when the air was admitted they gradually revived and after a few hours several of them were able to fly.—Exeter (England) Express.

TIME is everything. Fifteen minutes make the difference between a victory and a defeat. Recollect that a brave man dies but once; a coward, all his life long.—Nelson

WHEN the United States fleet reached Angeles Point near Valparaiso, Chile, they saw on one of the hillsides on the shore a sign in pure white letters—"WELCOME." The sailors thought at first it was made of white-washed stones, but soon someone with a glass called out that it was made of men! This was the case; the letters were made of naval cadets in white uniforms. They lay perfectly still for an hour offering a welcome that was mute but not less expressive on that account.

the smile again hovered about her face as she looked around her shell-hole.  
"Knock when you will, I'm sure," she said at home!"

# THE CHILDREN'S HOUR

## NATURE'S EASTER-MUSIC

Lucy Larcom

THE flowers from the earth have arisen,  
They are singing their Easter-song;  
Up the valleys and over the hillsides  
They come, an unnumbered throng.

O, listen! The wild-flowers are singing  
Their beautiful songs without words!  
They are pouring the soul of their music  
Through the voices of happy birds.

Every flower to a bird has confided  
The joy of its blossoming birth—  
The wonder of its resurrection  
From its grave in the frozen earth.

For you chirp the wren and the sparrow,  
Little Eyebright, Anemone pale!  
Gay Columbine, orioles are chanting  
Your trumpet-note, loud on the gale.

The buttercup's thanks for the sunshine  
The goldfinch's twitter reveals;  
And the violet trills, through the bluebird,  
Of the heaven that within her she feels.

The song-sparrow's exquisite warble  
Is born in the heart of the rose—  
Of the wild-rose, shut in its calyx,  
Afraid of belated snows.

And the melody of the wood-thrush  
Floats up from the nameless and shy  
White blossoms that stay in the cloister  
Of pine-forests, dim and high.

The dust of the roadside is vocal;  
There is music from every clod;  
Bird and breeze are the wild-flowers' angels,  
Their messages bearing to God.

"We arise and we praise Him together!"  
With a flutter of petals and wings,  
The anthem of spirits immortal  
Rings back from created things.

And nothing is left wholly speechless;  
For the dumbest life that we know  
May utter itself through another,  
And double its gladness so!

The trees have the winds to sing for them;  
The rock and the hill have the streams;  
And the mountain the thunderous torrents  
That waken old Earth from her dreams.

She awakes to the Easter-music;  
Her bosom with praise overflows;  
The forest breaks forth into singing,  
For the desert has bloomed as the rose.

—Selected

### The Little Gray Hen

ONCE upon a time there was a little gray hen. She lived in a very pleasant poultry-yard and was a very happy little hen until one day in spring, when fresh green was peeping out everywhere, and fluffy little chicks were coming out of their shell prisons, and children's voices were ringing merrily through the balmy air, something new, something strange and disturbing entered into this little gray hen.

It began with the singing of a bird, who, from a tree near the poultry-yard, poured out such a sweet song that the little gray hen stopped scratching in the earth to listen. As the bird flew away she said to herself, "Why cannot I be a songbird? I see no reason why. It is very tiresome to be nothing but a hen and scratch in the earth and lay eggs. Why should I not fly up into a tree and sing too, so that people will come to the windows and doors to listen and say 'What a sweet song!' Of course it is very pleasant to be down here on the warm earth, but I intend to be something more than just a common gray hen and I will begin now."

And with that she flapped her wings frantically and managed to fly into the tree where the song-bird had been. Then she began to cackle, for of course she could not sing. Such a noise as she made! If she had not been so determined to be something more than a hen, she would have been frightened at the sound herself. The maid who fed the hens heard her, in the house, and came running out to see what was the matter. As she came to the tree the hen made a louder noise than before. Now at last people were beginning to see that she was something out of the common! The maid tried to reach up into the tree and take her down but she could not. So she ran into the house to call her mistress who came to see for herself.

"What a noise! How shall we stop it?"

"We must get her down," said the mistress, "just pick up some little stones and throw them up at the tree. That will frighten her and she will fly down upon the ground.

One of the stones struck the hen. "So this is what comes of pretending to be a song-bird," said she. And down from the tree she flapped in disgust. She went back to the poultry-yard and kept still for some time. But she could not rest. She looked up, up into the blue sky and saw a great hawk flying about.

"Why cannot I be a hawk, and fly high, and swoop down, and show the hens how powerful I am? It is very tiresome just to be a hen and do nothing but scratch and lay eggs. I know that I can do as the hawk does. *I will be a hawk.*"

With that she flapped her wings frantically and managed to fly up on to a high fence that was between the poultry-yard where she lived, and another one belonging to the next house. Feeling as if she were indeed a hawk, she suddenly swooped down upon the hens there, cackling so loudly as to terrify them all. She made such a disturbance that the people came running out of the house to see what was the matter. When they saw this gray hen frightening all their chickens, one of the maids caught her and held her tightly. She took her back to the next house and told what a disturbance this gray hen had made.

"Why," said the people who owned the would-be hawk, "it is that crazy little gray hen of ours!" "Shut her up in the poultry-yard," said the mistress, "keep her locked in for several days."

So imprisonment was what the ambitious little gray hen suffered as a result of pretending to be a hawk. When she was free again she enjoyed scratching in the earth and she went farther from the hen-coop and the poultry-yard than she had ever been before. She came to a small park where the fresh grass was creeping up, and where delicate spring flowers grew on the border of a tiny pond.

It was so peaceful and quiet that the little hen felt almost content to be a hen. But what was that? Four beautiful, stately swans sailed by. The gray hen watched them and ambition stirred in her once more: "Why cannot I be a bird like those, so beautiful and graceful? It is very tiresome to be only a

common gray hen and scratch on the ground and lay eggs. Why should I not sail on the pond instead. I am sure that I can. *I will be a swan.*"

With that she plunged into the pond. She struggled and flapped, and struggled and flapped, and would have sunk to the bottom of the pond, for of course she could not swim, had not two children who were playing on the shore run to see what was the matter and brought her up with a stick.

She was so exhausted that they carried her home, and when their mother saw her she said, "Why it is that crazy little gray hen of ours. What will she be doing next?" She then ordered the maid to lock up the hen and on no account to let her out for at least a week.

Whether the plunge into the cold water had cooled the fever that this little gray hen had been in that made her *pretend* to be anything but a gray hen, I do not know. Perhaps while she was shut up for a week she had time to think. But a change *did* come over her. She began to say, "I cannot be a song-bird. I cannot be a hawk. I cannot be a swan. But I *can* try to be a good hen."

This she did; and so hard did she try that not very long afterwards I heard that the little gray hen was the very best hen in the poultry-yard. COUSIN MARIANNE

### A Dog to be Trusted

A DOG who had proved himself able to guard and care for his master's property, once carried all day in his mouth a five dollar gold piece which his master had dropped as he left the house. The man discovered he had lost the gold during the day. When on his return he was informed that his dog was ill and would not eat, he went at once to the dog who, as soon as he saw his master, ran to him and dropped the gold at his feet. Then he was ready for his dinner. Think of going hungry all day to guard his master's property. This is the real vigilance that can suffer, if necessary, to guard a trust. E.

THEY can, because they believe they can. —*Vergil*

NOTHING is easy to the unwilling.—*Proverb*

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogenesis

Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

## Is America in Danger?

THE word America is here used to mean the "New World," both North and South, but especially the United States and Canada. As looked at in a broad way, we may regard all the States in South America as representing a great stream of Latin peoples finding freer life in the New World. They, in some respects, stand related to Southern Europe as Magna Graecia was related to Greece. North America presents a very complex and interesting subject of study. The great sixth sub-race of the future is here in its infancy. It already exists. It is already as H. P. Blavatsky has shown, visibly differentiating from the rest of the world. In its future growth two main elements must be interwoven—the very similar racial strain which we find in Canada, and also the complex, heterogeneous stream of immigrants, good, bad, and indifferent, which annually pours into the United States from Europe, and which, in its bad or indifferent elements causes no little anxiety now, and may cause much trouble in the future. The mixing of elements to constitute the great Sixth Root Race, in the distant future, cannot be a matter of sentiment or of chance. Great laws are operating; and karmic influences are presenting the summing up of a long past. Above all, and through all, the Divine Purpose lives and moves towards ultimate perfection.

## The New Race Forming

The United States and Canada stand out amid the nations of the world as unspeakably important, just as a child is important who, when grown to manhood, will exercise a mighty influence on human destiny. America is important on account of the vast possibilities for good or evil which it contains. It is destined to be the theater where many influences which met in former ages will meet again. All true lovers of America and of Humanity must fervently wish that as the new race grows it will pass safely through the perils of youth, and reach manhood with all its powers for good healthy and strong—and all inherited failings vanquished. But this will not happen unless great care—eternal vigilance—is exercised.

## The Dangers of Exuberant Life

As in the vegetable kingdom we often find that a rich soil and a warm, genial climate cause the young shoots of some plants to be subject to various pests, so it is in the life of an individual, and in the life of a nation. The very freshness, and the exuberance of young life seems to offer a home to evil as well as good. Therefore, from all

teaching by analogy, and from all the lessons of history, we may conclude that the exuberant young life of the new race on this continent will make it a critical spot for Humanity. The natural resources, the rapid accumulation of wealth, with the many possibilities of pleasure thus afforded, are opening gateways through which are entering, and will continue to enter, those vices that have proved so dangerous to other civilizations. And even the love of liberty and the youthful over-confidence in great results being easily attained, without self-mastery, and perseverance, and watchfulness, will constitute an open door through which less commendable things will seek to enter. In other words, the

**Watchfulness of** new nation has to be watch-  
**Excellences** ful of its excellences, of its  
**Imperative** advantages, and of its splendid opportunities, and not

alone of its faults and vices. If the people of this new race could but pause in the struggle for material things, and behold with clear vision the dangers which are imminent, then the future would be more secure. We should be wise students of history. "Heirs of all the ages," we should be wise by laying to heart the lessons of the past.

It should be self-evident that the evils which have beset other nations and peoples will beset the new race on this continent. The "Great War" between the forces of good and retrogression will be fought over again here—the battle has begun. We feel sure that the victory will be on the side of Light, Liberty, and Righteousness; but the victory will be more complete if the nation arouses itself in time to meet its real dangers.

If old countries exercise a constant influence on new nations, it is also true that new peoples powerfully influence older lands. The influence of America has been very great upon the older nations of the world; and it is safe

**What Shall be**  
**America's**  
**Religion?**

to say that it will be vastly greater in the future. How will this influence operate in the religious domain? It is generally conceded that the religious element is, and always has been, a very important factor in the life of humanity. America has been the means of helping the world to more advanced views of political liberty; will it perform a similar function in regard to spiritual freedom? How does the case stand? At present we see the great effort that is made to engraft on the young life of this country an antiquated form of religion, which not a few of even the older nations have, in a large measure, rejected. One of two things will happen. Effete ecclesiasti-

cism if it dominates this country will crush the spirit of liberty and progress in the new race; or, on the other hand, the life of the new race will so react on this medieval form of religion that it will become radically modified. That is what America has to face.

It is growing plainer every day that the New Age, upon which we have entered, is a time of sifting, of separating, of judgment—a time for no half-measures, but for radical changes in all departments of human life. The breath of a new Spring is in the air, and it is all-pervading, irresistible. This is recognized by thinkers. In the last number of the *Hibbert Journal*, the Rev. G. Tyrrell, who should know something of the Papacy, and of Modernism, writes that a crucial point has been reached.

History, however, teaches us that pressure from the environment has again and again forced that system (the Papacy) to yield in various ways, for the time being. One might instance the triumph of Aristotle or of Galileo. But for the triumph of Modernism it would have to yield altogether and become extinct. Is this conceivable?

So certain is the Encyclical that the results of the historico-critical method are fatal to the juristico-scholastic Church-theory, that its logic is directed principally to an attack upon that method; and lest logic should prove too frail a weapon, it decrees that the seminary walls shall be raised higher; the windows buffed; the doors barred, and the chinks stopped up. Modernism, as it rightly perceives, is due to infiltrations of current knowledge and enlightenment.

It is this spirit of medi-  
evalism which seeks to exclude the light of growing thought. It attacks a vital point.

In the same number of the *Hibbert Journal* is another very suggestive article on "The Papacy and American Ideals." The writer is firmly convinced that the Papacy is utterly opposed to the genius of America, and he believes that it will be fatal to the spirit of liberty and progress here unless some great modification takes place in the relation of Romanists to the Rule of the Pope. He believes this is possible. He says:

A true historical appreciation of the Papacy is rare . . . one often speaks of the Papacy and the Church of Rome as synonymous. But historically they are not identical: the Church is perfectly conceivable without the Papacy: the latter is grafted on the Church, and owes its origin to causes which are distinct and separate. There was once a Church without a pope, and to trace the steps by which the

Bishop of Rome achieved the Primacy, and finally attained infallibility (in 1870) is one of the interesting problems of history.

The writer briefly shows how the bishops of Rome, from various causes, generally political, came at last to inherit the position of Pagan Rome—the Papacy became the ghost of imperial Rome. One of the steps by which the Popes stepped into the shoes of Imperial Rome may be noted, because in the late war between the United States and Spain over Cuba, the old policy was tried: the Pope made an effort to be recognized as arbitrator! It is this position of arbitrator that Mr. Henry C. Lea has shown to have been of such importance in gaining influence for Papal rule. The

writer in the *Hibbert Journal*, Rev. L. Henry Schwab, concludes that the

candid student of history will recognize in that institution (the Papacy) a growth according to laws that have been operative since the world began, a growth which has no sanction in religion, no connexion with Christianity other than that the religion of Jesus has been made the means of the pursuit of ambition, an ambition which sought various means of gratification, but whose opportunity was chiefly found in one of the most deeply graven sentiments that mankind has known, the sentiment of Empire, of the Roman Empire. And Pius X is today more truly the successor of Augustus than of Peter.

The writer is at one with the Rev. G. Tyrrell in perceiving that the return to the Scholasticism of Thomas Aquinas advocated by the present papal régime is entirely opposed to the spirit of modern progress, and must be fatal to the American nation if unchecked. He says:

The fact, therefore, which we have to face, and the danger to American institutions is this, that an Italian ecclesiastic possesses to a large degree the power to maintain the intelligence and spirituality of millions of Americans on a level with his own.

Mr. Schwab thinks there is only one solution of the problem: the Romanists in America must separate from the Papacy. In fact we have come to the vital question which Henry VIII had to grapple with; and which, more recently, France has had to grapple with: who is to rule this country? For:

the proud traditions of Anglo-Saxon liberty are being sapped of their power and influence by an Italian bishop 3000 miles away.

And, further, he says:

There are surely in America patriotic and religious Roman Catholics to whom it is a matter of grave and immediate concern that the worship of their Church should degenerate into the now popular cult of the Sacred Heart: to whom it must cause pain that the pure faith of Christ should be supplanted by a superstitious use of relics, and an adoration of saints.

Two things have marked the growth of the churchly influence, the striving for temporal sway, the attempt in every age and country to establish a kingdom within a kingdom; and what is even more serious, the attempt to dethrone the divine in man, and to establish the voice of the ecclesiast instead of the voice of God in the Soul.

If the spirit of the new race in America, and elsewhere, comes out victorious in the contest, as no doubt it will, what will the result be? The Rev. G. Tyrrell thinks that the influence of mediævalism will not be bent simply, but will be broken by the progress of the spirit of Modernism. The shadows of night must vanish utterly before the approach of the dawn. The Rev. Mr. Schwab thinks a great modification must take place, and that it is possible, in America at least, for the Romanist Church to separate itself from the Papacy. He holds that the existence of American ideals demands this.

But that there is danger ahead none can

question. That the struggle will be severe, and perhaps long, one may predicate from a knowledge of the past. That the ship of American liberty, spiritual as well as political, will emerge from the fury of the storm, still sound, but bearing upon it many a mark of the fray, we do not doubt. It is necessary, however, to work as well as wish; and to be vigilant as well as hopeful. To be warned is to be half-armed. To be united is to be strong. There is danger. There is danger to the cause of education. Look at England and take note. And there are many other sources of danger which anyone watching the course of events cannot fail to notice. All these can be met and overcome, but only by the nation being awake, alert, and ready in the cause of spiritual liberty. (Rev.) S. J. NEILL

### The "Analects" of Confucius

AN article on this subject appears in *Great Thoughts*, which gives some quotations from this collection of the Master's wise sayings and deeds.

The teachings of Confucius seem appropriate to a kind of Saturnian era, and exalt prudence, patience, solidity of character, learning, and respect for what is old and venerable. Some of the quotations are as follows:

To learn and then to practise what one has learnt—surely this brings with it a sense of satisfaction.

When you have erred do not fear to correct yourself.

If I do not myself take part in my offerings, it is all the same as if I did not offer them.

Virtue dwells not alone; she must have neighbors.

If the "superior man" makes nothing of social good feeling, how shall he fully bear that name?

Not even while he eats his meal will the man of virtue forget what he owes to his fellow men.

The principles of our Master's teaching are these—wholeheartedness and kindly forbearance; these and nothing more.

Confucius' favorite disciple H'win "listened the whole day long, controverting nothing, as if he were without wits." But his conduct was "satisfactory in all its issues—he was not without wits." A lesson this, for those inclined to argue before putting the teachings of their teacher to a practical test. The ideal of H'win was to live without boasting of his abilities or parading meritorious deeds.

Another disciple said, "That which I do not wish others to put upon me I also wish not to put upon others." Nay, said his teacher, you have not attained so far.

Said the Master:

I am a transmitter and not an originator, one who believes in and loves the ancients. What do you find in me? A quiet brooder and memorizer, a student never satiated with learning, an unwearied monitor of others. I have never withheld instruction from any, even from those who have come for it with their packets of dried meat.

In this one is reminded of both Jesus and Socrates. The *Analects* say that

In his own village Confucius appeared somewhat plain and simple, and looked unlike a man who possessed ability of speech. But in the ancestral temple and at Court he spoke with the fluency and accuracy of a debater, but ever guardedly. At Court, conversing with the lower order of officials, he spoke somewhat firmly and directly; with those of the higher order his tone was more affable. (In his behavior toward the Prince) he was constrainedly reverent in his movements, and showed a proper degree of grave dignity in his demeanor. T.

# Some Views on XXth Century Problems

## Professional Wriggling

THE learned and professional hypnotist, like the learned and professional vivisectionist, occasionally comes out of his laboratory and condescends to talk with us of the market-place quite simply and soothingly. We have votes, we of the market-place, and unless soothed we might take it into our rude and impulsive heads to make both hypnotism and vivisection illegal.

So we are assured that if anything the animals rather like being vivisected; that it hardly ever amounts to more than a needle-prick; that they are deeply chloroformed even for this and killed before they awake; and so on.

As to hypnotism, the idea that the will of the patient is subjected to that of the operator, or even affected at all, is absurd. The former is merely shown by the latter how to cure himself. No mischievous *rapport* is developed; there is no such thing as mind-reading, and no subtle emanation passes from one to the other. The whole process is purely beneficent and normal.

But now and then, in an unguarded moment, the cat leaps from the bag. We hardly notice it; the neck of the bag is quickly tied up again and we forget at once that it now contains no cat.

A noted Eastern professor, who has just written a second book, said in the first, page 3:

Hypnotism, or hypnotic sleep, implies a mind condition in which the mental action and the will-power of a sensitive subject are under the control of an operator who has induced the state.

Two pages farther on:

It has long been known that a human being can be thrown into an artificial sleep, during which he sustains such a relation to an operator who has induced it that he is sensitive only to what the operator tells him he is sensitive to, and is wholly subject, so far as his mental operations and physical actions are concerned, to the volition of the hypnotist. . . . For the time being his individuality is surrendered to the person who has hypnotized him.

Five pages later, having described the usual hypnotizing method:

And in a few moments a profound breath is taken, the lids close . . . and I know that I have been given possession of that soul for such time as I may prescribe, to do with it what I will.

"Have been given" — the phrase has quite a pious effect about it.

But much later in the book the professor seems to think that he may have been sawing away at the near continuity of the branch upon which he wants to be allowed to sit. So, page 268:

Will-power has nothing to do with hypnotic suggestion, neither the will-power of the operator nor that of the subject. Paralysis of the will, which is the *bête noir* of the popular mind, is inconceivable. The mesmerizee is inspired or empowered, as the case may be, and works out his own salvation in his own objective life without conscious effort of any kind. . . . Above all, he is in no degree subject to another will.

A reviewer of the more recent book, which

recounts a large number of hypnotic cures of various maladies and bad habits, asks:

To an unbiased reader of this book the question comes again and again, how can these things be possible and the mass of reputable physicians and other intelligent people remain absolutely indifferent to their significance?

So far as the majority of physicians are concerned, the answer is — materialism.

Their trained thinking consciousness is materialistic. To accept hypnotism at all would be, for most of them, to accept it with what their deeper consciousness knows and tells them — that something materially inexplicable is involved. Rather than admit that — and who knows what, once that were admitted, would force its way along with it? — they find it simpler to close their minds against the whole thing. A few, however, have accomplished the feat of rejecting all the phenomena save those which — they think — can be explained materially.

As for the great majority of the public, no wriggings of science will ever quench their intuition that there is a subjugation of one will by another, is a drenching of one consciousness by the emanations of another; that hypnotism is, in fact — "Black Magic"!

## Genius and Insanity

A FRENCH thinker, Dr. Joseph Grasset, has examined Lombroso's doctrine of the identity of genius and insanity with a fine clear lens of commonsense.

That genius is often accompanied with a neurosis, especially epilepsy, is not deniable. According to Lombroso, the relation is *necessary*. He almost affirms that "an attack of genius" resulting, say, in a poem, is nothing but an attack of epilepsy, merely occurring in a subjective instead of a muscular form. *Consciousness* is convulsed instead of the muscles.

The reply is obvious. If genius is subjective epilepsy, the possessor should show marks of the disorder beyond the seizure. The real epileptic is slow of speech, slow and hesitant of mind, poor in memory, deficient in concentration. The real man of genius is in one or all of these respects the exact opposite. If in the man of genius, real epilepsy does appear, the other symptoms will be forthcoming and the days of his genius are usually numbered.

If genius is morbid excess of function, a disease, it should, like other diseases, damage one or more other functions. But its possessor is often in perfect physical and mental health.

If genius occasionally changes into "its other form" — epilepsy, or an obvious neurosis — and thus reveals its true nature: why does it never happen that an epileptic or neurotic, primarily that, suddenly ceases his epilepsy or other neurosis and become a man of genius?

Two real truths appear to lie at the base of Lombroso's contention.

First that genius sometimes makes a man a social lion and sometimes, if the truths he sees and tells are unpopular, a social outcast.

The lion and the outcast are equally liable to develop habits very detrimental to health. The one may dissipate; the other brood or dissipate or both.

And secondly, the intense fire of genius, working in a brain and nervous system poor and weakly by heredity, may overstrain its instrument. The instrument would have done very well for an ordinary man, but it cannot stand the extra pulse. The man of genius needs the best instrument that can be gotten, though not necessarily of the type called robust; it must be best in the sense of most balanced, internally harmonized. Bad habits will be much more disastrous to him, physically and mentally, than to the man whose consciousness works at lower voltage.

Sometime we shall have to distinguish between the man of genius and the man at one with his Genius, his soul. The man of genius is in touch with but one of the electric threads connecting personality with the Genius within. The man who has transcended personality and reached the union, made the "atonement," at-one-ment, throughout the succession of his subsequent lives in the world uses any of these threads in accordance with the special needs of humanity or any section of humanity at any particular time. He makes his personality dance to what tune he will. The genius of the man of genius is the result of a little of the light of his soul, of his Genius, penetrating into the more or less passionate and selfish consciousness of mind, taking advantage of favoring moments to do its best. The man of genius could infinitely intensify his gift if he would recognize the source of it and act accordingly, guarding his body and mind, overcoming ambition by compassion, creating that he may give, not get; and so making his life and his motives run along the lines of that inner Presence of light which is his future self. Since to every man there is his Genius, the path to genius is open to all, reachable in this or a future life.

## How to Fortend Insanity

AN English asylum medical officer, letting his attention wander a moment from his patients, has rested it upon their relatives who came to visit them. Of these he found that a very large proportion betrayed more or less evidence of insanity on their own account. Some, save that they were not dangerous, might have well passed over to the inmate list.

When therefore we consider, say the 5000 insane of Chicago, we must multiply this number by at least three.

And we might then usefully remember that of all this crowd, had there been proper training in childhood, probably not ten need have been insane. The person who is at the mercy of his bodily consciousness we call a sensualist; the person at the mercy of his mind is insane. No one risks insanity who has been taught in childhood to hold his mind as but his instrument and himself as its owner and master, a soul, and of the same essence as the World-Soul, an embodied light. ## Trajan's Forum

**T**HIS was the latest and most spacious of all the Fora. A great spur of hill, connecting the Capitoline with the Quirinal, was cut away to make a level site for the buildings. The illustration shows the column of Trajan which was erected at one end of the Forum. It is 98 feet high, and on the shaft are arranged in 23 spiral tiers reliefs illustrating Trajan's victories and containing about 2500 figures. The colossal bronze statue of the emperor, which once surmounted the column, is now replaced by a poor figure of St. Peter, placed there by Pope Sixtus V, so that the whole forms a fitting symbol of Christendom built on a medley of ancient remains. T.

## Using Prehistoric Reservoirs

**S**OME colonists at Dublan, Chihuahua, Mexico, are preparing to utilize several water reservoirs constructed by a prehistoric people. These reservoirs can irrigate forty thousand acres of land. Throughout the valley are ruins of irrigation ditches, which are also being repaired for use; and the reservoirs, built of stone and earth, show excellent workmanship and engineering skill.

In the near-by mountain are cliff dwellings; and, says a report, the anthropologists believe the cliff dwellers were not the same people as the reservoir builders. Probably not! What is more remarkable, in view of current theories of race-evolution, is that the anthropologists believe the cliff dwellers are *later* than the others. If they thus admit that it is not safe to infer the relative ages of races from their relative state of civilization, then the basis for much theorizing with regard to Stone-Ages and such-like is knocked away. Perhaps the Stone-Agers in Britain, for instance, were some such *later* race. STUDENT

## Man in the Glacial Epoch

**"T**HE Influence of the Glacial Epoch upon the early history of Mankind" is the title of a paper in *Records of the Past*.

The writer begins by recalling the fact that in 1859 some eminent English geologists fluttered the doves of orthodoxy by returning from a visit to the Somme Valley in northern France and announcing their confirmation of the discovery by Boucher-de-Perthes of rough stone implements in connexion with the bones of *Elephas primigenius* in the "high-level" glacial gravels. The cause of the fluttering was that at that time the Glacial Epoch was believed to be so remote that the discovery

Lomaland Photo. and Engraving Dept.

TRAJAN'S FORUM, ROME

would give to man an antiquity of more than 100,000 years. The estimate was based upon the calculations of the "uniformitarian" school of geologists who, estimating the time required for the deposition and erosion of strata at the same rate at which they were believed to be deposited and eroded at the present day, had demanded hundreds of millions of years for the age of the sedimentary rocks.

Since 1859, however, geologists have much reduced the antiquity of the glacial epoch and of strata in general. For one thing the physicists and physiographers, like W. Thomson and George Darwin, would not allow them so much time; and for another they had extended their observations of the rate of erosion and given up the theory that it has always been uniform.

Hence our writer, after adducing numerous facts and considerations, finds himself able to make the glacial epoch in America not more than 7,000 to 10,000 years old.

Now here one catches the scientific men at a game known as reasoning in a circle. For often, when denying the antiquity of man, they have argued that no human remains are found in old strata; and now they argue, when human remains are so found, that therefore the strata in question must be recent. One must be pardoned for inferring that even

now scientists are not free from the influence of that theological dogma which has stamped upon the minds of generations the idea that humanity must be a recent product, thus biasing all the conclusions of scientists and preventing them from drawing the inferences which observation and analogy would naturally have suggested. When they shall have succeeded in freeing their minds from this hypnotic impression, they will realize how perfectly groundless it is, and that for denying human antiquity there can be no other reason than fear—fear to admit truths that would disturb convenient religious dogmas or enlarge the field of scientific speculation beyond the limits of a comfortable exclusiveness.

But one must thank the author for something that he does admit—something that the CENTURY PATH has often insisted on. It is a common sense view and Theosophists gladly recognize the instances where common sense is bursting the barriers of dogma, religious or scientific. He says that at the Glacial Epoch humanity presented as great extremes as it does now. That except certain labor-saving inventions, the civilization of Babylonia was as far above that of contemporary Palaeolithic man on the borders of the ice-sheet as ours is above that

of the Eskimos on the Greenland ice-sheet. That the progress of mankind has not been so great as is popularly said. And that 10,000 years ago humanity had all the leading characteristics it has today; there were centers of high civilization and wide areas of barbarism; and the same is true today, only the centers have shifted.

But 10,000 years ago is a short time in the history of the human race, once we shake off the theological dogmas; and one would beg to suggest that the same things may have been true of humanity 20,000 or 100,000 years ago. The writer discusses the shifting of civilization in Europe and America owing to the advance and recession of ice, and thus throws light on some of the later—even if prehistoric in the ordinary view—history of mankind. But there have been many cycles of geologic change and other glacial epochs. And here Theosophy takes issue with science (at its present stage) by declaring that humanity has been on earth for millions of years and that the older strata were not given over entirely to animal and vegetable life. This is the natural view, apart from theological dogma; and that it is in harmony with the facts as well as with the ancient traditions, is being daily proven by science itself, thus confirming Theosophical teachings. STUDENT

# ✻ The Trend of Twentieth Century Science ✻

## Theology in Science

**T**HEOLOGY used to tell us that the earth was the center of the universe and the only field of life. Science finally slew this idea, but faint pulsations of its vitality seem to be still in the air. They even touch no less a mind than that of Dr. Alfred Russel Wallace.

In a book published in 1903 he tried to show two things. First, that the earth is the center of the stellar universe, or very near it. Second, that no other planet in our solar system or, probably, in any other, is habitable.

Any astronomical mind might arrive at the first opinion. Astronomers do not accept it, but they are respectful towards it. It is scientifically arguable.

But the other view is in a different class. The answer is so obvious, so immediately self-suggesting to scientific and unscientific minds, that one is led to give the *idea* rather than the *argument* one's first attention. Only one of the several planets of only one of the hundred or so millions of suns is worthy to be the bearer of life! The universe is worse than a gigantic Sahara, for that did once have a population. One begins to feel profoundly lonely — and also, somehow, a little ashamed of existing. For think of the numberless numberlessnesses of beings that *might* be having the privilege of existence but are not! Who are we that we should be having an honor denied to them?

What should we say of a savage who denied that there could be anything living in the sea because it would get drowned, because the conditions obviously make life impossible there? We should simply say that it was an opinion only possible to a mind of that order.

We have great respect for Dr. Wallace; but still, he has said almost that very thing. And the fact that with *his* order of mind, he *has* said that thing, suggests that he has been touched by an almost spent wave from the past. With Mars for a text he has returned to the charge, now arguing that there cannot be water there, that the "canals" are some natural phenomena, and that therefore there can be no inhabitants.

It has recently been shown that plants deprived of potassium can make a shift with sodium. They are not happy, but they can just do it. With the slightest change in their constitution they could do it very well. Another slight change would enable them to use arsenic instead of phosphorus, manganese instead of iron.

If in the spectrum of a planet in all other respects like our own we were to find no phosphorus, no potassium, and no iron, we might argue that life was there impossible. Yet it might not only be as profuse as the life on our own but very nearly identical. On another planet water might be a permanent solid, constituting the bones of the living beings, and liquid carbonic acid the prevailing fluid. They might breathe helium or hydrogen, or not breathe at all. And their intelligence might be so much *greater* than ours that it would never

occur to *them* to suppose our planet void of life for the mere reason that water is here the fluid and oxygen the vital gas.

There is more than one of the supposedly dead old ideas still alive enough in the air to be doing a good deal of damage even in strong and profound minds. Theosophy will one day have to make a complete list of them and point out the unsuspected way in which they are at work, the unsuspected forms in which they are permitted to clothe themselves. Some of them are very skilful hypnotists.

STUDENT

## An Eternity of Collisions

**A**STRONOMERS occasionally face the question: why, if the universe has existed for an infinite time is it not everywhere of a uniform temperature? It must either have existed infinitely backwards, or have begun somewhen. If it began somewhen, at what point after the beginning came diversity of temperature? And how? The diversity implying a plan, intelligence, a logos, cosmocratores — and those being impermissible, the beginning had to be given up and the infinite backward postulated.

Why, then, in infinite time has not all diversity of temperature among the parts been wiped out? The answer is very ingenious; whether it will stand the test of further investigation remains to be seen.

Collisions between stars occasionally occur. We know that. The theory requires that collisions shall be part of the regular cosmic process, practically an incident sometime in the life of every star. That, to begin with, is a large requirement!

The collision reduces both the collidants to a single nebula. As in the huge majority of cases the collision is sideways of the line connecting the centers of the two bodies, one overlapping at one side and one at the other — the result is a nebula rotating with enormous velocity and with a long streamer at each end of the great diameter. The figure might be symbolized by one of the two limbs of a svastika.

The nebula, in consequence of its size, is in the pathway of "neighboring" stars that are attending to their proper business. They either pass through it, leaving blank swathes and carrying along with them a lot of its matter to be absorbed by them or by their planets or become new planets to them; or it absorbs *them*, they becoming vast new planets — really minor suns — to the great sun constituted by the glowing center of the nebula. Such will form anyhow, from condensation centers arising in the nebula itself. A new solar system will have begun its life.

Given the collisions, all things become possible. A permanently self-rejuvenating universe can be worked out. Life can originate and run its course again and again forever through eternity. But the collisions have themselves to be accounted for. They are formally casual, and life casual and meaningless and therefore worthless; or, they are due

to intelligent overseership. Astronomy, like the other sciences, ends in philosophy. If we will not let it do so we confront an orderly universe with every mark of structure on the grand scale as on the infinitesimal, fashioning and running itself blindly; profusely *productive of intelligence and consciousness, yet possessing neither!*

STUDENT

## "And So Ad Infinitum"

**B**IOLOGISTS are now agreed that there are microbes so small as to pass — as ordinary bacteria will not — through any filter, and to be beyond the limits of microscopic visibility. The ordinary microbe is about 1/30,000 inch in diameter. It is a cell, made of a vast number of molecules, the latter regarded as inanimate. When these invisible microbes shall have been fully demonstrated, and perhaps some beyond this first lot, the gap between them and the inanimate molecule will be still hypothesized.

Is it not in all probability an imaginary gap? There was a time when bacteria were themselves unknown. With an improved microscope they appeared. With still closer investigation another layer of life appears — though the "appearance" is not yet a visible one. We seem warranted in carrying our imaginations yet further, down through the smaller and smaller — yet still living, until at last we reach the individual molecules: life becoming simpler and simpler, more and more uniform, yet remaining life, refusing us the right to draw any line at all, to suppose any gap. Metals in mass, as Professor Bose has shown, exhibit many of the phenomena we have been accustomed to associate with life; they get fatigued; they recover by rest; they may be hurt and poisoned; they exhibit response to stimuli. What the mass has, the individual molecules of it must in their degree have also.

We are in sight of the disappearance of the line and the gap. We shall then see scientists classifying themselves instructively in two groups: those who, looking downward, see life in the very depths of matter, life creeping upward into fuller consciousness and complexity; and those who, beginning with the depths and seeing there only mechanical deadness, would fain have us believe that all the phenomena, even of the highest life, are but more elaborated mechanisms of the same deadness. From another point of view the real line between the "dead" and the living might be drawn between these two groups of mind. The line is indeed already nearing. STUDENT

## Caffeineless Coffee

**T**HE sense of well-being that with many people follows the use of coffee, seems due to two elements, the caffeine and an aromatic oil. The first is a stimulant and in general must have a more or less injurious reaction on the heart and nerves. To the latter the coffee owes its flavor and its value as an antiseptic in the stomach. A German firm has just succeeded in extracting the former without affecting the latter. M. D.

## Nature

## Studies

## In the Boyne Valley, Ireland

WHEN one passes through Drogheda to visit the valley of the Boyne, so rich in history and legend, richer still in nature's enchantment, and pauses a while absorbed in the beauty of tree and cliff mirrored in the placid water at Beaupark, one's thoughts turn naturally to the glories of the far past. Somewhere near was the last resting-place of the Fianna, linking with a distant age when men realized their divinity, their inner unity with one another and with the supernal forces of nature. Stirred by the subtle magic of this tranquil scene one may perhaps picture the princely pageants, the shining knights, the martial women, the happy graceful children, all harmonious and symbolic, even to the colors of the raiment; nobility and simplicity reigning; and surrounding nature consciously alive to their presence, ready to respond to the movement of their will and aspiration.

Why did the golden past transcend the possibilities of our day? Or are such things still possibilities? The mystery would be inscrutable without the aid of some clue, some fragment of ancient knowledge. Do we know what was once meant by a sacred island? Has the meaning of the word become too altered? To say that such an island was a place dedicated to the highest service of the race would be like half-stating a truth. For how can we sense the true idea of sacredness if we have lost touch with the divine within nature; with that which molds, transmutes and sublimates; with that which is the knower in nature and ourselves, as well as the knowledge and the thing known?

One may grant, for universal tradition confirms it, that in ancient times there were on earth more sacred islands than one, and that probably for good reasons one alone was regarded among initiates in the mysteries of life and death as the Sacred Island. It is certain that the ancient legends of Ireland contain internal evidence that it, or its ancient geological equivalent, was once one of these sacred islands; and it may have played a part in relation to human progress as specific as those of some ganglion in the human frame. There is even evidence that earth and air were there permeated by potent currents of a subtle nature. And correspondingly the beings at one time dwelling upon such places were probably differentiated in some way from the general status of human development.

Yet if so, why? Could there have been communities, if not whole races so much beyond us in development, and no representatives thereof be on earth today? Current opinion regards this as improbable merely because the wonderful truths regarding man's origin and destiny have been so long obscured. Not that anything whatever in the past is more wonderful than in the present; but that the wonder and mystery of past, present and future are vastly greater than we usually dream, yet holding their solution ready for awakened intelligence.

And notwithstanding the torrent of what is called the intellectual life of today, can we call ourselves

## ST. LAURENCE GATE—DROGHEDA

intelligent when the most self-evident truths still await recognition? To take one at random: we are not our bodies! Where in the schools of contemporary thought do we find this clearly admitted? Or to take another: an *ascending* evolution of forms culminating in the human, concurrent with a *descending* involution of something higher! A self-evident truth, from the standpoint of common sense, yet unknown and unrecognized in its full scope and meaning.

This age-long process of ensoulment has some bearing on the question of sacred islands. It is not so much a geographic key as a world-soul key, when the action of cyclic laws, outbreathing and inbreathing, summers and winters, etc., are considered with regard to the inner as well as the outer. In the living earth there may be natural centers for the play of finer forces; while towards the close of great racial cycles their *efflorescence* would have natural habitats where the conserving forces would remain in preparation for the next era of progress. And such places regarded as culminating points of cyclic activity, would focalize forces of light and darkness. Around them would be wars, titanic struggles between elemental and spiritual powers. The wars in heaven were no myth, though enacted in realms not so remote as often imagined. At a time when science has admitted at last that matter in its essence is purely *meta*-physical, and that locked in its inter-etheric spaces are stupendous powers, those who feel that the visible is but a fragment of the invisible, the audible but a fragment of the inaudible, are not afraid to credit the ancients with nature-knowledge when they recorded the terrible conflicts at the close of a racial cycle.

Such events were generally regarded as too sacred, from one point of view, and too awful, from another, to be recorded in plain language. But they are recorded in symbolism in many places and ways. The Atlantean age of human activity lasted for

millions of years, belonging therefore to one of the greater cycles of human development. At its close the main part of the race had attained a conquest of earth, sea and air, such as we can hardly conceive. But their physical and intellectual energies outran the limit, so to speak. And there ensued a submersion, and a racial dispersion. Many parts of the earth, including Ireland, did not share in the former. Ireland's legends, some of them, belong to those days, and are replete with interest for such as have shaken off the limitations of "accepted" thought and belief.

They certainly suggest, among other things, that neither "gods" nor "heroes" made the mistake of identifying themselves with their bodies! If life was sacred, they had hold of the wider life within nature, and that of its, or their, fleeting forms was relegated to a subordinate place. Mere life is not the ultimate reality. If "kill out desire of life" is one of the first steps of the deeper study, it is not because you abandon it, but because reality lies within and above its universal vesture. The human being is not, as the outcome

of aeonian evolution, to be ensouled with life, but with divine wisdom. The breath of life breathed into the human form belongs to a long past evolution—we need not trouble about that. It can take care of itself; but this does not mean that we should wantonly interfere with physical life.

And if Ireland long after the dawn of the Aryan race was one of the homes of beings the flower of the Atlantean age, and thus sacred to human progress in those days, we should expect to find traces of the strong influence thus impressed, persisting and emanating therefrom in later times. And that is just what we do find. In the Brehon laws can be discerned traces of a high order of civilization, long antedating that of Greece. There is also a curious resemblance to some of the ancient laws of the Incas of Peru. One of the practices associated with the Brehon laws was that neither law nor usage nor historic record was ever held as genuine until it had received the approval of the great triennial Feis at Tara, whither the historians had to bring their books.

As to the influence still emanating from the island within what is called the historic period, much could be said. It has been greater by far than is generally supposed, in the domains of literature, music and art. Writing of the Fifth and Sixth centuries of the present era Professor Zimmer of Berlin wrote of the early Irish missionaries:

"They were instructors in every known branch of science and learning of the time, possessors and bearers of a higher culture than was at that period to be found anywhere on the Continent, and can surely claim to have been the pioneers—to have laid the corner-stone of Western culture on the Continent, the rich results of which Germany shares and enjoys today, in common with all other civilized nations."

Good work has often been done for the human race in spite of, rather than because of, transient creeds and intellectual beliefs.

ENTER the Path! There is no grief like Hate!  
No pains like passion, no deceit like sense!  
Enter the Path! far hath he gone whose foot  
Treads down one fond offence.

Enter the Path! There spring the healing streams  
Quenching all thirst! there bloom th' immortal  
flowers

Carpeting all the way with joy! there throng  
Swiftest and sweetest hours!

*The Light of Asia, Book VIII*

### The Higher Law

THEOSOPHY presents to us the great idea that Right exists as an actual fact in Nature. It is the divine *Fitness of things*, and is as natural, as much a part of nature, as is the material substratum. The Right is a matter of fact, not of opinion. However opinions may differ about it, there can finally be only one opinion. No matter to what race we belong or to what station in life; Right is right the world over. It is just as possible for the Hottentot, or the North American Indian, or the Chinaman, or the Japanese, or the Persian, to practise right action as for the Englishman; in all cases it is a matter of bringing oneself into harmony with the Divine Fitness of Things.

It is through our endeavors to perform Right Action that we become able to sense the Higher Law. Theosophy shows that here we have something absolutely to be relied upon. The man who does right—right as he conceives it from his own highest personal point of view—has as his ally a power which in itself cannot err or swerve one hair's breadth from the line of justice; has as his ally indeed the whole Higher Nature of the Universe, because what we call "Right" is harmony with the law of nature.

Yet when temptation comes how few there are who realize this grand alliance! To attain it, to know the action of the Higher Law, to be assured that Right has all real power on its side, and so to hold to it when inducements for wrong-doing are presented—in these things lies the proof of the statement that no wrong can harm the man who holds to the right. So also the converse is true. When a man permits a wrong thing to happen, acquiesces in it, makes no protest, he does not escape from the trouble it would be to stand then and there for the Right; on the contrary, he is but making his conditions worse, less comfortable, more difficult; he is heaping up an accumulation of trouble for some future time.

The poet speaks of "one soul against the flesh of all mankind," and in the light of this teaching we see that there is nothing impossible in the idea. One soul, evoking Right fearlessly and without quivering, can undoubt-

edly stand against the lower nature of all mankind, and has often done so. Where then is the *rationale* of fear? For that man who does not yet *know* that he is a Soul, here is the grand opportunity for demonstrating it, by standing for right against the world. I believe that it would be found to be true that where wrong seems to overcome Right it is not really Right that is overcome; there is some other element in it, it is not all pure, true, and clear.

The only disturber of universal peace is man, and that because he alone disobeys the law of his being. There have been Teachers enough to show us the path we should follow, and books enough have been written filled with the precepts that would bring us to right action and the perfect life, if we but followed them. But we have not followed them. We have chosen to follow the lure of the lower life instead, forgetting our true selves, and looking too often on the precepts of the Teachers as unworthy of our intelligence; or perhaps we have sided unequivocally with the animal part of our natures. The result is all the troubles of our lives. In all houses we see trouble, because of this opposition to the laws of life. The lower animals do not oppose; they live in harmony with the laws of their being. It is because we will insist on being half animal, instead of all human, that we are the disturbers of the peace and bring trouble on ourselves. Even the greatest souls have had at some time or another to learn to control the animal nature, and it is the thing we all have to do. Continual effort, with faith in our own power to succeed, will enable us so to accomplish this as to express all the higher harmonies of life.

The right path is the path to the Higher Self. When right is done, right will result. He who goes down before wrong must suffer worse wrong.

So that he who chooses the wrong way is a novice, has not had enough experience or has not learned how to profit by his experience of life. He will have to suffer until he has learned the wisdom of doing right. Even the greatest and best of men have gone through this experience. There was a time when they came to see that wrong was not worth their while; so they turned round and followed Right.

Such a change may occur in any life, and in any, the Higher Nature may come to express itself. Paul spoke of himself as the "chief of sinners," yet he was in his own time and sphere a great warrior on the side of Right. All of us are dual; in all are Higher and lower selves; until we shall have become workers in harmony with our Higher Self we shall not be doing our duty as human beings. Many seem to do right and fail; there is a false note somewhere in their action, perhaps desire for praise, or the salvation of self, or ambition. The genuine right is done for its own sake alone, and not for any selfish end that may be gained by it. Others again persist in right action for quite a long time, but at last they despair and give up the effort when perhaps they were on the very eve of decisive victory. Few of us know how great the effort is that is required; yet that effort has to be made, and it never will be so easy as at the present time. No one has reached

safety until he has found the demon within himself and learned to control it.

We have a duty to do—each Soul has a right to do Right, and no one has a right to stop us from doing Right. Those who would try to make us do wrong abdicate their positions as relatives and friends, no matter how near their relationship may be, and it is our bounden duty to stand up and educate them, for their own sakes, for everybody's sake. A child could do it. All have the power. Wrong also is a power, and we have no light whereby to discriminate between the powers of wrong and right, unless we evoke it by standing up, absolutely full of courage, for the thing we know to be nearest the Right. When that is done the awful obstacles will vanish. Those who dare not take this step cannot stand by the side of those who dare. Every day the choice is before each one of us. T. W. W.

### FRIENDS IN COUNSEL

ENTHUSIASM is heaven-born and with its aid we may rise to heaven. It is contagious, as are other attitudes of mind. With whom of your friends do you feel most happy, most capable; with the ones who always look blue and discontented, or with the sunny ones who are full of hope and trust and enthusiasm? Which kind helps you most, which kind helps the world most? You would all select the enthusiast for company, or for filling the difficult places in the world, yet that same enthusiast will have to travel through the world labeled "unpractical," because he does not descend to the low level of ordinary, disgruntled humanity. He will have to bear the sins of the dreamer and the visionary, who wish and hope to see things done, to see the world better and more nearly like the ideals in their minds, but who have neither the faith that *now* is the time, nor the courage, nor the energy to put their own shoulders to the wheel and push with all their might as the enthusiast does.

There is nothing more practical than enthusiasm, for it is the quality which makes the world go round, that makes for progress, that commands attention. It is the enthusiasm of the general that fires his army with courage and infuses into it trust and confidence in ultimate victory. It makes heroes of men, as it makes artists, and discoverers, and pioneers, and teachers. Yes, everyone who ever did anything at all worthy of being remembered by mankind was an enthusiast.

Without enthusiasm, sincerity is impossible. A person may do useful deeds, but if he does them without good will they are not one half as potent as if he put his best, his most divine strength into them. We know what enthusiasm Katherine Tingley puts into her work and infuses into those who work with her. That is one of the secrets of her success; that was one of the secrets of the success of H. P. Blavatsky and of W. Q. Judge, who prevailed against such enormous odds. They all imparted some of their own enthusiasm into their followers, partly through their examples, but mainly through that mysterious compelling strength which streams out from everyone who sincerely and earnestly and enthusiastically works for the uplifting of humanity with love in his heart. E. T. S.

## FRAGMENT

WHEN, in this world of manifested life,  
The undying Spirit, setting forth from Me,  
Taket on form, it draweth to itself  
From Being's storehouse,—which containeth all,—  
Senses and intellect. The Sovereign Soul  
Thus entering the flesh, or quitting it,  
Gathers these up, as the wind gathers scents  
Blowing above the flower-banks. Ear and Eye,  
And Touch, and Taste, and Smelling, these it takes—  
Lo, and a sentient mind;—linking itself  
To sense-things so.

*Bhagavadgītā, Book xv, Rendering by Sir E. Arnold*

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** What would Theosophy offer as the key to all the problems of modern civilization?

**Answer** Reincarnation has been called the master key for all the vexed problems of life. The present time is a transition period wherein men are outgrowing the old narrow conceptions of truth but have as yet failed to find a science or a theology broad enough to provide for the enlarging needs of human nature. In this eager, restless, over-busy, unsatisfying civilization, the greatest need is the conscious knowledge of a worthy purpose in living. If we were not subconsciously aware that life is worth while, surely the ordinary mind and heart could not long support "the splendid misery of existence."

In proving the logical basis of a belief in Reincarnation, Theosophy restores to every soul the dignity of its immortal birthright which relates it to all the past and to all the future. In view of a destiny so great as this, the every-day events take on a new and larger meaning. The rich and powerful are confronted with the grave responsibility of their talents of opportunity. The poor and weak are inspired with the knowledge that they are playing these minor parts in order to learn them. In time they will progressively be cast for every other character until they become perfected actors in the human drama.

Educators who understand Reincarnation will be less concerned about many methods by which the young can be filled and drilled with facts and details. The brain-mind will be seen as the instrument by which the student contacts knowledge of nature forces. The immortal student translates this knowledge into the wisdom which discards the details and preserves the power gained by the experience for use in this or other lives. The real object of all education—which is never finished—is that man may know himself. Realizing that the student can understand life around him only by understanding himself, the teacher will see the logical necessity for a noble discipline of mind and body which shall free the student from the distractions of selfish whim and desire.

The social and economic reformers who despair of awakening the oppressor's sense of justice, hope to solve their problems by arousing a sense of unjust suffering in the oppressed. Reincarnation offers the most conclusive argument for right and justice which equally concerns the man now in power and

the one below with whom he may exchange places in a future life. Science so clearly shows the prevalence of law, that the operation of cause and effect on ethical lines is easily seen when Reincarnation points out the field of its operation.

With the prevailing theology teaching that there is but one earth life, the excessive intellectual and material development is resolving itself into a scramble to crowd all available powers and possessions into the present life. Inventions and discoveries have so increased the human resources of thought and action in this world, and the old idea of heaven is so vague and unreal, that men aim to make sure of all that can be had here and now. Life is a school in which the soul learns of the human powers and possibilities, and Reincarnation offers the different courses for the development of a perfected man. Creeds and dogmas have had their day. Each soul judges itself—not by what the man believes, but by what he is.

**Question** What answer would you as a Theosophist give to Cain's question, "Am I my brother's keeper?"

**Answer** From my understanding of Theosophy I do not think a plain yes or no answer can be given to this question, if we take into account all the intricacies of human nature. Or perhaps the answer will be of the yes and no kind; it all depends upon who *you* hold yourself to be, and with what forces *you* identify yourself.

Yes, you are your brother's keeper. You have him in your grip so fast that he cannot get away; are drenching him at every moment with life or death—and all without going beyond the limits of your own heart. He, of course, is doing the same for you; and has a finger in the making of every mood that possesses you. You have no need to adopt this or that attitude towards him to affect him; criticism and advice are generally as unnecessary as the old-time philtres and charms. The way you hold your own mind is surely accomplishing that. Within yourself you are at work incessantly, either building him up or tearing him down; infecting him with joy, or with the poison of life. That anger of yours on such and such a day was perhaps the last compulsion which sent So-and-So to the gallows or asylum. It came lightly enough from you, and spoiled neither your appetite nor slumber, but he, by some self-made destiny from of old, was a center attractive to all such forces; and the little addition you made to the ranks of his interior persecutors brought him down. At one time he fought all such thought when it came clamoring at the gates of his mind, but there were so many around him to pour out the forces which for him were damnation. Have you no responsibility? You would not hold the man guiltless who filled the water of a city with the germs of disease.

Again, that high thought which you brought back and held in your mind night after night before sleeping, or morning after morning when you awoke; you did not know that it was a rope you were strongly weaving, and throwing out into the sloughs and quagmires of the world; into all places where outcasts

go, and the fallen and hopeless and damned. Yet it was so; and someone was kept from suicide; someone remembered the aspirations which lifted him before he started to go headlong down the slopes of hell; someone, inspired by it, outstared tyrant vice. So you were then your brother's keeper, but through no effort to be so. You gained no kudos; endangered yourself by no swelling thought of how these mortals were dependent on you; set yourself to be no fool's sun for so many of your brother planets; yet you *did do work*; did accomplish something of our primordial human mission, and all bonds everywhere were loosened by your action.

It all depends who you are, as was said, and with what forces you identify or ally yourself. Man is dual; and on an understanding of this all wisdom and discrimination depends. Your lower self, the thing you generally call yourself; the thing which hungers, thirsts, is selfish or dissolute—is certainly keeper to nobody. The lesson for you to teach it, is that it shall mind its own business. Beware how you impose its will upon the least of your brethren, or go out to correct faults in others, in accordance with its strabismic dictates. That which within you seeks to be in advance of other men is this; recognize it by that peculiarity, and give it a fall whenever it begins its vaunting.

There is nothing that the mind can conceive so holy and potent that this phase of the lower self will not grab, if it can, to use for its own ends and glorification. Brotherhood is a fact in nature, and man must grow to the splendid pattern that the Universe has set for him. *Therefore will I*, whispers the personality seeking advance and dominance, *therefore will I clip and trim these others until they fit into my design. I will punish them for any shortcomings I may find in them: until they more nearly resemble myself they shall have no peace nor happiness.* Commonly such personalities are well endowed with the power to keep happiness from the circle of their surroundings. It is all ambition and vanity; indeed, a kind of blasphemy, for they are stealing the Fire of Heaven for their own domestic abuses, and seeking to enrich themselves with the spoils of the Temple of Truth.

For indeed, again, we are our brother's keepers, and have a great duty to protest against wrong-doing, even when the wrong is not done by ourselves. In nine cases out of ten perhaps, or even more often, the protest must be silent and mental; yet (we mean in ordinary personal life) there will be the tenth case when it must take words and make itself heard. How shall we know? Only, I imagine, through long practice in protest against the wrong-doing in ourselves; only by having plucked out the beam from our own eyes. Then we shall see clearly; before that time we are more than likely to blind the brother we would experiment upon.

M.

DISCIPLINE the body, the temple of the living god; make it a sweet, pure, strong vehicle for its life work. Make it acquainted with its divine nature; point out its companion in arms, the little evil-doer, the undeveloped lower nature, seeking entrance but to blind and draw it away from its good, true, happy, joyous place in life.—*Katherine Tingley*

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## A Theologian's Plea for Eternal Verities

IT may be thought by the ill-informed that Theosophy is opposed to religion. That this is not the case, however, a very slight acquaintance with Theosophy will show. Theosophists wish to rescue religion from its desecration and restore it to its proper position. But this is just what the best theologians themselves want to do.

To prove this, we may refer to a paper on The Call to Theology, by Professor Peabody of the Harvard Divinity School, in the *Harvard Theological Quarterly*.

He complains of the indifference of the mass of the clergy to theological science. The clerical profession suffers from a tendency to inexact and slovenly thought. Many pulpit orators seek to fill the void created by lack of thought by exciting mere emotions or by tawdry rhetoric that reveals the emptiness of their minds.

We live in an age of reflection, continues the writer; we are possessed with a passion for reality; no traditions, however venerable, may pass unchallenged.

"A time when people in an unprecedented degree are thinking can be guided by those only who can think straight and can report their thought with power."

If the ministry continues to fail in doing this, the leadership of the modern world will be transferred to other agencies. There is, therefore, an imperative call to theology to rid itself of cant, conventionalism, and sectarianism, and get face to face with permanent spiritual realities—the nature of the human soul, the ethical ideal of human nature as related to the individual and society; that it may translate these deathless truths into the mental categories of the time.

The writer commends the leaders of advanced religious thought now protesting everywhere against backwardness. He calls them true theologians, and says it has ever been the fate of the theologian to fall foul of the ecclesiastic. But, in the great crises, not the ecclesiastic but the theologian has always saved religion.

"What we are witnessing today," he says, "is not a reaction against theology, but a reaction against traditional and Latinized theology. Never were men more willing to listen to an earnest religious teacher who gives evidence that he has 'thought through' the truths he proclaims. The sense of mystery, of the spiritual in life, of a power manifested in the universe of matter as in the realm of personality, has come home to the modern man. We must make a fresh effort to interpret the nature of man and of God, to create a theology which will incorporate all that is vital in the past that it may the better

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

serve the needs of the present." (Quoted from a newspaper review of the address.)

The above is excellent; let us follow the line of thought a little further. The church is to get face to face with permanent spiritual realities and to throw off traditional and Latinized theology. Needless to say these permanent spiritual realities will carry it right back to the remotest antiquity of the human race. For, once we begin stripping off ecclesiastical tradition, where are we to stop? Some want to get rid of modern broad views and get back to the Puritanism of a century ago. Some want to go back to pre-Reformation times and to what they call the original church, with nearly all the Roman doctrines, but not under Papal jurisdiction. Others try to get back to their conception of the Christianity of apostolic times; and these conceptions are various.

But we shall find, if we apply the exact methods recommended, that since the very beginnings of Christianity, there has been coat after coat of ecclesiasticism put on. Going back to times when the church Fathers wrote, we find that Christianity in their day included many teachings of the ancient so-called "pagan" mysteries. We cannot find a single doctrine of Christian theology which is not manifestly derived from some old "pagan" belief or rite. The triune nature of Deity, the divine-human nature of man, the teaching that the higher self of man (the *Christos*) is the "Son of God," which is destined to save him; the records of the lives of World-Saviors; their immaculate birth and their teachings; the rites of the Eucharist and Baptism; the symbol of the Cross, of the Water, the Fire, the Sacred Breath (*pneuma, spiritus, spirit*) all are world-old symbols and teachings.

From the remotest times, permanent spiritual realities have been recorded in the "mental categories of the time." Man has always been a Soul, and it is not now for the first time that his essential nature has revealed truths to his mind. If we are to apply frank and exact methods to the examination of history, we are bound to find that many ancient nations had advanced higher in spiritual knowledge than our race has yet done in its cycle. We cannot escape from the conviction that our theology, at its very best, is but a partial reclamation of lost knowledge; that our most original theologians have but ventured timidly along the beginnings of paths

that have been explored ages ago to their end.

To "incorporate all that is vital in the past, that it may better serve the needs of the present." What a program! This means that the church which follows that program will have to accompany Theosophists in their examination of the records of spiritual light throughout all antiquity. All that is vital in the past! There is much, very much. Theosophy declares that there is an ancient and never-perishing system, neither a religion nor a science, but both, which preserves in symbolic and mystic language the sum of the permanent spiritual realities and deathless truths, as much as has ever been revealed to the disciplined human mind by the awakened human Soul, or taught by Masters of Wisdom to candidates for initiation in sacred mysteries, and by World-Saviors, to those who had ears to hear. This system, the WISDOM-RELIGION, Secret Doctrine, or Theosophy, underlies all theology.

Can we find anything in modern thought that will enable it to incorporate all that is of value in the past and yet rise superior to it as a leader? There is only one thing we can find; that is the dauntless modern spirit of progress. Our unique possession is our position in time's cycles; we are the vanguard of the human race. But for instruction, we shall have to study the books of the past a great deal; for we need to do a deal of catching up before we can go ahead.

So let the theologians begin and study, say, the origin of the doctrine of the "Trinity"; and they will save themselves time and useless repetition of effort if they will first see what the ancient Hindû books have to say on the subject and compare it with what we have learned from the Egyptian hieroglyphics; and in fact study the matter thoroughly in all its sources. Then they can go on to the doctrines of the *Christos*, the "Atonement," and so forth. It will be as well to take the ancient seven-fold division of the human principles as a basis, in order to save the infinite confusion and wandering on wrong tracks caused by an incomplete or fallacious classification.

And the Professor is a Soul; and the Soul will have no other bride but the Truth. The Truth accepts the devotion of the humble theologian, but will not stoop from her lofty throne; her devotees must rise to her. Truth will not descend in order to head a church, however advanced. Let us remember the old Arabian story of the man whose palace was absolutely complete with the exception of a roc's egg; who was warned that he could not have the roc's egg, but insisted on having it procured and suspended from the dome; with result that the whole palace crumbled to dust. What will become of theological tradition if the lamp of eternal Truth is to be hung in our cathedral domes?

## KATHERINE TINGLEY SPEAKS AGAIN AT ISIS THEATER

ON Easter Sunday, April 19, Katherine Tingley, the Leader of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, gave a second most inspiring and instructive address to an immense audience that filled the beautiful Isis Theater, in San Diego, to overflowing.

It is almost futile to attempt to give any just idea of the new and original ideas that Katherine Tingley sent forth in such profusion, but as her musical tones rang out with their wonted richness and power, it was apparent that the great audience was profoundly impressed with the importance of her message and the depth of conviction and knowledge that lay behind her words. It was noticed that as the immense body of hearers, including visitors from all parts, filed out at the end, a remarkable air of thoughtfulness and silence prevailed among them, and large numbers waited to thank Mrs. Tingley for the new and inspiring thoughts that she had given to them in such generous measure.

In her address, the Leader of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY drew a wonderful picture of the glorious possibilities of the future, when men shall have learned to live in the godlike qualities of the Higher nature, and she also lifted the veil between the past and the present, showing in vivid colors how the simple ideals of the great Teachers of antiquity had been handed down in their purity until men gradually began to rely upon forms and creeds, leading to confusion and bigotry; so that now we have, as the result of these errors, the present condition of the world with its lunatic asylums and its prisons, and its appalling lack of brotherhood.

A full stenographic report of this remarkable address was taken, which will probably be published in full shortly. The lecture was preceded by a fine rendering of Mendelssohn's *Athalie* by the Point Loma Theater Orchestra, and the special choir from the Râja Yoga Academy sang one of their beautiful part-songs. At the close Schubert's *Wanderer* was played on the cornet by Mr. Lorin Wood, and the final number given was Kretschmer's *March*.

OBSERVER

### **Ignorant Criticisms of Theosophy**

THE ignorance of a large section of the people, which is able nevertheless to make itself vocal through the papers, is very great. And it is often associated with the self-satisfaction of ignorance, such as belongs to the man who "knows not, and knows not that he does not know."

A correspondent to a daily paper ventilates his ignorance as follows:

There is nothing in the history of the world or in individual life that points to reincarnation.

This is pure ignorance, for a majority of mankind at the present day believe in Reincarnation, and the same has been the case throughout history.

Individual life points to the conclusion that part of our nature is immortal. Immortality must apply equally to pre-existence as to after-life. The idea that the present earth-life of any given person is the only one of its kind and that the immortal Self has but this one unique experience of earth-life in the whole of its vast cycle of existence, is very much less credible and reasonable than the idea that the present earth-life is one of a series.

Any difficulty in understanding Reincarnation applies with much greater force to any alternative theory. What does the writer believe and how does he explain it? The objection which people feel towards Reincarnation is due to its unfamiliarity, through not knowing that probably three-fourths of the earth's inhabitants believe in it in one way or another.

It is much easier to explain and to reconcile with the facts of life than are any of the other theories which we accept without question, however inconsistent, because we are used to them. The theological views as to the past and future of the immortal Self are generally admitted to be either untenable or altogether lacking. Modern science has no views on this question. But the doctrine of Reincarnation, as taught by Theosophy, is logical and consistent, informing and inspiring.

The writer goes on:

Just as we inherit physical features from our ancestors, so we often inherit their moral qualities, but no one, aside from this, exists or ever has existed, that has benefited the world or his neighbors by knowledge or qualities obtained in a previous life.

Ninety-nine one-hundredths of all our knowledge has been gained from the hard work of others in this life and not from any previous life. Where is the precocious child or adult that has needed no teachers or experience, but was able from a previous existence to be on an equality with those who have had them?

The history of man's physical organism with its attendant instincts and qualities, and how these depend on the parentage, does not affect the question of the history of the immortal Dweller in the clay. Nature provides environments and conditions, and the immortal Self chooses them according to its merits, requirements, and destiny. It is influenced by its heredity; but, on the one hand this heredity was its own choice; and, on the other hand, it begins to mold and modify that influence as soon as it enters it. There are many people in whom the Self is as yet so feebly manifested that they live and die without escaping to any important degree from the force of the heredity and environment. But others show a marked independence and soon manifest traits which they did not derive from their parents. Genius is an instance in point.

The statement that no one exists, or ever

has existed, who has benefited the world by qualities obtained in a previous life, is simply untrue, apart from its childish arbitrariness. The cases of musical and mathematical prodigies can be quoted; to these can be added the great scholars, philosophers, poets and religious teachers. All these have entered life ready endowed with faculties that have quickly unfolded as soon as the body developed; or, even if this should be denied, they were at least endowed with a mysterious power to acquire and apply, which marked them out from other men. It is the latent qualities of the indwelling Soul that determine what use it can make of its heredity, environment and education. It may quickly master them and turn them to profit, or it may get nothing out of them.

But the writer grants us one-hundredth, as against the ninety-nine hundredths of knowledge which he says has been gained in this life. It would be interesting to know how he explains that hundredth; one in a hundred is quite a fair proportion. Of course it is not to the point to say children need teachers; they also need feeding-bottles and shoes; Theosophy does not claim that the Soul brings over these articles from a past life.

But we meet the climax of wild statement in the words:

The existence of Christ is testified to as no other event in history is.

Contemporary writers do not mention him, even those whom we should most expect to do so. Christian scholars are now teaching that Jesus was probably some obscure "prophet and healer," almost unknown during life, but chosen after his death as a peg on which to hang a religion. The writer should read before he writes. But he continues:

The whole civilized world dates its history to and from that event, and the enlightened nations of the earth are not in the habit of dating their history from a myth.

One replies, "Yes, they are!" They date the beginning of their year from a day arbitrarily fixed by Julius Caesar; they have 31 days in August in memory of the shade of Augustus who did not like his month to have fewer days than Julius'; we have our Christmas from a blend of the Roman Saturnalia, the Norse mythology, and Christian tradition, our Passover from the Hebrews, and so on. Most eras are arbitrary; and, once chosen, they become all the more indelible as ages accumulate and civilization expands. But the enlightened nations show signs of revising their habits. They have already thrown over 4004 B. C., and are much in doubt about 0 or 1 B. C. or A. D. H. T. E.

BLESSED is he who has found his work; let him ask no other blessedness. He has a work, a life-purpose; he has found it, and will follow it!—*Carlyle*

### The Thread of Three Incarnations

NOT inscrutable would be the ways of Karma, if, having faith that the path is prepared for us, we would examine its landmarks and the pleasant and painful places through which it winds.

In this present life of mine they are wholly painful—*outwardly*; but I walk them now with an ever growing inner joy.

I have never known health, and now at middle-age I know that I am for such few years as remain, a broken cripple. Medically speaking, upon tubercular hip disease of young boyhood supervened a general rheumatoid joint affection, and every joint of every limb is nearly locked—incurably. I am dependent upon help for even the common acts of life, and have to be carried from room to room and assisted even to eat. For the least change in the weather I am a barometer; but the rising and falling index is *pain*.

Enough of all that. I am not the body, and that knowledge was well worth all the pain and fever, all the mental anguish as disease steadily cut me off from ordinary life, ordinary enjoyments, and the power to earn the smallest livelihood.

One night, feverish and sleepless, I began to doze—physically; but thoughts and pictures flooded a mind too tired and too restless to control the flow even for a moment.

Suddenly, myself unchanged, my surroundings took a new form. I was much younger, between boyhood and manhood; in bed, and with an aching and powerless hip. It was late in the evening or early in the night, and by a little night lamp I had been reading here and there in the New Testament. I was full of peace and hope and knew that the hip disease which then—as in the boyhood of this present life—held me to the bed, was slowly healing. I had plans for my living; I would teach this and that and gradually relieve my widowed mother of all the expenses of my maintenance. And I vowed that whatever prosperity might come—I did not paint the picture in too pallid colors!—I would not lose hold of that spiritual life, that companionship of God as I thought it, which through the last year or two of my sickness I had slowly gained. I would reach and search; God should be an ever closer reality and find in me a real instrument for His work.

So I vowed, and almost as part of the same picture I saw another. It was that same life a few years later. Prosperity had come; I was well; nearly every trace of my disease had vanished. I was full of work, and money was coming to me in plenty from crowds of pupils whom I was training in business life, for examinations, and so on. At last I had more work than I could personally attend to, obtained the help of subordinates, and finally retired altogether from the immediate details.

But no gleam of the earlier aspirations remained. Prosperity left me no time for any inner life. That and God became unreal or childless memories at which I smiled.

Then all that vanished and I seemed to look back yet further, to a yet antecedent life. The boyhood of that too had its ideals and aspirations—not, however, then born in sickness. I was full of life and energy, yet also of thought; and then too God seemed near. I

would draw yet closer to Him, find Him in the mysteries of life and nature, and fit myself to tell men what I had found. It was all ambitious enough, of course; but I know that through the ambitions of a youth there did run a real spiritual thread.

I lost it. Then too prosperity blotted out the inner life, more and more as the years rolled on. The ideals faded, and in the vigor of manhood I was content to have it so. They had no place in active social, political and business life.

Suddenly I came to myself and knew that I had looked back two incarnations and was myself the unbroken thread. And then I saw the reality and meaning of that Law they call Karma. I had indeed read something of it, and of Reincarnation; but they had seemed mere dreams of the East fantastically brought over to the West.

What I had now seen for myself was this:

That in years long past, the years of two lives ago, I had touched the Light—and deserted it. I had seen the Golden Door, had begun to press it open—and gone away after quite other good.

That in the life following, the Law had by my sickness held me back for years from the rush of outer life *that I might have fullest opportunity for the inner*. And I had lost the chance again, a chance which my own ideals and resolves had created for me. For the Law is somehow in the man himself.

And lastly: That out of two failures might now come success. The malady that would hold me in its grip through all the remaining years of this life was the answer to my own soul's call for help in dealing with me, my inner life's appeal for help in its struggle against the overmastering outer.

Now I can think that the Russian woman Blavatsky was right. This Law, which creates every circumstance of our lives, is somehow the expression of a will in our inner nature, *our own* inner will, a force set in motion by the soul, ever providing and providing opportunity. May all men at last recognize it, its beneficence, and see and use its gifts. What we call chance, luck, event, accident, are the veils of this divine, ever operant, ever blessed and blessing power in our lives.

CRIPPLE

### The Major Excommunication

THE authors of the book entitled *The Programme of the Modernists* have been awarded the Major Excommunication. The papal decree is as follows, the original being in Latin:

#### DECREE

It is forbidden to any one of whatever degree or condition subject to our jurisdiction to sell or read or retain in possession this book, under penalty of deadly sin.

Since the authors and writers of this book bitterly oppose the Papal Encyclical denouncing "Modernism," the Holy Father Pope Pius X by this decree imposes the penalty of major excommunication upon them, and upon all others who co-operate with them in producing and circulating the book; and absolution from this penalty is reserved exclusively to the Pontiff. And this decree shall have the same effect as if given into the hands of each of the authors and writers, even if they should be priests exercising the holy office.

And every Bishop in every diocese must make this

prescription known and promulgate this censure.

Given at Rome, this 29th day of October, 1907.

PETRUS RESPIGHI, Cardinal Vicar.

FRANCIS, CANON FABERI, Secretary.

—(Clipped from the press)

Fortunately for those concerned, they live in the Twentieth century and the Papacy cannot enforce its own decree. What the enforcement of Major Excommunication once meant may be learned from any school history. For instance, (Myers):

The person excommunicated was cut off from all relations with his fellowmen. If a king, his subjects were released from their oath of allegiance. Any one providing the accused with food or shelter incurred the wrath of the Church. Living, the excommunicated person was to be shunned and abhorred as though tainted with an infectious disease; and dead, he was to be refused the ordinary rites of burial. . . . It is difficult for those who have come to regard the thunders of the Church as harmless, to realize the effect of these anathemas upon a superstitious age.

But suppose that age should creep back upon us? H.

### Water Which Cannot Be Cut

IT is stated that near Grenoble in France is a manufactory which uses water from a reservoir 1600 feet higher up on a mountain. The water comes through a pipe somewhat less than an inch in diameter; and, when allowed to escape in a jet, has such velocity that a strong man hacking at it with a sword cannot cut through it. One recalls having once read of a new invention whereby ships were to be propelled by the reaction from a jet of water forced by steam-power from the stern; and that the velocity of this jet was such that a bullet could not be fired through it.

Physicists have shown experiments proving that fluidic bodies in extremely rapid movement acquire the rigidity of solids; the object being to support the vortex theory of matter, according to which atoms are whorls in a "perfect fluid." Rigidity and solidity are evidently not so permanent as may be imagined; rapid motion in a fluid can account for the whole. Thus inertia becomes momentum and dead matter becomes very much alive. T.

### A "Superstition" Re-Christened by Science

A "NEW" method of curing burns is announced as having been introduced in a foreign hospital. It consists in *baking* the patient by placing a frame around him to keep the bed-clothes off, and then introducing heat from a stove through a pipe. By this method it is said that lives can be saved which were otherwise doomed.

But one remembers a popular "superstition" which, on the principle that fire kills fire, prescribed that one should hold a burnt finger near the fire in order to cure it. And one also remembers a scientific attempt to "explain" this superstition on the then "rational" lines. Perhaps we shall one day discover *why* our grandmothers placed the poker over the fire to draw it up; and a few other things. T.

THE surprising discovery of an isothermal zone, extending from eight to fifteen miles in height, is said to have been made at Strassburg by the use of captive balloons. J.

# Art Music Literature and the Drama

## Welsh Literature—A Running Glance

IN the CENTURY PATH of March 29 was given a brief sketch of the work of Taliesin, one of the leading poets of the Sixth century A. D., Wales, of whom the others were Myrddin Gwyllt, Aneurin and Llywarch Hen. Myrddin Gwyllt, or "Merlin the Wild," will be next considered.

Of the two chief poems accredited to him, the *Hoianau* or "Song of the Pigs" does not feel as if much, if any, of it were genuine; while the *Afallenau*, or "Appletrees," on the other hand, does. This is a poem of about twenty-five stanzas, varying in length from six to a dozen lines each, and is much more intelligible than the Taliesin poems.

Myrddin was the bard of Gwenddoleu, a prince of Cumberland, to whom he was very much attached. But Gwenddoleu seems to have headed the Christian party against the Pagan or Druid party, and in spite of his bardhood Myrddin took up the sword to fight for the old Mystery Religion. At the battle of Arderydd in the Lowlands of Scotland his side was defeated, after which he retired into the woods of Celyddon, which may mean Caledonia; or it may simply mean Occultism, from *Celi*, (hidden, secret) — so *Duw Celi*, the "God of the Mysteries." From his life in the woods he came to be known as "the Wild," to distinguish him from the other Merlin of Caermarthen, Arthur's Teacher. Here is an abridged translation of the poem:

To no one was given, at any giving,  
Such a gift as was given to Myrddin, ere old age  
overtook him.

Seven score and seven sweet apple trees,  
Equal in flavor, in growth and in beauty.  
A shining Goddess is their guardian,  
Her name is Gloywedd of the pearl-white teeth.

Myrddin was armed with sword and shield,  
In the woods of Celyddon he kept his guard,  
The Maid of the Appletrees appeared to him there,  
'Listen, little Druid, to the songs of the birds.'  
Hearing their songs, wisdom came to him,  
And the appearing and vanishing Maid began to  
predict  
Things that shall certainly come to pass.

Sweet and beautiful Tree of the trees!  
No little tribe are the apples upon thee!  
I am full of fear, for thy sake,  
Lest the woodmen come, the destroyers of the  
Forest,  
To cut off thy branches and dig up thy root,  
So that the land should be bereft of thy fruit,

Since there is no one now to guard thee except  
Myrddin,  
And he an old man, and weak.  
I wore the golden torc in Arderydd,  
But now the Swan-robed Comrades no longer are  
with me.

Sweet and beautiful Tree of the trees,  
Four hundred years thou hast survived in safety,  
Though I am old and wild and weak  
A wide ditch shall encircle and protect thee,  
Thou shalt not be destroyed by the race of priests.

The Sweet Appletree is like the Bardic Mount of  
Assembly.

The Dogs of the Woods shall guard the Circle of  
its roots

And I will foretell, and true shall it be;

Medrod and Arthur shall return to the conflict,

All shall have their just reward. Joy is me for the  
Briton;

The Horn of Joy shall sound the song of peace and  
serenity.

The tree referred to is, beyond question, as some even of the critics have perceived, the Druidic Mysteries, the Theosophy of Ancient Britain, which had for four hundred years (of Roman dominion) survived in safety in spite of massacres, penal laws, etc., until Myrddin's own day, which he was left to guard alone — his "swan-robed comrades" (the Druids) having been destroyed as a party for the time being at Arderydd — and which was threatened by a race of priests. The poem then is a prophetic assertion or aspiration that Theosophic truth should never wholly die away

among the Celts; a Battle-Leader should come at some future time — opposing the tumult of Saxons (materialism) and the priestly race (dogmatic religion) — to readjust things, an "Eagle from the sky" to play with the opposers of humanity, so that true Bardism, exalted wisdom, should triumph.

## THE HOIANAU OF MYRDDIN

The phrase translated above, "Listen, little Druid," is *Oian a Phorchellan*, literally "Listen, little Pig," that being a term for Druid in the schools; as the pigs fed on

the acorns, so the Druids fed on the spiritual acorns from the tree of wisdom. In the *Hoianau*, the chief other poem associated with the name of Myrddin, the verses begin with the words, *Oian a Phorchellan* — Listen, little pig, as in the Appletrees they begin *Afallen beren*, Sweet Appletree. How the poem originally stood it is difficult to say. They were most probably stanzas beginning, "Listen, little pig," and addressed by Myrddin to a disciple, foretelling perhaps the trend of history and the revival of the Mysteries, as do the stanzas of the Appletrees. But they were so used and added to in the Middle Ages as to be now hardly recognizable as genuine. An irruption of English had to be repelled; bards would go around reciting the prophecies of Myrddin, with a new and appropriate verse about how at such and such a time such and such a hero, the "son of Gruffydd," or of the "line of Iago," so indicating the local prince or chieftain, would arise to sweep out the Saxons from wherever the place might be. And it is probably little but these spurious verses, interesting only in a historical sense, that now remain. A WELSH STUDENT IN LOMALAND

Lomaland Photo. and Engraving Dept.

## HOLYROOD PALACE, EDINBURGH

Again shall they rush to the Battle of Camlan  
And only seven shall return from the conflict.

Sweet and beautiful Tree of the trees,  
Thou growest in secret in the woods of Celyddon.  
In vain shall they seek it on the banks of its river,  
Till the Battle Leader shall come to Cadfaon  
With the Eagles of the Towy and the Teifi;  
Till ranks be formed of the White Ones of the  
Mountain,

And the Wearers of long hair be divided into the  
gentle and the fierce.

Tree of the trees, Oh pure white-bloomed One!  
Sweet are thy fruits, the prisoners of words.  
An ass shall arise to remove men out of office;  
But this I know, an Eagle from the sky,  
An Eagle from the sky shall play with his men,  
And bitter will be the sound of Owen's arms.

Tree of the trees, Oh pure white-bloomed One!  
In secret thou growest in the woods of Celyddon;  
In vain shall they seek thee who seek to destroy thee,  
Till the Battle Leader shall return to Rhyd Rheon  
With Cynan opposing the tumult of Saxons.

Before the Child of the Sun, bold in his courses,  
Saxons shall be rooted out, bards shall triumph,  
Then Cymru shall rejoice, her Dragon Chief shall  
be splendid;

Humanity can no longer feed on husks: lip prayer is of no avail.

It is the energizing power of the heart prayer in service, the soul prayer in love, that can save the world.—Katherine Tingley

**PRESIDENT ROOSEVELT,** in an address made before a large and representative body

of American wives and mothers, which convened recently in Washington, paid a glowing tribute to woman and more especially to the mother. Women are souls, with old debts to pay and new lessons to learn, with many lives behind as there are many ahead of them, and with no two possessing exactly similar qualities, capacities, or obligations. Joan of Arc's duty was to save France, while that of almost any one of the peasant girls of Domrémy in her day was to marry and rear children. At least, most of them did so, and unless most women continue to do so the world over for a while, evolution will simply have to call a halt upon itself.

The rabid extremist who would have woman "live her life," meaning by that a life selfishly free from the harassing cares, the pain, toil, and manifold difficulties of motherhood, is as far wrong as the vapid and selfish antediluvian whose ideal is the Sicilian peasant mother with her brood of twenty-four—human beings? no—*vegetables*, with perhaps one firebrand in the lot. There is a sensible way of looking at these matters and it is plain that the trouble lies in the fact that the real issue is obscured. Motherhood itself is not the hard thing, but the complex, maddening, discouraging conditions of modern life with which every mother today has to contend; and the more conscientiously she strives to do the best thing for her children the more keenly will she feel the limitations of her environment and the fetters that bind her hands.

The mere not adding the duty of motherhood to one's list in each incarnation is not in itself the crime—to judge of that we must know the motive. Does anyone contend that Florence Nightingale, with her unusual, special gifts and her unselfish love for humanity, ought to leave life convinced of having

## Woman's Relationship to Duty

failed in her duty because she did not present her country with half a dozen sons, to be shot to pieces, perchance, in some war? Was Elizabeth less great than Victoria because she did not add to her state duties the more tender offices of motherhood—was she *more* great because of it? Such contentions, whichever side be taken, are merely absurd. Each woman faces in this life her certain duty. This it is

**STUDYING** the interpretation given by many of those who declare themselves to be followers of Christ, we find that the sayings of the Master have been so interpreted that they have limited the minds of men. Christ's professed followers—so many of them—have held to the letter of the law rather than to the spirit, and have lost sight of the real meaning that lay behind the words Christ said.

Christ planted the seed of Divine Life within the outer sanctuaries of the human building. He touched the atoms of the air, the stars and planets and the invisible things of life, with a certain indescribable spiritual something when he looked into the future and gave that promise to his fellows, "Greater things than these shall ye do."—Katherine Tingley in an address to her Students

hers to do or hers to leave, nor is it for any two women just the same in kind. There is no freedom without nor within until the call be heard and the duty met. Whether it be in the nursery of some obscure home or in the ranks of scientists, educators, philanthropists—these things constitute in themselves neither the difference nor the test.

But touching woman's work in the home, about which Katherine Tingley holds such firm and fine-weighted opinions, as all know who have heard her impassioned appeals to mothers to sanctify marriage, dignify and ex-

alt motherhood and lift home-life to a higher plane, it is surely of interest to know that the ruler of

a great nation holds similar views and that he feels the discussion of this subject not beneath him. The best answer to certain "reformers" who contend that "President Roosevelt would, if he could, confine every woman to the nursery and kitchen" (to quote the rather hysterical utterance of one) is the fact that within the month he has asked the assistance of the members of the Woman's Clubs of the United States (most of whom are wives and mothers) in the matter of protecting our national forest reserves—scarcely a nursery topic!

The ideal mother is the one who can step out, when need be, into the arena of life's larger problems and fight as courageously there against evil as she does in a sick room against the typhoid bacillus; and the ideal *woman* is she who, whether married or not, carries ever in her heart that deep compassionate love which is the very essence of true motherhood and without which the name itself is but a sham.

We quote briefly from a report of the President's address, regretting that only extracts from it have reached us, and hoping that those who read it will accentuate in their minds the saying of H. P. Blavatsky that "Duty is what is *due to humanity*," and that it can never be rightly comprehended from any standpoint but that of soul. It is not a question of sex at all, nor of outer things, and one assumes that in contending that "the mother is more important to the nation than any successful man," our President referred only to the worldly viewpoint of what constitutes success, *not* the true philosophical one, for that gages success by worthiness of motive and not by any other thing at all. Success that does not spring from the heart-qualities, from actual enlightenment of soul, is not in-

deed success, in any true sense. To quote from the excerpts received (*italics mine*):

When all is said, it is the mother and the mother only, who is a better citizen even than the soldier who fights for his country. The successful mother, the mother who does her part in rearing and training aright the boys and girls who are to be the men and women of the next generation, is of greater use to the community, and occupies, if she only would realize it, a more honorable, as well as a more important, position than any successful man in it.

Nothing in this life that is really worth having comes save at the cost of effort. No life of self-indulgence, of mere vapid pleasure, can possibly, even in the one point of pleasure itself, yield so ample a reward as comes to the mother at the cost of self-denial, of effort, of suffering, of the long, slow, patience-trying work of bringing up the children aright. No scheme of education, no social attitude can be right unless it is based fundamentally upon the recognition of seeing that the girl is trained to understand the supreme dignity, the supreme usefulness of motherhood.

Unless the *average* woman is a good wife and good mother, unless she bears a sufficient number of children, so that the race shall increase and not decrease, unless she brings up these children *sound in soul and mind and body*—unless this is true of the *average* woman, no brilliancy of genius, no material prosperity, no triumphs of science and industry will avail to save the race from ruin and death. The mother is the one supreme asset of national life; she is more important by far than the successful statesman or business man or artist or scientist.

I abhor and condemn the man who is brutal, thoughtless, careless, selfish, with women and especially with the women of his own household. The man is a poor creature who does not realize the infinite difficulty of the woman's task, who does not realize what is done by her who bears and rears the children. I abhor and condemn the man who fails to recognize all his obligations to the woman who does her duty.

But the woman who shirks her duty . . . is just as heartily to be condemned. We despise her as we despise and condemn the soldier who flinches in battle. A good woman who does full duty is sacred in our eyes, exactly as the brave and patriotic soldier is to be honored above all other men. But the woman who, whether from cowardice, from selfishness, from having a false and vacuous ideal, shirks her duty . . . earns the right to our contempt, just as the man who, from any motive, fears to do his duty in battle when the country calls him.

The following is significant for, be it remembered, President Roosevelt was talking to mothers, before a National Congress composed wholly of mothers. Evidently he holds the influence and opinion of mothers wide-reaching and valuable as touching those problems which parents usually feel quite justified in shifting upon the shoulders of someone else—the problems of education. Many of the sentences have a Theosophical touch that is illuminating, for after all, as George Eliot used to say, "What are we here for if not to make life less difficult for each other?"

I want to ask your assistance for two or three matters that are not immediately connected with the life in the family itself, but that are of vital consequence to the children. In the first place, in the schools see that the school work is made as practical as possible. For the boys I want to see training provided that shall train them toward and not away from their life work; that will train them toward the farm or the shop, not away from it.

*With the girl, see that it is not made a matter of mirth that the girl who goes to college comes out unprepared to do any of the ordinary duties of womanhood. See, in other words, that with the higher education which she should have—for she should have a right to just as much education, to just as high an education, as any man—see that with that goes the education that will fit her to do her fundamental work in the world.*

You cannot have good citizens, good men and women of the next generation, if the boys and girls

Lomaland Photo. and Engraving Dept.

#### A JAPANESE FLOWER SELLER ON HER WAY TO THE FLOWER MARKET

are worked in factories to the stunting of their moral, mental, and physical growth. Wherever the national government can reach it should do away with the evils of child labor, and I trust this will be done, but much must be done by the actions of the several State Legislatures, and do, each of you, in your several States all that you can to secure the enactment, and then the enforcement, of laws that shall put a stop to the employment of children of tender age in doing what only grown people should do.

Do not forget that love is what the family is based on, but don't do children . . . the dreadful injustice—through a love that is merely one form of weakness—of failing to make the child . . . behave himself. A marriage should be a partnership where each of the two parties has his or her rights, where each should be more careful to do his or her duty than to exact duty from the other partner, but where each must, in justice to the other partner no less than to himself or herself, exact the performance of duty by that other partner.

STUDENT

#### Jottings and Doings

(From a Student's Note Book)

AN American woman now resident in Paris has just finished an exact copy in clay, made to scale, of the Sphinx, the plaster of which has been presented to the Field Columbian Museum of Chicago by a wealthy traveler and explorer. The copy is ten feet long and three feet high and is exact in every detail, Mrs. Longworth, the sculptress who made it, having spent many months at the task, climbing all over the huge original to make the measurements personally. It is said that she is the only woman who has ever been actually upon the very head of the Sphinx.

An unintentionally humorous touch is given to the cabled account of this, published in a New York paper, by the naïve use made of the word "replica," the reporter evidently being unaware that no copy can be a replica unless made by the one who made the original. Would he have us infer by his bold caption, "Replica of the Sphinx," that the thousand toilers and co-architects and the mighty Builder himself have reincarnated at one and the same time in the person of this young American woman? One can hardly think so.

QUEEN AMELIE of Portugal, who is a physician as well as queen and whose work in the hospitals of Lisbon has made her famous far beyond the confines of her own land, was recently walking in a wood upon her estate when she heard a cry. Hastening in the direction indicated she found one of the woodcutters of the vicinity in great suffering from a broken limb. He had been cutting wood when a heavy branch fell upon him. The Queen immediately gave him first aid, then assisted him to his cabin where she gave his limb the proper surgical attention. The next day she called to see him and the poor man was so overwhelmed by these kindnesses, as writes a correspondent, that he could only stammer, "I shall never be able to repay Your Majesty, but when I am about again I shall bring you a basket of fresh eggs and butter"—and true to his word he did.

THE newspapers are commenting upon the case of a woman who last year harvested eight thousand bushels of wheat and three thousand bushels of corn from her Kansas farm, of course with the assistance of helpers of whom she employs twelve the year round, with additional "hands" at harvest time. Twelve years ago her husband died and left this woman with a family of little children and a mortgaged piece of land. Today her farm, now grown to many times its original size, is free of debt, and one of the best properties in the State. Its owner declares that if women will use their brains they will not have to work nearly so hard and that results will be a thousand times more satisfactory, a most Theosophical conclusion, surely.

A similar case is that of a woman who is now known as one of the largest owners of cattle in Texas. Ten years ago her husband was killed in a "round-up" of cattle, and she was left absolutely penniless with a little babe dependent upon her. She owes success to a habit of self-reliance, of "thinking things out for herself," a Theosophical quality as well.

# OUR YOUNG FOLK

## Finland

"OH land, thou land of the thousand lakes," sings Finland's great poet Runeberg. Yes, Finland is a land of lakes and streams, murmuring pinewoods, songs and sagas! It is the land of the old Kalevala songs; it is Väinämöinen's land, where he sits by the stream and sings of the creation of the world, of gnomes and sprites, fairies and trolls; wonderful, magic songs!

In Finland the Frost-giants rule two-thirds of the year. Before the crops are ripe sometimes winter comes; but the Finns are a hardy people, able to stand cold and hard labor. They love their country devotedly. Oppression but stirs in the Finns a more intense feeling of nationality. They have struggled bravely for their rights, for their laws, for their dear old language; and their struggles have not been in vain for today they have all these.

The national costume is worn on many occasions during the summer months. When the hay is mown the Finns have hay-bees, and when the day's work is done the young people dressed in the Finnish costume gather in the spacious kitchens and dance their national dances and sing their national songs. On festive occasions they also recite some of their beloved poems.

Many are the evidences in Finland of an intense patriotism. The first of May when the students have their graduation exercises in the towns, and the twenty-fourth of June, Midsummer's Day, are special occasions when the Finnish national costume is donned.

## A Monument to the Martyrs of the "Virginus"

IN 1873, during the Ten Years' War in Cuba, occurred the incident of the *Virginus*, a ship sailing under the American flag. It was seized near Jamaica by the Spaniards, who acted on the ground that the *Virginus* had on board men and arms to be landed in Cuba for the purpose of reinforcing the Cubans. The *Virginus* was taken to Santiago, arriving on the first day of November, and before a week had passed fifty-three of the men who had been on board, among them both Americans and British, were hurried through a mere semblance of a trial and shot. The American consul at Santiago demanded in vain to be permitted to see the prisoners and to protect any that belonged to his country. The Spanish authorities carried things with a high hand and refused to allow anyone to interfere.

Not until England sent a ship, the *Niobe*, under the command of Sir Lambton Lorraine, who threatened to bombard Santiago if the massacre were continued, did the shooting of the prisoners cease. In December after tedious negotiations, the *Virginus* was handed over by the Spaniards at Bahia Honda, and the surviving prisoners were surrendered. A large sum was paid by Spain as an indemnity to the families of the American and British

## AN ANCIENT FINNISH COSTUME

### TO MY DAUGHTER

Bayard Taylor

LEARN to live and live to learn,  
Ignorance like a fire doth burn,  
Little tasks make large return.

In thy labors patient be,  
Afterward released and free  
Nature will be bright to thee.

Toil when willing, growth less;  
"Always play" may seem to bless,  
Yet the end is weariness.

Live to learn and learn to live,  
Only this content can give,  
Reckless joys are fugitive.

prisoners who had perished by the massacre.

A movement is on foot to build a monument to those who thus lost their lives, apropos of which we append the following translation of a letter received by the Directress of the Rāja Yoga Academy in Santiago.

STUDENT

Santiago de Cuba  
March 19, 1908

Miss Nan Herbert,  
Directress, Rāja Yoga Academy  
City.

Dear Miss Herbert:

I have the honor to acknowledge the receipt of check—sent with your letter of yesterday—as a subscription from the children and teachers of the Rāja Yoga Academy and Free School to the fund for the erection of a monument to the Martyrs of the *Virginus*.

In the name of the Commission I accept with the greatest gratitude this gift from that Institution, founded in love and universal brotherhood. And it gives me pleasure to express to you the inner satisfaction that I personally feel at the examples of compassion and patriotism that the Cuban children

receive in the Academy under your meritorious instruction.

Respectfully yours,

FEDERICO PÉREZ

## Two Daring Nature Lovers

THE Brothers Kearton, the pioneers of nature-photography in Great Britain, belong to that increasingly large number of men who go into the woods, or follow the mountain brooks with camera and tripod instead of with gun and fishing-rod. They pursue their calling with all the courage and the ardor that old-time sportmen gave to the chase, with so much more praiseworthy and beneficent results.

Nor have their experiences been the less thrilling for their humane character. More than once they have risked life and limb, hanging suspended over a precipice, camera in hand in order to capture upon a sensitive plate a wild bird on its nest which was built in an almost inaccessible cranny of a cliff.

One of the brothers once stood up to his neck in water, six hours a day for three days, holding a camera on stilts in order to snapshot an osprey in its natural habitat. They also build tiny huts of grasses or stones, resembling the surroundings of a given location, and in these lie in wait for days for the shy wild creatures whom they wish to photograph in their natural haunts. They have even been known to make artificial animals, and to conceal themselves in these with camera pointed through a tiny aperture in side or chest of their unique "stalking-horse." Indeed the patience, skill, and ingenuity of these nature-lovers are limitless.

One of the brothers not long ago secured a photograph of a male bird of one species feeding the parentless nestlings of an entirely different sort, and he cites this in support of his belief that if we study animals closely enough they will supply us with better stories than we can fancy about them.

However this may be, these two brothers by their books and their pictures, evincing a sympathetic love of nature, have earned our gratitude.

STUDENT

## A Fact Worth Knowing

PAPER was unknown to the people who lived in the forests around the North Sea when the Roman Empire was flourishing. They formed their Rune letters, each of which was a magical sign, by laying together bits of the twigs of trees, or engraved the characters thus formed on stone or cut them in wood. One of the ancient Danish kings had a runic writing thirty yards long, cut on a rock. Many pieces of inscribed wood or runic sticks have been preserved. The laws also were inscribed upon wood in the runic signs and they were so lengthy that they sometimes covered whole beams. Hence in some parts of northern Europe today the books containing the laws are still called Balken, or beams; thus recalling the ancient usage. T.

# THE CHILDREN'S HOUR

## THE ROBIN

Celia Thaxter

IN the tall elm tree sat the Robin bright,  
Through the rainy April day,  
And he caroled clear with a pure delight,  
In the face of the sky so gray,  
And the silver rain through the blossoms  
dropped,  
And fell on the robin's coat,  
And his brave red breast, but he never  
stopped  
Piping his cheerful note;

For O, the fields were green and glad,  
And the blissful life that stirred  
In the earth's wide breast was full and warm  
In the heart of the little bird.  
The rain-cloud lifted, the sunset light  
Streamed wide over valley and hill,  
As the plains of heaven the land grew bright  
And the warm south wind was still.

Then loud and clear called the happy bird,  
And rapturously he sang,  
Till wood and meadow and river side  
With jubilant echoes rang,  
But the sun dropped down in the quiet west,  
And he hushed his song at last;  
All nature softly sank to rest,  
And the April day had passed.—*Selected*

## INDUSTRIOUS ANT-COMRADES

### An Ant's Story

DEAR CHILDREN: I am sure you do not recognize us as the little creatures called "ants" which you see busy about our little sand-hill homes in your garden path. It is because we have had our pictures taken through a magnifying glass which makes us look much larger than we really are, so that you may see how we do look.

Our real name is EMMET, but our common name is ANT, and now since we are introduced to you I will tell you just how we live.

When we first start out, we are tiny white oval eggs, often tucked into a little silky cocoon which our mother, when she has taken off her pretty wings and made ready for house-keeping, lays in a small hole in the ground or under a bit of old wood.

Our mother takes all the care of us when in about two weeks we hatch out into little white grubs or worms, but when in about two weeks more we grow into ants, then it is our duty to help our mother by taking care of the eggs and the little new grubs as they hatch.

These little grubs are quite as helpless and seem to need as much care as any little human baby. We are most particular to see that they have a warm place in which to lie, and that they are properly fed, washed and combed; and when they get large enough to hatch into ants, we help them to unfold their little new legs and spread out their wings; for many of our little brothers and sisters start out with wings.

Then we worker ants must go forth and find the food for the family—some to gather in the grain and bits of seeds from the grass which must be husked and stored up for the winter, and some to milk the cows; for we ants are friendly with a little insect which

lives on plants, called APHID, and which when stroked by the ant's antennae will squeeze out from two little tubes on its back a sweet liquid called "honey-dew," which the ants use as food.

Now my friend on the extreme left of the picture has been out to milk the cows, and has enough honey-dew in her little body to feed many of us for a long time. She with others whose duty it is to provide the honey for the rest, will fill their bodies full and then will hang themselves from the roof of one of our caverns in our underground nest until the food is needed. There they will hang, hundreds of them, if our family is a large one, all over the roof like so many molasses barrels, ready for next winter.

Our underground homes extend under a good deal of ground, for they are made up of long passages, with here and there chambers hollowed out for our grain supply or our honey barrels, or for places for the eggs and baby ants and ourselves to sleep at night and in the winter. We keep our homes in good order, for we are very particular about cleanliness, and especially about our own toilets. We never go to sleep without bathing ourselves and combing our hair, which grows all over our bodies. We use our tongues to wash with, just as your pussy does; and for combs—we have these too—we use a part of our legs. Sometimes we brush and comb each other, for we ants believe in helping and sharing, I assure you.

We are very strong, much stronger than you are in proportion to your size. You could not carry a log of wood or a sack of grain for a mile or so in your teeth, but we can carry a grain of wheat which is twice as large as we are and very much heavier.

We ants of one community have naught to do with another community. But we carry on the business of our own community in a model way, all working for the common good and always ready to sacrifice even our very lives for the good of all.

EMMET

### How The Rose Came

HAVE you ever heard the beautiful story of how the first roses came into the world? The legend is told that long ago a beautiful maiden, who was as good as she was fair, was accused of wrong-doing by some unjust people, and they were about to burn her to death in punishment. Knowing in her heart that she was innocent the maiden knelt down as the flames began to leap about her, and prayed fervently that some sign might be given to convince them of her innocence. Soon the flames around her died down and the fire went out. Then a wonderful thing happened. The people saw the wood which had been burning a moment before suddenly changed into great branches of red roses, filling the air with fragrance, and pieces which had not yet kindled became all abloom with lovely white roses. The innocence of the maiden was proven and her life saved by the miracle of the roses; and thus it was—so says the legend—that the "queen of flowers" was born.

ALICIA

THERE are miles—and miles. In Switzerland, Hungary, Poland, and Denmark, the miles are all longer than American miles. In Sweden a mile is more than six times as long as one in America. China has a short mile of 629 yards. Thirty-seven kinds there are altogether, and the longest is eighteen times as long as the shortest.

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis  
Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

### Springs of Thought in Japan

THE remarkable developments and changes in Japan which have taken place within barely half a century have been attributed by certain complacent western writers to the influence of Christian civilization. Other writers, however, with more insight, have sought the origin where it necessarily should be sought—in the forces at work and inherent in Japan. For it is in the inner life, in the thoughts and ideals of the Japanese themselves that the real causes of Japan's great outer development must be found. The schools of thought and ethics which have been most influential are dealt with by Dr. Inoue in his voluminous work. This latter, however, has not yet been translated into English, though Mr. G. M. Fisher and others have done good work in bringing portions of this valuable information before the notice of those unable to read in Japanese.

The latest school thus dealt with is called in Japan the Yo-mei school and owes its name to the founder O-yo-mei (in Chinese, Wang-Yang-Ming, 1472–1528, a contemporary of Copernicus). This one of the three great schools of Chinese thought and ethics in Japan was introduced by Nakae Toju, the Sage of Omi (born just 300 years ago, in 1608, the same year as Milton).

The influence of the Sage of Omi can hardly be overestimated. In fact it is the opinion of most Japanese that it was the work and life of this great man that led to the Restoration and to the present new era in Japan. All of the Japanese elder statesmen and leaders—Saigo Takamori, Yamagata, Oyama, Ito, Admiral Togo—in fact all of the principal men of and before the Restoration of the Imperial power have been students of this school. It is evident, therefore, that all who wish to understand the hidden springs of Japan's great progress should study carefully the teachings of this school.

A few of these teachings according to the Sage of Omi will indicate the general nature of the doctrine put forth. He conceives an infinite and omnipresent spiritual nature called Jo-tei. "The soul of Jo-tei is the pervading I; the soul in us is the limited I."

"Man is god in miniature; god is man magnified."

"The heaven (or goodness) in us is our heart or conscience."

"Heaven, earth, and man are called the three ultimates. They differ in form; the divinity in them is the same."

"Ryo-chi, literally 'good or divine wisdom,' is within us. If we act according to Ryo-chi's commands our actions are all good; if we violate Ryo-chi our actions are all bad. Ryo-chi is good; if we follow Ryo-chi good is constantly lord of our hearts."

Hence the distinction between the superior man and the inferior man depends on the degree to which a man opens his nature to the guidance of Ryo-chi.

Finding God manifested in man's conscience, the Sage of Omi believed in the possibility of perfect communion and self-identification with the universal spirit through self-culture and self-control.

#### Brotherhood a Fact in Nature

"Since all creation is from the same great root, all the men within the four seas are connected branches. If we look upon Heaven and Earth as the parents of all men, then we and other men, whosoever bears the human form, are all brothers. To set up a barrier between ourselves and others and to look upon them with aversion and contempt is the sign of a mean misguided heart."

The Sage of Omi (Nakae Toju) died in 1648 at the age of 40. He was an ardent advocate of woman's education and devoted six volumes to the subject. His memory is held in high reverence throughout Japan.

These facts should be well considered. All the principal sects of Christianity have been given a fair hearing by the Japanese. Onslaughts on Japanese ideals and beliefs have been patiently, tolerantly borne. The message of the Christian churches has been heard, well weighed and compared—and declined.

For Japan has not been without light, and this light and that elsewhere is one. When the real light is offered it will be recognized; and those who bring the light will also recognize.

#### A STUDENT IN JAPAN

### National Gentlemanhood

DOES the American propose to be a mere thinking higher animal because remaining under the laws that govern animal life; or does he propose to become a full man?—is a question practically asked by two professors writing independently in the March *Popular Science Monthly*. They attack our ideals of national life as reflected in our ideals of education.

Within the last few years we have frequently heard the exultant statement that the United States is now a World-power. What is a world-power?

Is it a nation whose armaments are able to wring from all rivals their choicest possessions, their consent to unlimited aggression? Is it to build the biggest and most battleships? From the depths of my soul I believe not. What matters it to history how many thousand tons of steel or bales of cotton or bushels of wheat we export to Europe? Is not the question this: How many *ideas* do we export, and is our product commensurate with our material greatness? What care we that Sparta was victorious in the Peloponnesian wars, if she has left to our civilization no reminder of herself, while the ideas produced by Athens will keep her remembered when both her temples and our skyscrapers shall have crumbled into dust?

This quotation represents the keynote of one article. Our educational establishments do not stimulate the higher, creative, originative, independently researching activities of mind; they only impart knowledge, and only such knowledge as will afterwards have a cash value. This is the essence of the indictment, illustrated in part by an anecdote:

A friend of mine, a distinguished professor of mathematics in the University of Paris, has as his regular duties the delivery of two lectures a week for one semester, that is, during four or five months of the year. The rest of his time is his for research. The result is that he is one of the two or three of the world's greatest mathematicians. For the amount of work that I have mentioned he receives what until last year was a full professor's salary at Harvard, the largest, with two exceptions, of any in the United States.

The other paper is on adaptation to environment, and begins very scientifically. All the animals have to adapt themselves to the environment they find, or perish. The chief of the environments is food, a limited quantity. Therefore every animal must sharpen every faculty and power in order to get, adapt himself to, that.

We have selected, unnecessarily, a *cash* environment as the one to which we will adapt ourselves. The second writer says:

It is not to be forgotten that the survival of the fittest is always relative to the conditions demanding adaptation, and, whilst animals have no preference, man may exercise a choice as to the conditions to which he will adapt himself, and this is broadly the distinctively human quality. . . . *Now society may fail to choose for itself the highest goal, which is nothing but failure to select the largest environment to which to adapt itself.* It has choice of various inferior lines of growth. Then "practical" education will aim to fit the individual for the most perfect adaptation to the inferior plane chosen. *Man has largely inherited the animal method and only partly chosen the human.*

We have, as it were, selected the *cash* plane of nature to which to adapt ourselves. If our educational establishments seem, for example, to be teaching literature, it is cash which is mostly in view, not the thing learned or taught. Says the first writer:

I well remember my first impressions on arriving in Germany. After an experience of five years as student and instructor in Cambridge, where it was considered (among the students) good manners not to be warmly interested in anything in particular, the entrance into a community where everyone was tremendously interested in the piece of work upon which he was engaged, and was not ashamed to talk of it, . . . and where, after a morning in the laboratory, one would adjourn to a restaurant and talk shop all through dinner, this was to me a tonic like the effect of a cold bath.

Cash is the world to which we have elected to adapt ourselves: not the world of ideas, not the world whence inspiration in philosophy, poetry, science, and art, comes. There are brilliant exceptions, but they stand apart from the general current. And in adaptation to *that* nobler world many of the older countries are far ahead of us. Until we have altered our lesser ideals the greater and freer minds from the past touched by the lights of the higher world, will not incarnate in our midst; they will necessarily select an environment more fitting their culture. We can attract them; we can alter the situation as soon as we will; it is within our power, as the youngest nation, the universal heir, to lead the rest in humanity and elevation and beauty of culture: but we have not yet begun to do so. Hardly even do we follow. We have not yet even taken for our own the old high beautiful ideal of a *gentleman*. As a *people* we are not a gentleman, with the fine attributes of courtesy, freedom from vanity and ostentation, love of the beautiful in conduct.

### Filtering Out the Molecules

A PAPER on *Ultra-filtration: a Proof of the Existence of Molecules*, translated in the *Scientific American Supplement* from *Umschau*, brings out some interesting points.

Without at all disturbing the question as to the ultimate constitution of matter, we can consider a molecule as a particle of definite mass and size, being the smallest mass in which the properties of the compound inhere, any further division resulting in breaking up the molecule into its constituent atoms. The writer says that at one time milk appeared to be a homogeneous mixture; but now we can detect its oil globules with the microscope. What the microscope has done for milk, the ultra-microscope has done for those heterogeneous mixtures of much finer grain known as colloidal solutions. The smallest particles that can be distinguished with the microscope are about one 500th millimeter in diameter; but with the ultra-microscope in concentrated sunlight it is possible to detect particles of a diameter of one 200,000th millimeter. These dimensions are but little greater than those assigned on theoretical grounds to the largest molecules—for example, those of starch. With stronger illumination, such as light obtained on a tropical mountain, we could unquestionably see individual molecules.

The writer has experimented on the idea that it must be possible to filter out dissolved substances from their solutions. Filter paper removes turbidity; the pores of infusorial earth, burnt clay, and unglazed porcelain, being finer than those of paper, extract bacteria from water forced through them. The writer constructed filters with much finer pores by impregnating fabrics with gelatine. These filters were of graduated fineness, and the size of their pores could be determined by measuring with the ultra-microscope the size of the particles they filtered. Further, having devised a means of measuring the size of the pores independently of the ultra-microscope (namely from the pressure required to force air through them), he was able to separate from solution and determine the size of par-

ticles invisible in the ultra-microscope and smaller than the largest molecules. Thus he gets:

	DIAMETER
Human blood corpuscles	7,500
Bacillus of splenic fever	4000 to 15,000
Cocci, or spherical bacteria	500 to 1,000
Limit of microscope	250
Wave-length of red light	690
Albumen molecule	5 to 10
Limit of ultra-microscope	5
Pores of finest ultra-filters	1.5
Alcohol molecule	0.5

The figures represent millionths of a millimeter.

An interesting point is to be noted in connexion with what is quaintly called "Brown's motion." The minute particles revealed by the ultra-microscope are found to have the properties assigned to gaseous molecules by the kinetic theory of gases. In 1828 a botanist named Brown observed that very small lifeless particles in the field of the microscope have a peculiar vibrating motion, quite different from the movements of living microscopic organisms. A colloidal solution of gold, examined with the ultra-microscope, exhibits Brown's motions in an intensified degree; the minute particles of gold dart hither and thither, collide, and rebound. A certain degree of fineness is required for the production of these movements, and their velocity increases with the smallness of the particles.

Now many scientific minds, accustomed to think of matter as inherently motionless and inert, will consider this motion as something superimposed upon the particles, and will search for a force that imparts it. But why should they do so? However far back we may trace the cause of this motion, we shall never get any nearer to a conception of motion in itself. So why not say that motion is an inherent and inseparable attribute of matter? Thus "matter-in-motion" will be the physical unit or rudiment, while "matter" and "motion" will be abstractions.

### American and British Railway Accidents

THE *Scientific American* contrasts the casualties to employes on the American and British railways. The mileage of our lines is 200,000; the British 27,000. Our own railways carry about four-fifths of a billion passengers annually; the British about one billion and a quarter. "Now the carrying of a billion and a quarter passengers on 27,000 miles of road means a very much denser traffic than the carrying of 800,000,000 passengers on over 200,000 miles of railroad." Yet in the year 1906 there were only 239 collisions and derailments in Great Britain as against 13,455 here! And our lines killed 879 employes and injured 7483 as against only 13 and 140 there!

The journal attributes the extraordinary differences to "the inbred cautiousness of the [British] employes; to their natural inclination to remain many years in the same position, thereby acquiring thorough familiarity with the conditions; and lastly, and chiefly, to the excellence of the railroad discipline." American employes appear to be incautious, and to remain, on the whole, but a short time at the work. "Even more serious, as a predisposing cause of railway accidents, is the lamentable lack of discipline which is becoming increasingly manifest in these days of labor union interference. This has been carried to such a point, that the officials of our railroads have no longer that direct control of the employes which is absolutely essential to the maintenance of discipline."

# Some Views on XXth Century Problems

## The New Economy

IF we could look at humanity through some kind of instrument which gave us consciousness instead of matter, the readjustment of focus would give us some interesting pictures.

Before we began to turn the screw we should see men in their individuality, each in his little personal sphere of hopes, thoughts, aims and fears.

With the first turn the units would fuse into great masses and after a little study we should see that these masses were nations.

There is a French, a German, a Swiss consciousness belonging to the nation as a whole, and within which each unit has his private being.

But other turns would give us other pictures, other fusions, other groupings. We might see men grouped in their occupations, doctors, lawyers, preachers, journalists. French and German doctors, as such, are not Frenchmen and Germans; they belong to the group "doctor" and as such have a common mental color and pre-occupation.

There are groupings of scientists, archaeologists, biologists and what not. In fact with every turn of our screw the picture would change and new groupings come into view. When for example a Peace Society with membership in all nations gathers to attend a congress at Paris or Zürich, we have one of these ideal groups made visible to the outer eye.

Our instrument is one that looks into the world of thought and sees the innumerable thought-centers of the great thinker humanity.

But so far, men are more conscious of their separate individualities than of their co-membership in the many groups to several of which we all belong.

Further human progress lies in reversing that proportion.

The groups are quite real; there is a real sharing of consciousness, to some small extent, among all the members of any group. Because of that fact, a great scientific idea, for example, will occur to more than one thinker at once, sometimes more or less vaguely to several. Because of that, there are wide waves of fashion in religion, science, politics, and so on. No one thinks as a member of a group, as for instance as a German, an archaeologist, a peace-lover, without in some degree touching with his thought all the other real members of his group. No musician composes without slightly helping the inspiration of all the rest.

But this process, by which each gets some benefit from the mental or spiritual efforts of every other in the same group, without losing any of the benefits of his own efforts, is held at an extreme minimum by selfishness, by the careful walling-in of each individual by himself, by his concentration on his own interests, by non-recognition of himself as one of a group, as a member of several congresses in permanent session in the world of thought.

As soon as this ignorant and mistaken limit-

ation disappears, human progress will go at a tenfold pace. The final condition of the individual's swift progress in the now unimaginable use of his still almost latent powers is that he shall constantly and predominantly feel his comradeship with all humanity, with all his nation, with all of the several groups into which he passes as he passes from one activity to another. As he thinks and works he must feel the tide of corresponding human thought flowing through and about him. He need not fear to lose his individuality; he cannot do that. Each of us is something unique in the universe; it cannot do without him in especial, the special thing and work and power which he alone can contribute. But he cannot contribute it whilst he selfishly spheres himself off in thought from the rest; he can hardly begin to get at his own powers. Great powers do not grow under a hat and umbrella and inside a coat; they need the generous open air of brotherly feeling. STUDENT

## The Block of Vivisection

THE vivisection controversy appears to be reaching an acute phase in New York.

A leading daily has lent itself to the crusade against the practice. Others are taking up the discussion, and a well-known weekly sneers in each issue at the "sentimentalists."

The vivisectionists may say and do as they please. The tide of prohibition is coming in. The mere expediency arguments, pro and con, are but corks dancing on the top of it. Public conscience is awakening in respect of this as of some other matters. It has perceived that the atmosphere of vivisection is a *black* one and suspects that any of its products must in the end work out as pure evil.

The vivisector becomes callous, of course. That is a matter in which himself and, if he is a doctor, his patients, are more specially concerned. The public, though they only intuitively know it, are concerned with the fact that he is a consciousness in their midst which is charged with pictures of torture and mutilation: energetically infective pictures, scattering and hypnotically suggestive in the minds of boys, of the already criminally inclined, of the mothers of unborn children. If such a consciousness could be photographed, the man would not be allowed inside the borders of a civilized country. If the public will put together what they can imagine must be the contents of such a consciousness, and what they now know of the powers of unspoken suggestion and thought-transference, they will partly understand the situation. They might also try to understand what the dying animal—in its way, immortal as we are—must be doing, learning by the first and only prolongedly horrible experience of its life to associate this with man for its cause, and dying in the culmination of it.

Knowledge, for example of cerebral localization, has been gotten by vivisection. It could have been gotten other ways. The getting of it in this way has delayed the advent

of finer methods upon which the physiology of the future will be founded. This science might almost be said to be in the middle ages: is fit only to be the laughing-stock of such reborn sciences as astronomy, chemistry, electricity.

Vivisection has provided us with some serums. In a few cases they have reduced the deathrate of appropriate diseases. But they only rob Peter to pay Paul. The death-rate of others has risen to fill the place. Society as a whole has profited nothing. It has indeed lost, for the enormous amount of energy spent in the search for serums was sidetracked from the truer path.

What is morally wrong, that which shocks the heart of man and therefore the greater heart of nature to which the former should be attuned, cannot in the end work out as practically useful or expedient. Men and women know that vivisection is morally wrong; let them refuse to be hoodwinked into the belief that it can be somehow made to yield good anywhere. M. R. C. S.

## Universal Symbols

PROFESSOR PFLEIDERER has shown that it is possible to be a Christian and yet recognize the vital connexions of Christianity with older creeds. In a series of lectures he delivered at the University of Berlin, just published in English, he says:

We must relinquish the notion of a unique revelation and of a single infallible revelation. . . . No longer is it narrowed to one little corner of the earth called Palestine, or to a time long since past, but in all lands and in all ages God has made himself known and has permitted pure souls to find Him when they sought Him with earnestness and reverence.

Examining the great historic faiths he shows that not only the legends but the lofty thought and aspiration which were once considered as peculiar to our own, are common to them all.

Surely we lose nothing when we find Christmas Day, Sunday, and Easter in the older creeds; when we find Adonis, Osiris, Mithras and others entombed for three days and coming forth at Easter; when, long before Christianity, Mithras was sacrificed for the purification of his worshipers and the world; when we learn that he carried a lamb on his shoulders, which was slain and eaten at Easter; that he was born in a cave—as, according to Justin Martyr and Origen, was Jesus—and on Christmas Day; that his disciples partook of a sacred cake, "Mizd," from which the word Mass is now said to be derived; and that the crucifixion was symbolized in many ancient cults. We should do better to try to find the meaning of these symbols than to grumble at their ancient prevalence or charge the Devil—as did three of the early Church Fathers—with having plagiarized Christianity in advance! For every one of them is a pictorialization of something in the life of the soul. The soul did not come into being with the arrival of Christianity. STUDENT

# Archaeology Palaeontology Ethnology

## Signs of the Times:—Rehabilitating the Ancients

LECTURING on "The Relation of Archaeology to Classical Studies," Professor Ridgeway, Professor of Archaeology and Reader in Classics at Cambridge, (England), said that the finding of case after case in which the statements of ancient writers were proven to be true altered our whole moral attitude towards history. It was quickly abolishing among the younger generation of scholars that pettifogging spirit of scepticism which thought that the only way in which a man of ability could show his scholarship was by declaring that a certain passage in this or that great writer was simply a false statement or a sheer invention.

And the chairman, Professor Phillimore, afterwards added that we were recovering painfully, but he would not say slowly—indeed rather rapidly—from an age which suffered from a positive mania for incredulity, when they had only to go about and find something to disbelieve, and they passed for men of science at once. The conclusions of archaeology were the conclusions of common sense. Just where pedantry in one line or another had deviated from common sense, just there archaeology had come to the rescue and put us straight again. Archaeology had now proved by positive demonstration what common sense had set out by believing—that *on the whole the ancient historian was probably to be trusted*; anyhow that the safe starting point was the credibility of history and the veracity of historians until the contrary had been proved.

The above is refreshing after a recent experience of reading the views of a professor on the dimensions of ancient Babylon, in which he sweeps aside all the unanimous testimony of classical historians and even that of modern archaeologists, and bases his theories solely on the results of some recent superficial diggings. It is refreshing after reading the school books with their stupid sneers and ludicrous pedantry, printed above their own footnotes announcing recent confirmations of ancient history such as those at Troy and at Knossos.

But it is not altogether a case of historian against archaeologist; archaeologists themselves have their weaknesses, nor are all historians tarred with the same brush. The case is one of freedom of the mind against mental subjection, whether in archaeologists or historians.

Conceit brings its own punishment by shutting up the mind against the entrance of breezy truths and causing the patient to believe what is unbelievable and disbelieve what is true.

The same lecturer also said that the chief value and attraction of classical studies was that they opened the minds of the ancients to us and got us out of our groove; but that pedants had to some extent discredited classics by making the study too verbal and pedantic. In the same way Shakespeare's works studied by one with no knowledge of the English life of those times, and with the aid of dry

Lomaland Photo. and Engraving Dept.

## REMAINS OF THE TEMPLE OF PALLAS-MINERVA, ROME

Showing how the ancient building has been built around, and included in modern dwellings

notes only, would be a dreary and profitless study.

Then let us study the Greek and Latin classics, but not confine ourselves to them. Why not study the literature of ancient Egypt and India—just to enlarge our minds by getting into another sphere? Why not drop Christian theology for a while and study Mithraism or Buddhism—just to get a side-light.

The rehabilitation of the ancients is one of the things which H. P. Blavatsky said would occur in this century.

STUDENT

## Proof of Man's Antiquity

ONE of the best proofs of the great antiquity of Man upon the earth, and of the fact that he has not been subject to any scheme of gradual "evolution" *within recent times* in the manner alleged by some anthropologists, is the circumstance that no change has taken place in him since the earliest ages wherein we find any trace of him. As a newspaper says:

"While there may be more or less change or variation, men are of practically the same stature and the same size of brain today as they were before the dawn of history. In prehistoric ages the size of the human brain increased enormously."

This last remark is of course conjecture, made to fit the hypothesis, as is also the further remark that "the increased bulk of brain ceased in early palaeo-

lithic times." It simply means that as man has not developed during times that are accessible, he must have done all the alleged developing before; and this developing has to be crowded into a short period on account of other geological necessities connected with the time-limits of the anthropoid apes. Thus anthropologists are slow to give up their theories, yielding only inch by inch in face of the facts. But Man was the contemporary of the very apes from which he is supposed to be descended, and of even earlier mammals. For his line of evolution is very different from that supposed by these anthropologists. The anthropoid apes do not form a link in the chain. The history of Man's origin as a physical being, of his spiritual heredity as a spiritual being, of the when and where of the union between the spiritual and the corporeal, are among the greatest mysteries of esoteric science; hints of which have, however, been given by H. P. Blavatsky and alluded to in these pages. It is enough to say here that Man, as a physical being, is very much older than the anthropologists will yet admit. There enter into Man's nature several distinct elements, of which the human animal is only one. Each of these has to be studied. Even those who talking of the "Descent of Man" see a twofold derivation, spiritual and material, do not take a complete view; for there is also an intermediate line of descent—the *Mānasic*. The efforts of science to unravel this complicated problem by original research are natural enough when we consider the necessity for a reaction against dogmatism; but they resemble the efforts

of a student who should undertake to build up anew by his own unaided efforts—say, the calculi in mathematics, or the system of astronomy. The idea that the world has never progressed so far in knowledge as it has at the present epoch will soon be generally regarded as untenable; and it will be understood that some ancient races possessed a really comprehensive knowledge of the history of mankind compared with which ours is small. STUDENT

## Ancient British Barrow

WINKLEBURY Camp, near Basingstoke, England, which has recently been sold, has, says the *Pall Mall Gazette*, a history as ancient as, if not indeed older than, Stonehenge. It was in existence at the Roman invasion and was occupied by them, but its origin "probably dates back to 1800 B.C." It must therefore, it is said, have been a camp of the ancient Britons. The termination "bury" means a barrow. One of the tumuli has been partially explored and has of course revealed the usual dust-heap remains which villagers and campers, of whatever age, always leave behind them, and which scientists examine in the hope of learning something about the builders of the original monuments. The remains were hailed to a museum, and the teeth and horns pronounced to be those of *Bos longifrons* or Celtic shorthorn (*sic*), belonging to the "later Neolithic period." T.

# ✻ The Trend of Twentieth Century Science ✻

## The Two Earths

THE earths of the geologists and the physicists seem to be two different beings.

The former require that beneath the crust shall be an intensely hot fluid, steadily radiating its heat and contracting. The contraction results in fractures and movements of the crust, constituting earthquakes; in extrusion of some of the contained fluid, constituting volcanos; and in the elevation and subsidence of mountain ranges and continents.

But the latter regard the planet as a solid, probably iron below the thin crust, and with the rigidity of steel or glass; nor need the iron core be hot, for the amount of radium in the crust will suffice to explain the heat of mine shafts.

The rigidity follows from the existence of tides. "If the whole of the earth were in a liquid state no tides would be observed, for the full extent of the surface exposed to attraction would rise and fall together." If the interior were merely viscous "the tides would exist, but would be much less pronounced than if the earth's interior were rigid." But the tides have their full value. "Hence Lord Kelvin concluded that the earth 'must be more rigid than steel, but, perhaps, not quite so rigid as glass.'" (J. J. Stewart, in *Knowledge*)

Earthquake waves travel in two sets. One travels straight through the core, the other curves round through the crust. The former, with a straight path, are the quicker. From the difference in rates the density of the core and the thickness of the crust can be calculated. The calculation gives about forty miles for the latter.

Some experiments on the force of gravity also show that whereas this varies according to the varying density in different places of the crust, the variations cease at a point about corresponding to the assumed thickness. Below that there is uniformity of density—often confused, by the way, with uniformity of structure.

The density of the earth as a whole is compatible with its being an iron planet of high density covered with a rocky film of low density.

This structureless iron earth must now explain how it generates its volcanos, its rises and falls of continents and mountains, and its ever varying magnetic and electric currents. The assumed structurelessness may presently look a little doubtful. STUDENT

## More Geological Difficulties

THE newly published investigations of Mr. Pearson, showing that some raised beach lines can be accounted for—and only accounted for—by the periodic flow of water from pole to pole in a cycle of about 20,000 years seem likely to excite one of the equally periodic flows of geological opinion. For, so far as these beaches are concerned, rises and falls of the crust are not required. The swing of opinion will be towards the contention that the crust does

not move at all throughout geological time.

The current, or Huttonian theory of mountain ranges rests on a belief in a contracting—because cooling—earth. As the contraction goes on, the crust slowly or suddenly "ruckles up" like the skin of a dried apple. The ruckles are mountain ranges. The theory is perhaps extended to the appearance of continents.

But supposing it satisfactory, it would not account for the disappearance of mountains and continents. One school of geologists are accordingly constrained to deny the disappearance of the latter, and are in some straits about the disappearance of the former. They may or may not be relieved by the Pearsonian theory, which requires no crust movements at all and even spurns them.

The contraction theory, at any rate, will doubtless go. One geologist finds that a cooling extending over some millions of years from a temperature of 7000° F., would produce ridges of no greater height than 6 or 7 feet! Lord Kelvin was also opposed to the contraction theory. Major Dutton says of it: "It is quantitatively insufficient and qualitatively inapplicable. It is an explanation which explains nothing which we want to explain." Mr. Pearson himself says that "crustal movements"—due to contraction—"sufficient to explain mountains of the slightest elevation, in any geologic age whatever, are impossible physically, and must be entirely repudiated by the geometers," by which he must surely mean geologists.

But the evidences of various kinds for the elevation and subsidence both of mountain ranges and continents will not indefinitely consent to be silenced by any wave of fashionable opinion. A contracting crust will not suffice for the subsidence of the former, nor for emergence or subsidence of the latter. We are evidently awaiting the discovery of new laws of earth life. STUDENT

## Problems in Biology

BIOLOGISTS seem to be facing a considerable difficulty. On the one hand it is certain that variations of a species continually selected by man and bred from, in order to produce and accentuate special qualities that he wants, disappear soon after he takes his hand away. The racehorse would not preserve his speed nor the brewer's dray horse his strength. Left to themselves both would gradually re-assume the average type.

But the variations among plants, produced by such workers as Burbank, are permanent. These men select the sort that has varied in the direction they want, and keep on doing so until they have all that they want. And once attained they say that there is no tendency to reversion.

Really however, the methods are entirely different; and the method of the plant workers could not be applied in the animal kingdom except at any rate on its lowest levels.

The plant worker cross-pollinates species removed by some considerable distance from

each other. The result is a sort of shock to the conservative *status quo*. It forgets its fixed traditions of form and the offspring are not so much variations of the old species as entirely new ones, relatively permanent as species always are. These, de Vries calls *mutations* to mark their distinction of origin. He seems to hold that new species never arise by the currently accepted method—the slow departure, generation after generation, by imperceptible degrees, from the old type until at last a new one is reached; but always by definite small or large jumps never receded from. The cross pollination method merely makes these jumps very large.

But this account is not a full solution of the difficulty. Certain of the Burbank products are fusions of desirable qualities. A good quality possessed by an otherwise poor species of wheat, for example, is, by cross-breeding, added to an otherwise good wheat which lacks that particular quality. According to the law of Mendel, thus blended qualities tend to sort themselves out again in subsequent generations. According to Burbank and such workers they do not. Further work is required to adjust the difficulty. C.

## Man and Guinea-Pig

AS has often been pointed out, the results of vivisectional experiments upon animals often led straight to mischief when they are applied to man.

Some French experimenters have recently been trying to determine the proper diet for tuberculosis. Should the patient have much or little nitrogen? Sixty guinea-pigs were accordingly injected with tubercle and then divided into three groups. To the ordinary diet of the first was added 9 grammes of butter; to that of the second 20 grammes of sugar; to that of the third 20 grammes of gluten—these three items representing equal heat-producing values. The last of the first group lived 40 days; of the second, 87 days; of the third 371 days. *Therefore* nitrogenous foods should enter largely into the diet of tuberculous man.

But this happens to be directly contrary to the carefully worked out experience of a special hospital in New York. It was found there that an accentuatedly nitrogenous diet, even corrected by the steady use of an eliminative—castor oil—often produced disastrous result. The excess nitrogen was actively poisonous and even led to death from varieties of rheumatism and gout. A low nitrogen diet with fresh vegetable juice and a special combination of various fats, was finally found to yield the best result. Who but a vivisectionist would have ever supposed that a dietetic experiment carried out on guinea pigs could teach us about the proper diet for consumptive man? One a vegetarian since its first appearance, the other a mixed eater for ages (in the West); one artificially inoculated with a disease otherwise unknown to it, the other the victim of the commonest of the chronic maladies of civilized life! ## Forestry Notes

**T**HE Loquillo Forest is about 66,000 acres, situated in the northeastern part of PUERTO RICO. A Forest Service commissioner has gone from New York to outline a plan for its management. It was created a national forest in 1903, but provisions were not made for its administration. It will be put under the jurisdiction of the Department of Agriculture, but with native rangers.

COLOMBIA has already outlined a forest policy and the ARGENTINE REPUBLIC has taken up the discussion of how to manage its own rich hardwood areas. Most of the South American States have large areas of forested land, but they have not been much used for lumber. Since, however, wasteful exploitation is now beginning, the people are waking up to the necessity for protection. An article in *La Nacion*, translated by the *Buenos Aires Herald*, says:

It is not only in the Province of Buenos Aires that the ancient tree plantations are being destroyed; the evil has spread to the remotest inhabited corners of the Republic. In a recent journey to and through the Provinces of the interior, I have found on every hand the effects of the savagely reckless felling of timber and the censurable carelessness of the authorities who allow it. The destruction is general, the finest specimens of our indigenous trees have been ruthlessly sacrificed; not only those of spontaneous growth but also those planted by our ancestors on behalf of their posterity. . . .

In La Rioja this senseless war against nature has laid low large plantations of magnificent and highly productive orange trees, the fruit of which is vastly superior to the importation from Paraguay here consumed. Had these trees been properly cultivated, the Province would now possess a source of wealth which would have spared it the shame of going a-begging from the National Budget.

In Mendoza the olive trees, cultivated as far back as two hundred years ago by the Jesuits, have completely disappeared. There, however, . . . are men . . . who are busied with plantations that promise to make good the loss. In San Juan the felling has been stupidly prodigal, with the result that not even half of the plantations remain which thirty years ago tempered its torrid climate and beautified its valleys.

In Santiago del Estero, Salta, Catamarca, and Jujuy, there are signs of the same barbaric destruction which, unless it is arrested, will soon leave those provinces as bare as a maize field that has been ravaged by the locusts.

As for Tucuman, the Tucuman of poetic legends mentioned by Avellaneda, it is today almost unrecogniz-

WILBERFORCE'S OAK, BROMLEY, KENT, ENGLAND  
Where Wilberforce planned the Anti-Slavery Bill

able. It would no longer be true to repeat his words where he says: "The orange and lemon tree which produce in rich abundance flowers and fruit, perfuming the ambient air, feeding the inhabitants and affording them a house and a home, are most beloved by them as the emblem of the felicitous union of the useful and the beautiful." No; even the famous and magnificent orange trees of the city plaza have disappeared to make way for more pretentious plants that unfit for the climate and inappropriate for the spot, cut the feeble and sorry figure of weazened and sapless consumptives.

The enormous lumber resources of the Ar-

gentine are practically untouched, and now is the time to save them by wise Government action.

In "Nature Studies," in No. 18 of this volume there was a note on the saving of the LANDES in SOUTHERN FRANCE by afforestation, with a picture of the dunes and pine trees. The Consul there reports to Washington glowing accounts of what this work has done for the region. Before 1803 the Department of the Landes, with an area of over 2,250,000 acres, was little more than dunes and pestilential marshes; but now it is one of the richest and healthiest areas in France. All this has been done by the planting of pines, which have not only banished the marshes and dunes, but furnish timber, charcoal, turpentine, rosin, vinegar, and many other things. The climate has become mild and balmy, and the clay subsoil, pierced by the roots, now thoroughly drains the land. STUDENT

## Siberian Wood for Australia

**T**HE increasing difficulty of getting wood is illustrated by the fact that an Australian corporation has received a concession from the Russian Government to take out thirty million feet of timber a year from a forest in Siberia 900 miles from Vladivostock. It is to be delivered in Melbourne, nearly 8000 miles away.

Thus the more inaccessible forests of the world are now being drawn upon. The entire year's cut will have to be shipped in July, August, September, and October, because in other months the ports are ice-bound. There is no duty on unmanufactured wood in Australia, but the duty on lumber is nearly \$5.00 a thousand board feet.

One wonders what the future archaeologist will infer about the human races of our times when he finds Siberian wood in Australia. H.

## A Sinking Lake

**L**AKE Tahoe in the Sierras, on the borders of California and Nevada, near Reno, Nevada, has recently been falling rapidly. The water dropped six feet in four weeks. Two years ago the water rose so rapidly that the surrounding towns were threatened. The lake is very deep, and may be situated in an extinct volcano. There is a legend among the Washoe Indians that the waters were once hurled out of the lake by subterranean forces and overwhelmed the inhabitants of towns in the valley which lies to the eastward. ## LIFE

Frances A. Kemble

**A** SACRED burden is this life ye bear.  
Look on it, lift it, bear it solemnly;  
Stand up and walk beneath it steadfastly;  
Fail not for sorrow, falter not for sin;  
But onward, upward, till the goal ye win.

*The Power of Right*

**W**E are not usually accustomed to look on the virtues as *forces*. And yet, as Theosophy teaches, they *are* so, and very powerful ones, the weapons of warfare with which we must maintain the great battle, and shall finally obtain victory. To the student of Theosophy life is not purposeless, but part of a great plan leading to final perfection for man, and with a constant trend upward for the whole of creation. During the period of man's probation, so to say, there is a constant conflict raging between the forces of good and evil for supremacy. Within man's own nature lie the keys which unlock for him the pent up forces of either side, and are embodied in his *attitude of mind*, with the inevitable result as shown in his *line of action*.

To be a successful combatant in the "Battle of the Ages," we need to keep our weapons bright and keen, and fight in strict accordance with the rules of the game, for as truly said by a great Teacher, it is warfare in which "no quarter is given, or taken," it is a "fight to the death," or shall we say rather, the life, *true life*. In Theosophy it shows that we have a place of great privilege and responsibility, so much of weal or woe depending on our action, and at the same time such perfect justice reigns that both responsibility and privilege are tempered by the degree of our knowledge, and the more a man knows, the more binding upon him is the practical exercise of the virtues.

In Theosophy, too, Humanity is considered as a *whole*. All the units are parts, as individuals, of the World Soul, and thus united in a spiritual life, so that Brotherhood is an *actual fact*, even if we act contrary to it and as if it were not. Moral law is inherent in Spiritual Nature, for justice rules; could a world maintain its balance otherwise?

Right is right, and wrong is wrong, the world over, even though they be relative terms governed by the degree of our intelligence. "To whom much is given from him much is expected." We have the parable of the talents as example. Now Theosophy brings a great hope to us in the knowledge that *right* has a power, a great force with it, an irresistible force for progress. It belongs to the side of our immortal nature, it is an activity of the soul, and behind it lie the vast stores of wisdom. When we make a stand for right we ally ourselves with the most powerful forces in nature; we link arms with all the heroes of the past, the patriots, seers, and Saviors,

and draw nearer to the true life. Theosophy teaches us that when one makes a stand for right, we *never stand alone*, it is a step nearer to a conscious knowledge of our divinity. It is the prerogative of divinity to dare to do right in the face of any odds, and wrong can make no headway against it.

We fail to stand because we fear. We say we shall lose our possessions, our friends, our life. Do we then place these things as more precious to us than our honor, our moral worth—our mortal life more valuable than immortality? We do when we back down before wrong; and who can count the price we have paid in the loss of the knowledge of Reincarnation!

We cannot grasp the real significance of "The Power of Right" when we take one miserable little section of our life to be the whole. No, the one earth-life is out of count in any rational philosophy of life, religious or otherwise; and that is what many thousands are now discovering to whom Theosophy comes as the enlightener. There is *no break in the continuity of effort*. Do we die at our post, we have but lost a body, and in a new form we take up our march towards perfection, helped or hindered by the character we ourselves have made by standing, or failing to stand, for the right. Right action lifts us above the troubles we suffer through vacillation, fear, doubt, or other weaknesses, and it steadily brings us into the place of helpers, instead of helpless.

We have much to thank H. P. Blavatsky and William Q. Judge for, not the least for bringing this glorious truth of the power of right before us, through the splendid foundation work of their unselfish heroic lives now made so manifest by the work of their successor Katherine Tingley. Soon, surely very soon, the waiting world will see, through Theosophy practically applied, the power of right. Truth is mighty and will prevail! E. I. W.

*The Quest*

**T**HE soul's long journey towards the goal, the ideal, has, since time immemorial, been symbolized as the going forth of a knight in search of that treasure most precious of all things on earth. To us the legend best known is that of the Quest of the Knights of the Round Table for the Holy Grail, the sacred Cup which was of itself but a symbol of the Christos, the Pure Light, the Jewel in the Lotus, the real "I." But the tendency has been to forget that all these legends of the Quest are but pictures which symbolize and mirror the *inner* search and travail, the inner conquest and achievement. King Arthur may or may not have existed. To the true student that matters not for he stands as type and picture of a Great Teacher—of whom the world has known many—sending forth his students, who were Knights and Warriors, on this Quest for the Holy Grail, the sacred chalice which none but the pure in heart could ever hope to find.

Little by little, we, as a race, are emerging from the dark age of literal interpretation of these great truths and are entering Sunlight by which we can read them with the eyes of the spirit. We are at last beginning to realize that the Quest is not an outer journey but an inner pilgrimage and battle. Not

less real are the foes we meet because they are unseen. They are more real, more terrible; but more real and more infinite than all physical warrior strength is the Soul-strength with which we may conquer them if we will. And what is the goal, the height upon which we may rest, the reward the Sacred Cup? Truly to find it is to find the Self; to conquer the foes that hedge in the path on either side is to unbar the Golden Portals which remain forever closed to the knocking of the hypocrite, the demands of the selfish, the petitions of the cowardly and the weak. The purity without which the real Quest will forever end in failure, is not that of the passive saint but of the active aggressive Spiritual Warrior. The Quest leads through dark ways and the valley which lies in shadow, but always may be seen the glowing Grail by those who look up, and upon the mountain whose summits enshrine the Chalice there shines the Eternal Sun. G. K.

*The Earth, Man's Home*

**T**HE older we know the world to be, the more clearly we see it as the home of man, owing its existence to his necessity, serving him as a sphere in which he may deepen his consciousness; the deeper our interest in it, the more intense our desire to know about it. When H. P. Blavatsky came and in her writings brought before the world the teachings of the development of Man and the Earth, telling the long ages through which both have passed, she gave the spur to all kinds of broader-minded archaeological investigations.

The civilization of the 19th century was already making of the surface of the globe a net-work of man-made lines of communication, telegraphs, steamships, railways, along which move a constant stream of people or of words linking the world of men. H. P. Blavatsky stirred up interest in all that linked men not only in this age but to other ages; and the outlook is that we shall come to more and more intimate knowledge, from outward witnesses, of what we were doing when we as souls inhabited races of past times.

## STUDENT

THE necessity for this state after death (*viz.* Devachan) is one of the necessities of evolution growing out of the nature of mind and soul. The very nature of *Manas* requires a devachanic state as soon as the body is lost, and it is simply the effect of loosening the bonds placed upon the mind by its physical and astral encasement. In life we can but to a fractional extent act out the thoughts we have each moment; and still less can we exhaust the psychic energies engendered by each day's aspirations and dreams. The energy thus engendered is not lost or annihilated, but is stored in *Manas*; but the body, brain, and astral body permit no full development of the force. Hence, held latent till death, it bursts then from the weakened bonds and plunges *Manas*, the thinker, into the expansion, use, and development of the thought-force set up in life. The impossibility of escaping this necessary state lies in man's ignorance of his own powers and faculties. . . . But while ignorance is the cause for going into this state the whole process is remedial, restful and beneficial.—William Q. Judge

## PROGRESS

INSECT and reptile, fish and bird and beast,  
 Cast their worn robes aside, fresh robes to don;  
 Tree, flower, and moss, put new year's raiments on;  
 Each natural type, the greatest as the least,  
 Renews its vesture when its use hath ceased.  
 How should men's spirit keep in unison  
 With the world's law of outgrowth, save it won  
 New robes and ampler as its girth increased?  
 Quit shrunken creed, and dwarfed philosophy!  
 Let gently die an art's decaying fire!  
 Work on the ancient lines, but yet be free  
 To leave and frame anew, if God inspire!  
 The planets change their surface as they roll:  
 The force that binds the spheres must bind the soul.

---Henry G. Hewlett

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** Is Theosophy a new religion?

**Answer** No; it is not a religion at all.  
 It is Religion, and older than  
 any of the religions.

**QUESTION.** But even savages have a religion of some sort. How can Theosophy be older than the oldest savage religion?

**ANSWER.** You evidently hold the usual view — that mankind has gradually ascended from primeval savagery to Twentieth century civilization.

**QUESTION.** Is not that the universal opinion?

**ANSWER.** It is not the opinion of Sir William Ramsay, for instance, who, in a recent *Nineteenth Century* article, expresses his concurrence with the practically universal belief of the ancient world that mankind is in a state of *decadence* from a long by-gone Golden Age.

**QUESTION.** Do you imply that Theosophy was the religion of this Golden Age?

**ANSWER.** Yes, Theosophy was taught to the people of the Golden Age. But the mind of humanity was then so different from what it is now that the mode of thinking of that age would hardly be comprehensible to us. But the same basic truths have ever been held and taught.

**QUESTION.** But if there was once a Golden Age of peace, and, presumably, civilization of some sort, why did it disappear in that utter barbarism from which we know our own civilization to have slowly arisen?

**ANSWER.** Do we know it? Do we not rather know that civilization has preceded civilization as far back as history goes? And do not the ruins scattered everywhere, of which history can tell us little or nothing, and to whose number research continually adds, suggest that the line of civilizations may be of unimaginable length into the past? When there was savagery in one place there was civilization in another, just as now.

**QUESTION.** But to return to Theosophy. Do you mean that it is as old as this suggested line of civilizations reaching in unbroken sequence back to the legendary Golden Age?

**ANSWER.** Yes and older, since some of it was taught to the first of them.

**QUESTION.** I notice that you say the word "some." Why not all?

**ANSWER.** The word Theosophy means Divine or complete Wisdom and Knowledge, and it would obviously require a perfectly or divinely developed mind to comprehend it all.

**QUESTION.** But are there men of such minds?

**ANSWER.** According to the teaching of Theosophy itself, there are. But the word "man," as we use it, almost ceases to be applicable to that height of evolution. Evolution — still according to Theosophy — was at work on planetary systems preceding ours, and such men were the flower of one of these earlier periods. It is and was, directly or indirectly, from them that our humanity receives and received Theosophy. Every civilization has had its teaching.

**QUESTION.** Do you mean that Theosophy, as you have it in your books, was taught by these men or by their pupils to, say, the prehistoric Mexicans, the Aztecs, the Sumerians, the Egyptians, the Persians, the Hindûs, the Etruscans, and the rest?

**ANSWER.** Aspects or facets of Theosophy were taught in all the civilizations you have named as well as to their predecessors. We say that at no period in history has Theosophy been silent. It has spoken through all the great religions of the world, each of them adapted to a special time and people.

**QUESTION.** You mean that all these religions and great religious philosophies, Buddhism, Mazdeanism, Mithraism, Christianity, Taoism and the rest, were what you call aspects or facets of Theosophy?

**ANSWER.** In their pure and primitive forms, as they came from their Teachers, yes.

**QUESTION.** But the religions are radically different; how can they be parts of one whole?

**ANSWER.** If you will think over what is known of them, you will find that they are not radically different. Some are obviously nearly identical under differing terminology. Some contain more, some less philosophy, the people being taught more or less of the whole truth according to their intellectual and spiritual status. You would not say that a lecturer on chemistry was teaching two incompatible chemistries if to one of his classes he spoke of "elements" and confined himself to the ordinary test-tube reactions; and to another and older group of pupils explained that the "elements" were compounds and demonstrated their transmutation one into another and their synthesis from electrons. As there are degrees in each science, according to the advancement of the students; as also, whilst there are many sciences, they are all branches of the one science of nature in her totality: so with the total of spiritual Truth, Theosophy. One Teacher selected one portion of it, another another — or a more elementary portion or degree of the same, adapting the teaching to the age and people to whom they came. Study the religions in this light and you will quickly find the thread of Theosophy.

**QUESTION.** Would it be possible to give any sort of idea of Theosophy in one or two sentences?

**ANSWER.** It might perhaps be called the complete science of the Law of Evolution. It teaches that the purpose of the visible universe is to be the home and school of life, or of lives innumerable: every such life or soul, from that of the atom upward, evolving from

the physical or merely sentient, to the mental and intellectual; from the intellectual or human to the spiritual — the spiritual including heights of understanding and bliss of which we, who are just re-entering it from the intellectual, can form no conception. That which is below the human becomes, through the ages, the human; the human gradually transcends itself into the Divine. STUDENT

**Question** According to Theosophy how would you designate that in our complex human nature which feels hunger, thirst, pain, passion, and emotion, and at another time functions through the mind and on the plane of thought?

**Answer** William Q. Judge gave the following reply to a similar question and we cannot do better than reproduce it here.

"Read the chapter of the *Bhagavad Gîtâ* which treats of Kshetra and Kshetrajña, or the Knower and the Known, as also those which describe the three qualities, their action and function. Your question deals with consciousness, and no one has yet been able to furnish its definition. The Self, who is made up of *Manas-Buddhi-Âtman*, three in one, is the knower and the perceiver. If there were no Self present, all that you have described would be merely motions in *Prâna* or the movement of the three qualities, for it is the Self who enables us to give names, derived from sensation, to these effects. And any name given to the Self, in any language, will be but the attempt of the man to name that which is nameless. In your own remarks under the question you have skipped from one subject to another, for you began with what relates to the perception of the knower while dwelling in the body, and ended with the essential nature of the monad, an entirely different matter. This confusion of topics will only create confusion in your own mind. There is no benefit from increasing words on the self-perceptive cognition, for all that you can say of it is that you possess the *I am I* consciousness. Hence all that you have said can be resolved by the statement that the consciousness functions in many different planes of experience, and in each one uses the means or instruments appropriate thereto. And in order to so pass from one plane to another, holding intelligence in each, the presence of *Manas* is necessary as one of the integral parts or powers of the Self, for without *Manas* we are only of the brute or lower kingdoms. For one moment consider the brutes who, moving and dwelling in the mental plane with man, know nothing of our mânasic sensations. It is because *Manas* is dormant in them; but in you it has begun to awake, thus enabling you as man to note the effects upon yourself of the motions of the qualities of nature."

STUDENT

THIS perishable body is known as Kshetra; those who are acquainted with the true nature of things call the soul who knows it, the Kshetrajña. Know also that I am the knower in every mortal body, O son of Bhârata; that knowledge which through the soul is a realization of both the known and the knower is alone esteemed by me as wisdom.—*Gîtâ*

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West.

## Higher Ideas of God and of Man

A UNITARIAN clergyman is reported to have recently spoken as follows: Our modern science has changed and elevated the idea of God held by intelligent minds. He is no longer a being with bodily form, located in some material heaven up in the sky, from which he has come down on occasion to interfere. In enlarging the universe from one small world to unnumbered millions, and its age from 6000 years to uncounted ages, science has "lifted God up really into infinity and eternity."

Evolution has done away with the crude idea of a mechanic-creator, outside of all things. Instead we have the idea of a God immanent in Nature, the energy, the life, at the heart of it all.

Evolutionary science says, "An Infinite and Eternal Energy from which all things proceed"; religion says, "God." Put the two together, and we have Nature as God's visible manifestation—His garment, so to speak, or, better, His body—Himself being the Soul of all, the Power that energizes all, the Intelligence that shines through all, the Will that directs all.

These admissions of course undermine the whole basis of Christianity as an exclusive and specially authoritative religion, and put other religions on a par with it at least. With such a belief as to the Deity, what becomes of Jesus? Can an infinite and eternal Energy have a son and send him to earth to die for humanity? Jesus becomes thus a great Teacher, a holy man, a conception infinitely nobler than the former; and there have been many such, according to Theosophy.

It behooves these broad-minded Unitarians to follow up the consequences of their bold and in many ways noble proposition, and see what corollaries are deducible from it. One such corollary is the idea of Man as the highest manifestation of the Deity—on earth. For Man, besides possessing the divine gifts which he shares in common with the rest of Nature, also has the divine quality of reflective self-consciousness; so that he is not only Divine but able to contemplate his Divinity. This conception of Man involves new ideals of duty and destiny.

It is necessary to guard against what is sometimes misnamed pantheism—*per se* a highly elevating and philosophical conception

## MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed: it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

—for the current notion of that belief is *really a degraded conception* of pantheism; that is, the idea that Deity is *merely* the soul of Nature and that his attributes are chiefly such as science attributes to Nature: abundant life, and an apparently ruthless and indiscriminating law. This notion is sometimes conveyed by modern science.

There is also an inner Nature which represents a higher manifestation of the eternal Deity—the highest we can reach. Outer Nature is but the outer manifestation of this. This inner Nature we can find in the depths of our own Being; it is that whose law is Righteousness and Compassion, freedom from personality and desire. It is the part of Man to show forth this *inner Nature*.

Let us study the world's scriptures, and there we shall find plenty of description of the nature of Deity in so far as it is *revealed in the man* who aspires to perfection. Deity is impersonal, and Man has to seek a center in himself which is superior to the personality and not subject to the continual pullings and pushings of desire. He has to find a Life which transcends death and birth, for the life which is born and dies is his lower nature and not his Divine Nature.

In short, if modern progress has elevated the idea of God from that of a fetish, has it not also elevated the idea of Man from that of a mere creature to that of an independent Will? Must not Man now use his intelligence and will in the endeavor to be something more than he was before? Should he not try to realize the Divine possibilities of his nature and to rise above the limitations hitherto imposed on him by his false beliefs? Need Man continue to be a slave to his own weaknesses and doubts, while clamoring for a so-called freedom that is neither pleasant nor profitable to him; or can he now win his way to a truer freedom such as no circumstances can take away—the freedom of his mind and heart and will from vain desires and profitless pursuits that enchain the soul within?

Aye, let these broad Christians preach a new idea of Man and conduct—one that shall be worthy of their idea of God. For Man is the one center of all our duties. As long as we speculate on the nature of God, we are apt to separate God from Man, thus reducing Man. Man must act from his own center, not from an extraneous power acting on him or through him.

STUDENT

## What is True Science?

PERHAPS the most common form of in-differentism towards the meaning of life as interpreted in the faiths of mankind is that these are matters of sentiment only, or of expediency; and whether among savage or civilized peoples are useful mainly as means for preserving the social order. Hence we pay our clerics to run the ethical machine for us, so that we can send our families to church Sundays and occasionally go ourselves, leaving the rest of the time available for attending to more practical affairs. And although this view has been known as a transparent fallacy by the seers, poets and great teachers of all ages, our modern priests, who are now in scientific garb, have not hit upon the key to unmask it. They do not know that there is an old treatise upon dynamics, nature forces, one page of which contains more pure and applied science than all our modern treatises combined! Emerson, Whitman and others were inspired by its poetry, its philosophy, its grandeur; yet it is not so clear that they discerned its science, for this does not lie upon its surface. The basic truth is so profound, withal so simple, that it eludes the mind not deeply concentrated thereon. It is, that back of the visible and *invisible* worlds of form lie the *formless* worlds from which the former emanate, these formless worlds having a vivid intensity of consciousness transcending anything we can imagine. Conversely, just as consciousness becomes immersed in form (and sensation, the conscious accompaniment of form) by just so much is the vividness of consciousness obscured. It is in the formless worlds that the creative powers of the soul abide. Hence if we wish to get back to realities, we must break from the habit of identifying ourselves with our personal sensations and desires; take a broader view of life; recognize the soul-brotherhood concealed within these outwardly separate-seeming beings; and *act* as all the Great Teachers have indicated.

# The Theosophical Forum in Isis Theater

S a n D i e g o C a l i f o r n i a

## LAST SUNDAY AT ISIS THEATER

### Violin Solo by Tiny Lad A Feature Preceding Program at Isis, Extracts From Theosophical Teachings Are Read

A LARGE and appreciative audience greeted the performance given by the Râja Yoga boys and youths at the Isis Theater last night. The program included ten numbers and the manner in which they were rendered elicited unstinted applause. The stage was most elegantly decorated with cut flowers and ferns forming a beautiful setting for the performers.

The first number was a prelude to *L'Arlésienne*, by Bizet, which was cleverly rendered by the Râja Yoga orchestra. The orchestra evidences the thorough and systematic training and practice that is exacted by its leader and plays in perfect harmony.

A clarinet solo, *Spring's Awakening* by Bach, performed by Iverson Harris, Jr., was appreciated.

By far the star feature of the evening was the violin solos rendered by Master Geoffrey Barborka, a tiny lad, surely not a day over 7 years of age. His perfect rendition of *First Air Varié* called forth vociferous applause. With remarkable self-possession the young virtuoso responded with an equally beautiful selection which he played with the skill and touch of a master.

An address on "History," by Wilbur Hiney, dwelt on the similarity of the adolescence in youth and in nations. Both learned the lessons needed to perfect character through early struggles.

The musical gem of the evening was *Satz*, by Schubert, played by the Râja Yoga string quartet, which evolved the most exquisite melody from the selection, equal to the performance of the most cultured professional players.

A solo on the 'cello by Montague Machell was received with much appreciative applause. The youth later addressed the house on the topic of "Râja Yoga," explaining its purpose and the scope of its work, pointing out the benefits derived by the children fortunate enough to receive their training under its auspices. "Teach a man that he is a soul and give him a chance," was the precept of Mrs. Katherine Tingley around which the theme of his address was woven.

Hubert Dunn rendered a violin solo, *Sérénade Mélancolique*, by Tchaikowsky, with particularly fine effect. Last, but not least, was the *Wedding March*, composed by Rex Dunn, leader of the orchestra, which held the audience entranced to its close. Before opening the musical program the members of the orchestra read in turn brief extracts and precepts from the teachings of H. P. Blavatsky, William Q. Judge and Katherine Tingley on the subject of Theosophy. — San Diego Union

### Learned Twaddle About Psycho-Physiology

AS people in modern times recognize in general no true Science to instruct us about our own nature, that field of inquiry has been left to materialistic science; a school that regards the criteria of the physical senses as the starting-point of knowledge and considers the more real existences, such as thought and feeling, as secondary thereto. The result is seen in the tendency towards creating a materialistic or animalistic philosophy of life, in which the physical body of man plays the chief part, ignoring the higher nature.

Fortunately, however, the damaging effect of such a materialistic propaganda is considerably lessened by the pedantic manner in which some scientists go about their investigations. When they undertake to discourse upon emotions and thoughts, they use the very same dry method as is appropriate to a study of fossils or bones; and this gives to their lucubrations that air of solemn trifling which makes the ordinary person so good-humoredly scornful.

To prove that this is no exaggeration, at least in some cases, the following is quoted. Says a current review:

Much attention has recently been given to the physiological phenomena of emotion. These, which used to be considered merely as accompanying the grief, fear, joy, or whatever the emotion might be, are now widely regarded as a part of the emotion itself.

Thus tears are not, as was formerly thought, merely an accompaniment of grief, but are actually a part of grief itself. Scientists are not concerned with metaphysics, but it might be better if they were; they might then be more comprehensible! The review then quotes a Paris paper to the effect that—

Every vivid emotion manifests itself outwardly in the physiognomy or attitude.

One seems to have known this before; but, to continue:

William James says that objects of anger, love, fear, etc., not only impel man to outward acts, but provoke characteristic alterations of posture and face, affecting in various specific ways, the respiration, circulation, and other organic functions.

William James is coming along—slowly! The choice of words reminds one of that ancient poem:

This is the domiciliary edifice erected by John.  
This is the partially fermented grain that reposed  
in the domiciliary edifice, etc.

In ordinary language, "The House that Jack built." To continue:

When the external acts are inhibited, these latter expressions of emotion persist; we read anger in the face, even if a blow has not been struck, and fear may show itself in the voice and the complexion, even when all other signs of it have been controlled.

But about tears. Grief, it seems, causes the vasomotors to contract, whereby blood is expressed from the small vessels and the various tissues and organs are exhausted of it; from this come pallor and collapse; the various secretions are diminished. But, if the secretions are diminished, how shall we account for the copious flood of tears which ensues? Answer: "It is the effect of the reaction that follows a state of vasomotor contraction."

When we weep, all the tears are furnished directly by the blood of the lacrimal artery, that is to say by the blood of the internal carotid itself. Thus an abstraction of water, and of albuminoid and chemical substances, at the immediate expense of the cerebral blood, takes place in the act of shedding tears. This loss of serum produces the

effect of a slight local loss of blood, dulling the centers to pain for some instants and bringing relief to the weeper. . . . Blessed are those who weep, whether they be sad or gay; for they are decongesting their brains!

The duality of the mind is, however, recognized; for we read that

In subjects plunged in the hypnotic sleep, the imposed attitude controls the thought. Make a hypnotized person kneel and clasp his hands, and he will recite a prayer. . . . In the hypnotic state there is disaggregation of the two psychisms; the inferior and automatic personality obeys the impulses suggested by the attitude, while the superior personality may resist. To a lesser degree in the normal state, the attitude acts on our thoughts, and an effort of the superior personality is necessary to resist it.

This of course merely amounts to saying that man has impulses and a power of self-restraint. The scientists have lent the matter an air of novelty by clothing it in the latest psycho-physiological language. What is most needed, however, is a physiology (so to say) of the "superior personality," the man that controls. As it is, undue importance is given to the inferior personality, because more is known about its physical mechanism. But there is also a science of the higher powers of man; and, if this were better known, it would be seen that all the psycho-physiological processes are subject to the higher control.

It is admitted that if the will be removed—say by hypnotism—the elemental forces that live in the cells will predominate and control action; even in the weak man this will and does happen. To some extent *all* ordinary people allow it to happen. But it need not happen. The enlightened will should control the mind and emotions, and the mind and emotions will then control the physiological processes. All this is clearly explained in Theosophical writings on the Seven Principles of Man.

The worst of these elementary theories is that they rush too hastily to conclusions and do not realize the extent of the subject they are dealing with. Thus they divide man into two parts—an inferior and a superior personality. But the matter is far more complex. To put it roughly—the physical body is controlled by the fluidic body; that again by the instinctual mind. Thus much happens in animals; but man has the intelligent mind also, which in its turn can control the instincts. And even the intelligent mind is itself inferior to the higher mind.

This is not the place to go into lengthy details on the teachings as to man's constitution; but they can all be found in the Manuals. It is important, however, to show that the pronouncements of these physiologists are really only rambling guesses, like a child's idea of the outer world, and likely to mislead anyone who should be influenced by them. Let those who desire something serious and worth thinking about read the Theosophical teachings on the subject. STUDENT

### 'Civilization'

A CHICAGO paper chants through half a broadside of a Sunday issue the present and coming splendors of that city. We read of its size, its manufactories, the annual bulk of beef that it ships, the skyscrapers that it possesses, the steel it produces, and so on, and so on. In fine "Chicago possesses a larger number of the 'greatest things on earth' than any other city in the world." The efforts of its founders "have resulted in the greatest material development the human race has ever witnessed in a similar length of time."

But the population! "The combined populations of Boston and St. Louis, two of the largest cities, are not equal to that of Chicago; add Cincinnati and Indianapolis and you have not got a Chicago; then, after adding Omaha and Denver, you still have to throw in Des Moines to make a Chicago."

The one thing the writer forgets to note is the *quality* of the population. But another writer in another part of the same paper makes up the deficiency. Perhaps the editor was sleepy when he let the two articles go into the same issue.

From this other writer we learn that:

"Forty per cent of Chicago children have defective vision from one cause or another. (If we add trachoma and other eye diseases, we get eighty per cent.)

"Sixteen per cent are suffering from hearing defects.

"Twenty per cent of all grammar grade pupils are suffering from some defects of nose, throat, or mouth.

"Fifteen to twenty per cent have defective bodily movements, attitudes, and postures.

"Forty per cent of the native children are nervous.

"Sixty-five per cent are below normal in height, weight, and strength.

"Seventy per cent are anaemic.

"Thirty-three and one-third per cent are victims of chronic fatigue."

The article is headed with the sentence: "What the Chicago Man Will Be in 1950."

The succeeding sentence is: "Educators say he will be lopsided, stunted, lazy, near-sighted, anaemic and nervous. . . ." We might add that about 1 in 400 is now insane; that the proportion is rapidly rising; and that for one called insane, there are ten on the border.

We are making no attack on this particular city. It is not a bit worse than many another. But this Sunday issue of one of its papers happened to be available for the pointing of a moral: — the moral that immediately alongside of a paean of glorification of one of our great centers of "civilization," an almost chanted prediction of the glories of its future, were statistics pointing towards *extinction*. This spreading whirlpool of material activity whose whirl and spread we are called upon to admire — and to admire ourselves for producing — almost to worship: is in the same picture shown as swiftly destroying its creators and admirers! If civilization is mere magnitude of things and doings, then we are civilized. If it is more life, better life, sweeter and saner and loftier life, then we are further from it than we were a century ago.

Now it is evident that if the conditions

represented by those statistics go on for another century, physical degeneracy will have put an end to the scene. Those who are capable of thinking, and who think it will not, must be figuring to themselves some cause which will change the picture, which will stop the degeneracy. What is the cause whose advent they are thinking of? It must be something not now at work. At work already in that same city are churches by the hundred, libraries, educational institutions of every kind — scarcely touching the evil.

This country had a great chance: youth, the experience of history, the example — if one to avoid — of the older countries, a virgin land. What has it done with its opportunity? Has it produced a nobler physical manhood? Think of those statistics! Has it produced a higher regard for human life? Think of the annual army of the slain in accident and in crime. A nobler journalism, a cleaner political life, swifter, cheaper, and surer justice? Happier life? Think of the growing army of suicides and insane! Easier life? Think of the figures: — one person in fourteen out of reach of the *necessaries* of life. A cleaner private life? Think of the divorce lists.

The country *had* a great chance, the chance, the opportunity of ages. Has it still any of it left? Or is it lost in greed, unbrotherhood and spiritual stagnation? Must the Spirit of Progress try again, *elsewhere*? STUDENT

### A New Form of Insanity

THE average man never hears the sighs of his astral body for its long lost freedom. If he did, the unfeeling creature would probably pay no attention. Provided he knew how, he might even drive the cork in a little tighter. What, he would say, is man without a well-disciplined astral?

Whatever this average commonsense man knows about the astral body, he has learned from Theosophy. And the more he studies Theosophy the more fixed he will become in his determination to give his astral no chance to play pranks. He will know that it has fixed duties as the vehicle between his will and his body, and between nature-will — which is vitality — and his body. He will know that these duties are being ill-discharged when, as in the case of the medium, it becomes unstable and wobbly; or when, as in the case of the common clairvoyant and clairaudient, it takes to receiving and misinterpreting half illusive impressions on its own account and projecting them before his eyes and ears. He knows that he is failing in *his* duty to *it* in trying to hypnotize himself or in letting anyone else hypnotize him, since it will never again function for him quite perfectly; and that the only sane way to act on it and perfect it is from above — *by clarifying, invigorating, and spiritualizing his mind*.

And he knows that the cultivation of any of the ordinary clairvoyant, mediumistic, and hypnotized conditions is to move straight away from the path taught by Theosophy and by the three Theosophical Leaders.

What will this average commonsense man think of an attempt to "free the astral body" by depriving the physical one of food *for a term of weeks*?

Periods of abstinence as a medical measure

we know of; fastings of a meal or two, or a day, to "subdue the flesh," was a common enough monastic disciplinary measure — not always, then or now, for the monks or us, out of place. There were also *partial* abstinences for longer periods.

But a lengthened and complete fast "to free the astral," is a scheme which students of the fantastic, will classify with some difficulty.

It is not Theosophy, though it could have suggested itself only to a brain which had dabbled in a little Theosophical teaching — seeing them, however, as through a glass, very darkly, very wrongly and distortedly.

But perhaps the idea is to find a short cut to moral perfection. Time was when the perfect cleansing of character was thought to require a lifetime, and he was accounted to have indeed well and worthily lived who had accomplished it in that time.

We have changed all that. That was in the days before electricity, before diseases were so kind as to flee — if only under cover — as soon as you had denied their existence or informed them that "God is All," and before you could get every desire gratified by merely mentioning them to "The All-Encompassing Good."

So you can now flourish about with a halo and a freed astral body merely at the price of a little starving. C.

### Three Generations of Deity

THERE were great jubilee celebrations in February at Lourdes in connexion with the fiftieth anniversary of the discovery of its healing powers. An anniversary sermon was preached by Bishop Rumeau, in which he said:

Yes! Mary is Immaculate. For all the three Persons of the Trinity have combined to confer that glorious privilege upon her who is the daughter of the Father, the mother of the Son, and the bride of the Holy Ghost.

This seems complicated, making the "Father" the *grandfather* of His "Son." Pagans are accused of deifying natural phenomena. But that was at least stepping them *upward*. It is surely better to deify nature than to carnalize the Deific. STUDENT

### Sending City Boys to the Farms

TEACHERS in the boys' schools throughout Greater New York are planning to send 3000 boys into the country next June to spend their vacations as farm laborers. The boys will find the labor less laborious than idleness or odd-jobbing in the city. Over 2500 have already been enrolled.

This plan was announced to the Senate finance committee on a bill appropriating half a million dollars annually for agricultural fairs and exhibitions both in the country and New York City.

All the boys who have hitherto gone to the country have been given work, and some have induced their parents to buy farms. T.

ENCKE's comet, which will make perihelion passage in June, has a diminution in its periodic time of about two and two-thirds days, from which circumstance he inferred some resisting medium in interplanetary space. Perhaps the comet has its own views upon the cause of its acceleration. J.

# Art Music Literature and the Drama

## A Japanese on Western Drama

A JAPANESE journalist, recently visiting England, has contributed some interesting remarks on the drama both in England and Japan to one of the London papers. He says that Europe is not so European as he expected to find it, that the main impression he receives is that the world is a very human one, where people of all races entertain similar feelings—

Where humanity stretches out to humanity, even the lack of a common language cannot prevent understanding. In the feudal ages of Japan, when the country was divided into small principalities, the different dominions kept largely apart. When the vassals of a lord of the north-east of Japan happened to meet with those of the southern Satsuma, the tone and accents were so different that they could not understand one another.

What did they do on such occasions? They sang a certain kind of song, the kind we call "utai." The "utai" served as the medium of communication, not only because the language used was, as it is now, uniform all over Japan, but because the tone contained in it appealed to the common feelings of humanity. Tastes may differ, but not the senses. The beauty of England is certain to be admired by the Japanese, and *vice versa*. So in visiting the English theater the main thing that came home to me was that the artistic expression of the emotions, whether shown by the great actor of England or the great actor of Japan, appeals to those primary instincts of the people of both nations alike that arise above the limitations of differing speech.

Others who have approached the spirit of Japanese life with that sympathy which alone bestoweth understanding—and how few of them there are!—tell us that one may find upon the Japanese stage the exemplification of the highest kind of histrionic art. Says one writer:

To a foreigner who does not understand Japanese the whole proceeding is mysterious and incomprehensible; the whole acting is in the face of one actor, which is watched by perhaps three thousand spectators with extraordinary closeness and suppressed excitement. . . . In their acting there is no strutting, no raving and ranting, and no gesticulation. The most intense and passionate scenes are the quietest; a dead silence pervades the vast audience; there is no motion on the stage except in the lips and facial muscles of the one chief actor—his body, arms and limbs are restrained from gesture.

## AN ENGLISH STUDENT IN LOMALAND

## A Note of Higher Patriotism in Modern Drama

A PARISIAN paper contains an interesting account of the Peasants' Theater, which was recently re-opened at Meran, Tyrol. It is an open-air theater built upon a broad meadow near the town. The stage settings represent a village street with peasants' cottages, with their usual decorations of maize

and shrubs. The play itself has been given regularly for fifteen years by the enthusiastic peasants of the village, of whom about three hundred and fifty are enrolled as actors. The theme is a patriotic one and many of the actors are grandchildren and great-grandchildren of the old patriots whose deeds they thus commemorate. While the place is not so widely known as Oberammergau, many Americans and English attend the performance every year and they declare that no one could remain unmoved at the lifelike, impassioned acting of these simple peasants.

To all this add the beauty of the surroundings. But a little beyond stands the beautiful Castle Tyrol and almost above the stage rise the glorious mountains which once echoed with

the musketry of the sturdy peasants who drove back their old enemy.

And what must not be the influence of this upon the population? What must not be the temper and mettle of boys and girls reared in an atmosphere of patriotism, of gratitude, of devotion, and reverence for the glorious qualities of their ancestors? It reads like an account of the way they did in old Sparta and Athens. How many more cultivated centers in Europe and America afford so much of inspiration and the higher teaching to their students and little children? A truth that has been to a great degree lost sight of by the learned is here perceived, understood, and translated for the world's reading by the unlearned.

STUDENT

## The Drama of the Future

M. HENRI BATAILLE, the Parisian dramatist and reviewer, is soon to publish a book upon the drama, it is stated, and in advance of it the *Paris Figaro* prints a lengthy article from his pen upon the same subject. From the *Boston Transcript* we quote the following translation, or rather, excerpts from it, the Theosophical tone of which is an inspiration. STUDENT

It is absolutely indispensable to renovate, cleanse and strengthen the warped mechanism of the drama. That is the task of the future. Let the visual field of the stage be broadened, let the characters in the play no longer leave their lives behind the scenes, let the audience feel that they come already laden with a past, issuing from a childhood or youth clearly defined, and that they move toward a point where memory will prolong them far beyond the play. . . . Let the words no longer be the stage words, with their special syntax in which replies are tossed to and fro like tennis balls, but let the words be winged, as if borne upon the wind and with the breath of life in them; we want to feel that they come from the depths of character, that they interpret character, however well or however ill, with its obscure resonance—a whole inner language, a whole thronging lyricism, the expression of purposes, sufferings, enthusiasms, desires. And yet let all this be as commonplace as everyday life and vast

as eternal nature. I feel that such a drama is coming. . . . It will surely come, and when it does it will express all our modern life, its strength, its weakness, its infinite simplicity as well as its extreme complications, the poverty of its intrigues, the intensity of the emotions that agitate it—in short all that we are, the personal tragedy or comedy of each individual, with his participation in the life of the universe. Such a drama must translate not only our struggles, our inner conflicts, our exact sensibilities, but must also be impregnated with the collective efforts of society, reflecting the stages of our moral progress, keeping step with our forward movement. . . . It must show . . . the immutable laws of nature, that eternally preside over our acts, . . . at once vast and simple, sincere always, the sole true drama, the drama of Conscience and Destiny.

Lomaland Photo. and Engraving Dept.

HEAD OF ATHLETE—FROM A GREEK STATUE

## SPRING

GOTTFRIED HULT in April Century

WHAT time the prairie still lay bleak and froze,  
I sauntered forth, like some old palimpsest  
That waits new writing for the old suppressed,  
Such seemed the dreary fields I wandered o'er—  
A worn, age-yellowed parchment, little more.  
Fragments of words whose thought could not be guessed,  
And not a single spear of grass to attest  
That here would yet be lavished a new lore.  
To-day upon the selfsame fields I stroll.  
The selfsame? Nay, the mighty vellum hath been  
Illuminated with its summer green.  
As long as spring is spring and soul is soul,  
I ask not why earth, sky, and all between  
Have not been tossed aside, a crumpled scroll.

THERE lives a woman in Lomaland whose quiet manner and simple exterior are but halting heralds of the richness of soul beneath—who consecrated all her strong young womanhood to the bearing of the burdens of others, who has known the sweetness of sacrifice and the blessedness of renunciation. One day, while passing through a little plot of terraced soil at the edge of the Homestead gardens, a plot devoted to wild shrubs and smaller wild blossoming things, and which had been started by our hero, Ralph Wythebourne, she noticed that the plants looked a bit neglected, or—well, perhaps lonely. For since the awful day when the beloved student and teacher laid down his life that four other lives might be saved, no one had tended the wild things, for no one seemed to have time. Something touched her heart; at any rate, the next day she transplanted from the hills to this plot a very rare white-blooming plant, "in Wythebourne's memory." Doing this, she noticed that a few of the plants had died, that others looked a bit "seedy," as it were, others a bit discouraged, that the yuccas were running wild and the hedge had grown ragged and unkempt. In short, it was only natural that she should prune here, straighten there, cut back a runner or two and irrigate. The leisure hours of the next day were plainly needed to complete just the doing of necessary things, and then the day after that, until she finally came to spend all the time not devoted to regular duties, in this wild-flower plot.

Familiar as was this Student with the flora of Loma hills, the problem of carrying out the plan begun by our hero-comrade very quickly presented itself and was as quickly solved; for, having a scientific knowledge of botany, our friend knew how, when and where to select. Almost daily trips to the hills resulted very soon in many and rare additions to the collection, not one to be easily made, by the

### "Out of the Heart—"

way, for wild things prefer their own habitat, grow peevish and obstinate under transplanting and very often die. It is a much simpler

. . . BUT though they have been repeatedly told of this *sine qua non* rule on the Path of Theosophy and chelaship (a clean life) how few of them have given attention to it. Behold, how many of them are sluggards in the morning and time-wasters at night; gluttons, eating and drinking for the sensual pleasure they give; indolent in business; selfish as to the keeping of their neighbors' interests in view; borrowing from brother-Theosophists, making money out of the loan and failing to return it; lazy in study and waiting for others to think for and teach them; denying themselves nothing, EVEN OF LUXURIES, for the sake of helping poorer brothers; forgetting the Cause in general and its volunteer hard workers;—and even debauchees, GUILTY OF SECRET IMMORALITY in more than one form. And yet all call themselves Theosophists; all talk with outsiders about "Theosophical Ethics" and things, with a puffed-up, vain conceit in their hearts . . .

[NOTE. The above strong indictment of pseudo-Theosophists was written nearly twenty years ago in a private letter to H. P. Blavatsky by one of her Teachers. How have the succeeding years justified these words and revealed Katherine Tingley's wisdom in publicly pointing out the difference between true Theosophy and the many despicable hypocrises that keep trying to masquerade under its name!—(Italics last sentence only, mine) STUDENT

matter, the moving about of cultivated plants, as any expert will attest.

This has gone on for some months. Today, instead of a neglected plot, scarcely to be distinguished from other neglected plots the world

over, there is one of the most charming places imaginable. Where other gardens are "set" and ordered, this has been left to the beauty of Nature's most artistic irregularity, here terraces, there mounds, again a depression which, by considerable work and skill, is being fashioned into a grotto over which wild vines will hang. Here, at the head of the garden, and near to the water-supply, is a rocky mound, between the stones of which rise ferns of a dozen varieties, wild trilliums, and one tall, important-looking specimen of the *mimulus glutinosus*.

Down from this mound leads a little pebbly runway for the water, so disposed that it is difficult to believe that Nature did not form it herself. Yet every pebble, every stone, in it was brought from quite a distance by the hands of this lover of wild-flowers. It is not yet finished, but already suggests strikingly the structure of the Japanese garden-scheme, so absolutely simple and unaffected is the charm of it, so surprisingly great have been shown to be the artistic possibilities of simple stones. Who that remembers with a shudder the mercilessly regular stone-bordered walks and flower beds of some country yards, has not found himself wishing that small stones, at least, did not exist? What a step from that painful geometry to the lovelier use of stones such as the Japanese have taught us!

To walk through that garden, even for one who has forgotten all his botany and has not this nature-lover near to explain this and point out that, is a liberal education on more than one line. When completed each little plant, shrub and tree will have near it in tiny white letters on an invisible green ground, its botanical name, *arctostaphylos bicolor-manzanita*, *isomeris arborea*, *eriodictyon tomentosum* (our own "Yerba Santa"), *quercus dumosa*, *linaria*, and the rest, and for students of botany the place will be almost a mine of information. There are already in the garden a

number of very rare plants, and several of which there is no accessible record of any previous discovery or analysis.

But the charm of the place would appeal to some more than its scientific value, although that is considerable now and will be very great indeed by another twelve-month. The only concession to civilization so far made comprises a few plants—just enough for “specimens”—which are sacred to the memory of our Grandmothers, although not planted “in a row”—thyme, rosemary and bay, pennyroyal, fennel, mint, hoarhound, rue, and others. All the rest are straight from the heart of the hills and are planted in little irregular clumps “so that they will feel at home,” says their sponsor, but really because her scientific knowledge of botany has given her wisdom in respect of the choosing of the environment in which a plant will “do best.” The whole thing is in the spirit of Nature herself.

Of mariposa lilies there are perhaps a dozen varieties, some very rare, but not set stiffly in a single group; here is a specimen of the “bow-string hemp,” near it that rarest of flowers, a pale *mimosa*; over there a clump of purple *linaria* lending brilliant color, and in juxtaposition the beautiful blossoms of the purple figwort.

Here shines out the timid magenta of a wild sweet pea, and not far away the most remarkable specimen of wild snapdragon that could be imagined, a profusion of long feathery blossom-clusters, the single plant measuring not less than seven feet from the tip of each cluster to the tip of its opposite!

Across the path is a struggling specimen of *quercus dumosa* or scrub-oak, of which only a very few still remain on the hills and which is one of the hardest of plants to “make grow.” Sea dahlia and California poppy lend their brilliant color, nearby them is a little group of those plants so beautiful to the eye and so offensive to the sense of smell and which plainly reveal their kinship to two others that are first cousins, truly, though we rarely think of them as such—the onion and its queenly relative, the hyacinth. A big eucalypt rises proudly up to shade them and not far away is a generous low-branching elder. Most of even the trees are yet small, however, and a sense of the humorous comes over one at seeing a tiny sprout, little larger than a mariposa lily, labeled “*Sequoia gigantea*—California Redwood”! The pines are yet small and the cedars too; but an acacia which was raised from a seed is now several feet high and as delicate as any sensitive plant in the pure grace of branch and leaf. Over the stones near the lower rockery are some tiny plants (already in blossom, though) of the sand verbena, so delicate that the purple-tinged flowers and lilac stems seem ghostly, crystalline. The curiously beautiful flower of the *clarkia elegans* we meet on an upper terrace, and not far away the wild “Canterbury Bell,” smaller but far more lightsome and wand-like than its stilted, cultivated sister. In one corner is a group of cacti, near by, several yuccas. *Yerba Santa*, just now in a profusion of purple

bloom, stands guard near the gateway; and so one might go on for pages if each plant were to be enumerated. Incomplete as the collection is at present it has gone quite outside the range of our books on Californian wild-flowers in some respects, and the future will doubtless add it to the list of Rāja Yoga educational assets.

And yet what is its real lesson—that botanical specimens are good things to have, especially when not cut, killed, picked to pieces and dried? By no means. The real word spoken by this garden to the sympathetic visitor is out of the heart, out of Nature's heart. Its word is that of life's great Universal Soul. Is the garden of value educationally merely because the gardener has sufficient scientific

HELENA PETROVNA BLAVATSKY

knowledge to label things correctly and can tell a family from a *genus*? Not at all. It might be of use to the ordinary educational institution if built up on a brain-mind basis, but Rāja Yoga makes a different demand. It is of value here because it grew from a loving thought *translated into action*, not a loving thought that died as nothing more. It grew from the spirit of a living gratitude, from that heart-quality which does not have to have an admiring audience before it can find it worth while to speak out in a *deed*. And it disabuses the skeptical mind of another cherished notion, the notion that good things, of course, may come from kindly thoughts—such as flowers to prisoners, or nursing in war-hospitals, or helping support orphans' homes—but that nothing of any real scientific or text-book value ever comes from such a feminine little source! That is just where our scientists blunder. The scientific knowledge that is not nourished in the soil of the heart-life may do for educational institutions in which the brain-mind test is the chief one, but it takes second place in Lomaland.

Within the week occurs the anniversary of

the death of Helena Petrovna Blavatsky—White Lotus Day, of deep significance and heart-import. It is in tribute to her alone that the above is written, to accentuate the doctrine for which she died a thousand deaths, the doctrine that “Out of the heart come the issues of life.” Solomon did not dwell upon the fact that out of the brain-mind do *not* come the issues of life. Perhaps in his day human minds, “stiff-hearted” and “stiff-necked” as generations came to be later, did not need it so much as now. But H. P. B. not only accentuated the positive side, pleading as before some mighty bar of justice for the heart to be given its rightful place in human life, but she dwelt with burning emphasis upon the other side, smashing and pulling over the high and mighty pedestals upon which we had enthroned our brain-mind gods, and urging men to recognize the mind as one of life's servants, one of its instruments, merely.

This was her work, to show us that science must pursue the path of love or fail in its quest, that path at the end of which rise the Gates of Gold, through which none may pass save he who hath passed them already. To accentuate this teaching at this time—what tribute more fitting, more just? STUDENT

#### Lest We Forget

ACCORDING to a dispatch from Blackburn, a Lancashire cotton-spinning center in England, they are solving the problem of how to care for the children when there are not nursemaids enough to go round, in a manner that is unique, to say the least. The cotton mills absorb practically all of the labor of the women and girls of the place, and as many of the mothers work in the mills themselves, the problem of “who will mind the baby” has been assuming serious proportions. The dispatch states that the Gordian Knot has been cut by the employment of old men paupers from the neighboring poorhouse, these derelicts of humanity being glad to take care of the children for small wages in order to keep themselves in beer and tobacco! But what about the children? What a picture of injustice! What can be expected of these little souls in the future if their infant and childhood days are to be surrounded with examples of slovenliness and senility? This is helping humanity with a vengeance. And yet one must not harshly blame the poor mother who allows this, for the small wage she earns in the cotton mills is too often all that stands between her little ones and semi-starvation. She is crushed under the rim of a slow-turning wheel. It is for us to discover the cause of its pitiless turning. What a world this is—in the light of what it might be! Can we wonder that Katherine Tingley said some years ago, in the course of one of her impassioned addresses: “If it were not for the flowers and the birds, the blue sky overhead and the grateful growing things under my feet, I would lose hope, so awful is the picture of man's unbrotherliness to man.” The above is not a pleasurable paragraph, but we need occasional glimpses of life's pitiable mistakes—lest we forget. STUDENT

# OUR YOUNG FOLK

## Thoughts for White Lotus Day

THE first thought that comes is, "O that every boy and girl in the world this May morning might, while full of the freshness and buoyant hope of youth, learn of the great ideal of Brotherhood which Helena P. Blavatsky brought to the world at the end of the nineteenth century!" Golden boats pass in myriad fleets every day from Lomaland to the boys and girls in all countries; and the dawn of White Lotus Day, the day sacred to the memory of H. P. Blavatsky, will lend its glow to this best wish for the young hearts everywhere.

Râja Yoga boys and girls, and those in the Lotus Groups, know H. P. Blavatsky as the fearless founder of THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY. They see her standing alone in the world in 1875, courageously holding aloft her banner with "Theosophy" the magic word upon it. She held it thus until had gathered around her those who helped to carry on her work, among them one, William Q. Judge, to whom she left it as a sacred trust until should dawn the time now known so well to the young folk, the coming of Katherine Tingley and Râja Yoga, and the glad new day that now shines wherever Theosophy and Râja Yoga have found their way.

On White Lotus Day, therefore, loyal hearts, some of which were first quickened to real brotherly life by H. P. Blavatsky herself, send a loving greeting to the great Warrior-Soul who stood alone and sowed the seeds that have grown into the great Schools and Centers that are spreading over the world like rays of sunshine from a great central sun. Every year as Theosophy, which H. P. Blavatsky brought, is applied to the needs of the people in the world, greater and greater grows our love for her, and deeper grows our interest in the wonderful life she lived. For it was a wonderful life—to search for and find what would help all humanity, and to live only to share the treasure with all.

First there was the search. There are always people in the world who are seeking wisdom and many more seeking learning, and they go to colleges and schools and teachers, and travel and write down what they learn in books, and no one is much the wiser for it. They did not know just what the world needs, and they were not pure and unselfish enough to be entrusted with it, even if they had known, and so they do not find the treasure. H. P. Blavatsky did. When there is one with a great heart like hers, the way opens, the treasure can be found. Indeed so rarely does it come to pass that there is a worker pure-hearted and strong-souled enough to seek for a treasure to be shared with all humanity that when there is such a one all the sacred places

HELENA PETROVNA BLAVATSKY

THE hope of Truth grows stronger, day by day;  
I hear the soul of man around me waking,  
Like a great sea, its frozen fetters breaking,  
And flinging up to heaven its sunlit spray,  
Tossing huge continents in scornful play  
And crushing them, with din of grinding thunder,  
That makes old emptinesses stare in wonder;  
The memory of a glory passed away  
Lingers in every heart, as, in the shell,  
Resounds the bygone freedom of the sea,  
And every hour new signs of promise tell,  
That the great soul shall once again be free,  
For high, and yet more high, the murmurs swell  
Of inward strife for truth and liberty.

—James Russell Lowell

of earth where the wisdom of the ages is recorded are found open, and such a seeker as H. P. Blavatsky is led to them by the light within. O, the glorious search for Wisdom that H. P. Blavatsky made! She gave her whole heart to it and the strength and enthusiasm of her pure young life. And she found the priceless truths of Theosophy, and in a world so full of the lust of gain for self, she gave again what she had found, without asking anything in return. Never did she accept any money for her teachings.

H. P. Blavatsky knew that people could not learn to live Brotherhood until they had nobler ideas of life. They had to get into their inner picture-world a higher ideal of life before they would try to live it. They had to study Theosophy. So she wrote books for them to study,

and taught all who came to her. People were very much puzzled at that time about what human beings are, who created them, what is their part in the great universe. In fact many people are puzzled yet—those who have not studied Theosophy. But in H. P. Blavatsky's books anyone can learn the truth about these most important matters, and he will find the truth most inspiring, for man has a great part to play. The best thing about Theosophy is that it explains everything that people are puzzled about, and leaves them free to go to work without losing any more time in wondering about why they are here, and what they ought to do, and what is to become of them after their bodies are dead.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY was founded by H. P. Blavatsky to form a nucleus, a beginning of the Brotherhood life on earth. In her writings she teaches that at the heart of every religion there is one Truth, just as all beings are rays of the great Soul of the World. Of course if people believe this they do not persecute one another or become intolerant of what others believe—and so they can work together. And in THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY they do work together. H. P.

Blavatsky taught all her students that they must live Theosophy: they must "live to benefit mankind," and people who really try to do this find out what unity means.

Something very beautiful and helpful has come from the efforts made by H. P. Blavatsky. She showed her students how to live for others, and when she was gone, William Q. Judge went on teaching them, and they kept trying, and then Katherine Tingley came and showed them how to help the children, how to apply Theosophy to the needs of the children. It will be so much easier for the young, who have not had any wrong ideas first, to learn to make the great truths of Theosophy the keystone of their lives. They will learn these noble ideals from the first; they will never know the sadness, the despair of the older people who did not learn the truth so early; they will become strong helpers and will carry these truths all over the world. All the hidden sweetness and power in the human heart will blossom in the sunlight of Truth.

That this might be H. P. Blavatsky bore slander and venomous attacks from the enemies of her great work for humanity. Never did she waver. The pure young life that was ready for the high Quest for Wisdom grew into a dauntless, godlike womanhood with power to guide and guard humanity—an ideal to cherish and renew with reverent thoughts on every White Lotus Day. STUDENT

# THE CHILDREN'S HOUR

## *The Princess of the White Lotus*

ONCE upon a time, in a land between the rising and the setting sun, there stood a castle on a high hill surrounded by a beautiful forest. In the midst of the forest was a lake in whose placid depths there grew a solitary lotus plant. One morning in mid-summer just as the sun's rays rippled the mirror-like surface, a beautiful White Lotus flower slowly unfolded its great snowy white petals. The fairies and water-sprites who had been guarding it from harm ever since it first appeared, a small bud, above the water, were hovering near. Imagine their surprise and joy when they saw cradled in the golden heart of the White Lotus a beautiful baby with wide open starry eyes. Around her neck on a chain of tiny golden links hung a large opal, glowing with many colors like a lovely drop of dew on a rose petal. Some of the fairies flew away to announce the wonderful news to the fairy King and Queen who haunted a dell close by. They at once ordered that the child should be brought before them.

As soon as they saw her, they knew her for a Princess, one who belonged to the most powerful kingly race of all the world. They recognized the opal, which had a secret sign engraved in gold upon it, as the royal talisman. So the fairy King and Queen ordered a great festival and amid such rejoicing as was never known before in fairyland the Queen placed a wreath of flowers upon the head of the baby Princess, and the King touched her eyes, her ears, and her heart with his magic wand, in token of the protection of the fairies. Then they named the little Princess of the White Lotus, Helen, or Child of Light, because of the rainbow talisman that she brought with her. After the ceremony a bevy of fays caught up the White Lotus cradle and amid a burst of elfin music she was borne away to the castle hard by, and gently laid down just inside the sunniest window. For Princess Helen was a human child and the good fairies wished her to inherit her rightful kingdom.

As she grew up little Princess Helen lived in a fairy world. She could see and hear fairies everywhere, wearing starry crowns and rainbow robes, with lovely butterfly wings, and singing and dancing all the while they were weaving and weaving the magic robe of beauty that they spread over the whole world. At night when she looked up at the golden stars the little Princess could hear their beautiful music as they went marching through the sky. Indeed all the world was alive to Princess Helen, flashing with beautiful colors and singing joyously. How she loved it! Even the animals conversed with her in their own language, the wildest growing gentle under her magic touch.

One thing only puzzled little Princess Helen. Why were not all the people that she saw in the world as happy as the fairies? There were so many unhappy, hungry, even unkind and cross people in the world! And she soon learned that very, very few people,

indeed, only tiny children, could see the fairies. Why was all this? One sad day she found out. With her clear star-blue eyes she saw that a wicked sorcerer had thrown an evil enchantment, like a gray veil, over the people of the world, so that they were really half asleep all the time. No wonder they thought that the world was dead, and that each person on it was separated from every other as if marooned on a desert island!

How to lift this enchantment was now the one thought by day and night of the little Princess Helen. "I will go to the fairy King and Queen," she at last decided, "and ask them if they know a way, for the fairies are happy all the time."

So away she ran to the fairy dell where the King was sitting on his throne and she said to him, "O King, will you tell to me the secret of the happiness of the fairies? I want to help my people, so that they too may be happy."

"Why, I just wave my magic wand and the fairies do my bidding, that is all!" answered the fairy King in surprise. Then the wise little Princess thought, "If I had a magic wand, I would wave it and break the wicked sorcerer's enchantment and release my people from his power." So she said aloud, all her heart shining out of her sweet earnest eyes, "O good Fairy King, will you tell me who gave you your magic wand? By the light of the shining opal on the golden chain, I entreat you to tell me this great secret!" and she held up before him the royal talisman that now glowed with the seven colors of the rainbow. Then the fairy King looked deep in her heart and saw that it was as pure and clear as a dewdrop on a white lotus, so he said, "My child, it was the gift of the great White Magician who lives in the Morning Star."

"I will find the way to the Morning Star," said Princess Helen, and she made a deep courtesy and departed. That very day she set out upon her quest. The way was very long and hard, for, as she wished to reach the stars, she had to climb and climb all the time, from mountain peak to mountain peak. Often at night, when she reached a great height, footsore and weary, she found that her fairy friends had prepared a couch for her and placed refreshments close at hand. In the morning when she awoke, on the ground lay the weapons she needed for the day. Once it was a keen-edged lance, and that day she vanquished a giant that stood in her path. Another day it was a golden helmet, and it protected her against a poisoned arrow aimed by the sorcerer at her head. Gradually, as she climbed, Princess Helen found herself clothed in a complete suit of armor that she had gained piece by piece. Only the sword was missing. At last she came to the highest mountain peak, and there she found a beautiful white-winged horse awaiting her. She caught hold of his silken mane, leaped lightly on his back, and as quick as a flash he arose

on his broad wings and, guided by her hand, flew up, up, up to the Morning Star.

The great White Magician knew Princess Helen at once. This was the Maiden Warrior, clothed from head to foot in golden armor, whose coming he had long awaited. Not only did he entrust her with his magic wand, but he gave her besides, a distaff mounted with gossamer strands, and a golden shuttle. Then he said: "By virtue of the royal talisman over your heart, I now give to you this Sword saved for the day of your coming." Then he knighted Princess Helen and she departed on her perilous journey, back to the world of men to release them from the spell of the evil enchanter.

At every turn there were fierce dragons to meet, fortresses held by giants to storm, and poisonous birds of prey to shoot with her arrows; for you may be sure that the sorcerer had all his outposts well guarded. But Princess Helen was a match for them. Single handed and alone she vanquished them all. Then passed all around the world, spinning, spinning as she went her gossamer strands into fairy thread; touching the hearts of men with her magic wand; and with her golden shuttle weaving, weaving, all the time, a spell that should be stronger than the spell of the mighty sorcerer.

Wherever his power was greatest, there appeared Princess Helen, sometimes as a great lady in satin gowns and flashing jewels, touching all hearts with her charm; then as a poor woman with head shawl and work-stained hands, living and suffering with the poor and humble; again as a soldier on the battlefield, fighting for liberty and justice, or nursing the sick and wounded. But under all the disguises, she wore her golden armor, and the invincible sword hanging by her side.

Everywhere the magic of her presence was felt. Indeed she encircled the earth with magic, casting her magic threads from heart to heart and from land to land. The veil began to lift from the eyes of the people; they saw the living world as Princess Helen had always seen it. Their hearts throbbed with joy because of the gossamer thread that she had flung from heart to heart and from land to land. And they put their hearts and hands and heads together to strengthen these threads into visible bonds that the wicked sorcerer could not break. As he lost his power they discovered more and more secrets of the fairy world, and at last learned the secret of the fairies, the magic of helping and sharing as they did, and obeying the Magic Wand.

Then Princess Helen wrote down in great golden books all that she had learned in the Morning Star and gave them to the people as a precious heritage. She gave the Sword to one who stood ready to use it; in his hand she placed the Royal Talisman. Then into the window flew a bevy of fays bearing a great White Lotus. Princess Helen sank on its golden heart. The snowy petals folded about her, and she fell asleep. STUDENT

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis

Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

### Unprotective Mimicry

ally to the conclusion that the undoubted cases are fewer than are usually reckoned.

A true case of protective mimicry is a mimicry that protects. It may be mimicry of something worthless, something disregarded by every other living thing; for example, of a dead leaf. Or it may be a mimicry, by a harmless creature, of a creature with much power of defense or attack. *Mere resemblance*, however close, may be called mimicry, but not *protective* mimicry. If, for example, a moth mimicked a wasp, it would hardly be protective. For the night-flying creatures which eat moths know very little about the day-flying wasp and would probably unhesitatingly try to eat one if he were incautious enough to study the stars at midnight. A butterfly which resembled a wasp would certainly help himself; but not if he mimicked a marked species of wasp whose home was five thousand miles away. Some of the cases of mimicry are of this kind; and, whatever their explanation, they are clearly not in the

Genuine  
Adaptation  
Implies a  
Consciousness

least protective.

The number of real cases is further diminished by the fact that the senses of insects and birds are not quite like ours, often very much acuter. What may appear to us a perfect resemblance in form and color must often appear to them no resemblance at all and therefore be not in the least protective.

We therefore put aside resemblances of creatures that live a long way apart; most of those between day and night creatures; those that only appear so to us; and resemblances that are useless, however perfect.

This last class is large and interesting. It includes resemblances by one creature, of another which has as little, or less means of defense, and which are, if anything, slightly prejudicial. It includes resemblances of creatures which hardly, if at all, expose themselves to sight.

Other Cases  
of Simple  
Imagery

As an example of a meaningless resemblance let us first refer to the Taira-crab, a *Dorippe*, Fig. 1. [the Professor gives photographs which perfectly illustrate his remarks] on whose back a human face appears strikingly portrayed. This crab occurs rather abundantly in a region of the Japanese coast where many centuries ago a great naval battle took place; and

it was only after this time, local Buddhistic tradition states, that a face of a Taira warrior appeared on each carapace, as tangible evidence that the souls of the dead migrated into the bodies of these lower animals! Now, the resemblance is developed to an almost uncanny degree; the face, first of all, is clearly oriental—even more Chinese or Korean in type than the modern Japanese, but from this very fact the more singular, since at that time but few Ainos had been absorbed into the Japanese race, and its physical features were therefore, on historical evidence, more strongly continental. The face, in the second place, is that of a drowned man; it is horribly infiltrated, the nose swollen and the mouth widely opened. In such a case the complicated nature of the meaningless resemblance can hardly be over-estimated. For we have in it, as will be seen, a series of resemblances which are added one to the other, from the general to the specific, in somewhat the following way: human face (in itself, of course, a very complicated structure): male: young: Oriental: primitive Japanese: drowned.

A Remarkable  
Complicated  
Resemblance

Other similar cases are given. There was a whale's "carbone," found on a beach in Norway. "It portrays in half relief a Scandinavian face of low caste, and with almost absurd accuracy." There was the skull of a goat, picked up in Agra, "which shows on its supra-occiput the face of the common monkey of the locality, the Hanuman."

Another possible case is that of the squash seeds, which in drying acquire irregular depressions on their surface, and thus produce the effect of ideographs. They are said to have come originally from Japan, but in any event so perfect are the "characters" that I have known a Japanese scholar to puzzle over them for several minutes in his effort to read them!

There is a fish "which is said to have appeared in Yedo (Tokyo) shortly after the last dynasty of regents made their seat there." This fish bears the three Asarum leaves conjoined, the badge of the Tokugawa family.

There is a chrysalis, that of the butterfly *Feniseca Tarquinus*,

which pictures a human face almost as strikingly as in the Taira crab. For here the resemblance is developed in remarkable detail . . . all in this case as palpably Caucasian as the Taira face was proto-Japanese. If the present photograph had been taken from a larial mask of Tarquin himself, it could hardly appear more human.

The Professor's article gives some further cases unnecessary to quote. But they are naturally left without any hypothesis of explanation.

Theosophy teaches that whatever is or happens on earth pictures itself relatively per-

Other  
Instances

manently on the astral light and mirror: and that whatever is there as form tends to reappear on earth in matter. (It contains also

Physical  
Imprints of  
Epidemic  
Thought-Forms

prototypal forms that have not yet appeared on earth). Every time a drop of water crystallizes in ice on the window pane, it is the manifestation of an astral (geometrical) form, waiting embodiment in the visible world. One kind of memory is really a seeing of records on the astral screen, the brain cells being the keys. Ancestral resemblances have their roots in the astral light. Pictures in the mind of the mother, operating on the unborn child, are really in the astral light.

Under the same explanation come the cases cited by the Professor. Plastic egg matter has taken some neighboring astral impress. Nor does it seem strange that common astral prototypes should occasionally impress themselves upon unrelated insects in remote parts of the world, and cause the occasional resemblances of insects to flowers—resemblances in no way protective. STUDENT

### No Supreme "Faculty" of Learning

A RECENT writer speaks of the lack of unity in college studies and the absence of common ground between the various Faculties. The professor of biology cannot meet the professor of Greek understandingly, even within the limits of a comprehension of the Greek roots in his technical vocabulary. The professor of mathematics must avoid formulas and theorems beyond the simplest, or he will floor half the young professors and instructors in every science but physics. It is never certain that the professor of French can address a sentence of three words in that language to the professor of German and a professor of Latin is driven to outside help by a Greek quotation. And he goes on to speak of over-specialization, which may mark the distinction between wisdom and knowledge, and which, however useful to the specialist, perplexes other people so that they cannot see the forest on account of the trees.

Another point is that the members of these various Faculties, in their intercourse with each other, frequently cannot exchange ideas on subjects of common interest and serious importance.

Every one knows the intellectual barrenness and uninteresting character of some classical scholars or mathematical geniuses, and the boredom of conversing with one whose ideas revolve around some single branch of technical knowledge. Such people are superficially and partially educated, if the word education can be applied to them at all.

We have a wrong way of regarding knowledge. Instead of all these studies being regarded as branches of one great Knowledge, knowledge is regarded as being the synthesis of them. But this synthesis is not concrete; it is an abstraction, a general term for a collection of fragments which do not form one whole. The great central or parent Faculty is non-existent. In other matters besides college studies our present civilization shows the same invertebrateness, the same lack of a central co-ordinating power. Thus one might extend the scope of one's criticism and point to Faculties in the world at large: such as the Faculty of religion, the Faculty of science,

the Faculty of politics, the Faculty of economics, and so on—all without a co-ordinating center or parent source.

The fragments of pre-existing central institutions may perhaps be traced. We have in many countries the sovereign who represents at least the show or principle of central control, and there are traditions that he once possessed a "divine right" that rested on more than mere claim. Connected with the sovereign are the various councils and executive bodies surrounding him. But we do not now find that the sovereign or his councils claim any special knowledge. For special knowledge we have to look elsewhere; it has become detached from government and has floated away. We have, for instance, a mysterious and very ancient institution called Masonry...

The Faculty of religion claims special knowledge and power apart from that of the government; and this Faculty is again subdivided into many minor Faculties. The Faculty of science claims to provide still another kind of knowledge for our guidance.

This is surely chaos. Human affairs are actually ruled by no single one of all these Faculties, but by an innate human sense which acts, though it has no organized representative now among us.

Is it possible to conceive of a supreme FACULTY endowed with a wisdom and knowledge that would place it indisputably at the head of all affairs, religious, social, educational, scientific? What would the members of this Faculty be like? Would they be simply men of extraordinary learning who had climbed successively all the different ladders of learning and become walking encyclopaedias or Admirable Crichtons? Or would they not rather be men who had climbed (inwardly) by one mountain path to a summit from which they could view the fields of knowledge spread out before them?

We have nowadays the hereditary monarch and the elected representative or administrator; but they do not differ markedly from ordinary men. They have no *knowledge*, in the sense above outlined, no indisputable "divine right." But it may not always have been so in the world's history; there may have been times when there existed a KNOWLEDGE, a supreme Faculty, and men endowed with wisdom to direct and rule in accordance with its sanctions. STUDENT

### The "Primitive Origin" of Handshaking!

PRIMITIVE man... whose reason for shaking hands was to ward off a possible assault.

This sentence occurs casually in an article on politeness. One has not gone into the question of the origin of handshaking; but until indisputable evidence of the truth of the above opinion is forthcoming, one will consider it as merely a conjecture on a par with many other such conjectures. One will, however, admit the possibility that the ceremony, though not thus founded, may have been thus abused.

To begin with, gestures are the spontaneous actual expression of feelings; not studied out, but made instinctively in accordance with a vital-mechanical law of our constitution. Fear causes the *linga sarira* or model body to shrink and quiver, the effects being communicated to the physical body. Anger produces heat and spasmodic motion: pride stiffens, and so on.

Manual gestures are of the same order, especially those used in conversation. There is not a motion of the body but has some significance, either as an effect or as an inducer of some emotional or mental state. A knowledge of this fact lies at the root of ceremonial postures, ancient ceremonial dancing, etc.

Next, the grasping of right hands puts the two participants into a close vital relation with one another; so that a pledge or obligation undertaken under these circumstances can be regarded as mutual. If it were possible for two persons so to unite themselves that their minds would become as one, deception would be impossible. A cordial sincere handclasp is a step in this direction, and meant much more to people who were more "primitive" than it does to those who are more "cultivated." One may compare this custom with that of the mutual transfusion of blood, or "blood-covenant," disgusting as it is, performed between two people who wish to undertake a mutual pledge. The idea is the same—to effect a brotherly union.

And more than this, it was believed, on good grounds, that a pledge undertaken under such conditions was more binding, partly because harder to break, and partly because its infraction would be disastrous to the infringer. The blood covenant or its equivalent produced an actual *rapport* between the participants, of such a nature that one could not think ill of the other without coming into conflict with the mind of that other. We do not now perhaps pay much attention this kind of *rapport*, for we live in personal shells (which are indeed in most cases necessary for our protection against each other in this age). But in a sincere and "primitive" society where people were not so afraid of each other, the case would be different.

There is a tendency nowadays for the handshake to be shirked; one reads that it is becoming fashionable to omit it altogether, or to reduce it to a mere pawing in the air. What does this mean but that we realize its importance and shirk it? A handclasp does commit us to something even yet; not lightly can we undertake it.

As just said, it is perhaps as well that indiscriminate handshaking, like indiscriminate kissing, be not indulged in too much. It does set up a *rapport*, and we ought to be more particular about it than about morbid infection. We cannot afford to contact every nature we may chance to meet. But when such is the state of mutual relationships in our civilized society, does it beseech us to prate about the alleged mistrust of "primitive man"? Even if he did shake hands to guard against an assault (which is not admitted) still he recognized the ceremony as a safeguard, which is more than we can say of ourselves. That is, if he was like *Punch's* idea of him, a hairy savage with just enough intelligence to cope with dinosaurs and megatheriums. Nothing could be further from a description of man as he was in Atlantean times.

Finally, as the theory evidently is that handshaking in general has been derived from this supposed savage custom, one would like to ask whether kissing, embracing, and other signs of affection and the desire for close union, are also derived from similar savage precautions; and if not, from what "primitive" savage instinct are they derived? T.

# Some Views on XXth Century Problems

## The Cow in the Temple

**M**YSTICISM was once defined as the yearning of the soul to go out towards the infinite. The man in the street mistakenly believed that such yearnings were very difficult to attain and led to nothing. So he was accordingly inclined to leave the whole subject alone.

He can take it up now. He can learn that it can be made to yield cash results. With soothing and elevated sentences, redolent of the highest and newest culture, he can induce the cow of plenty to yield him all the golden milk he can even imagine. The "Infinite" will smile upon him as one of its dearest devotees.

When the coiner sends out his circular offering to supply you any number of dollars for fifty cents each, he usually accompanies it with a conscience soother:—Society is askew; the rich man preys on the poor; the worker does not get his work's value; your purchase of the false coin is really rather a meritorious act, helping to correct some of these injustices, to restore to you your God-ordained but man-denied rights—and so on.

The New Mysticism does the same. Before its appeal to the basest human instincts it inserts gushy preambles in the New Thought key.

First comes some talk about man's identity with the "Infinite." Then follow instructions how to realize this identity. Then instructions what to do when you *have* realized it. To quote from a recent book enjoying considerable sale among the gullible:

Just rise into the realm I AM, and by imagination and affirmation pump yourself full of I AM power. I AM wisdom (!!) I AM love. I AM whatever I desire to be. ALL things work together for the manifestation of what I AM.

This is the philosophical part. Then follow some practical instructions mostly concerned with breathing, precisely calculated as physiological tricks to destroy health, and as psychological tricks to induce hypnotism and rapidly destroy all power to concentrate and use the mind:

Inhale slowly, but not too slowly; just easily; as you inhale, say mentally, with eyes raised under your closed lids, I AM—say it slowly and distinctly, and try quietly to *realize* that the Infinite is really you. . . . This same exercise, used with the words "I AM money," is the finest treatment for opulence.

He means for the obtaining of opulence. Here is another extract from the same book:

All life is growth, and a live Ideal is no exception. Let it grow. Stretch your imagination to take in all you can. When you find yourself approaching the \$5000 a-year mark you have set for yourself, you will find yourself wanting \$10,000. Now don't accuse yourself of never being satisfied. Just rejoice in this evidence of spiritual growth, (!!) and go in to win on a larger scale.

It will never occur to the book's readers to ask *what the writer's income is*, and why, since Infinite Cash is open to him, he needs to write and sell it at all. Perhaps for pure

love of mankind! But why then does he not *give* it away? The miserable dollar cannot be an object to a man who has access to the Infinite Cashbox.

"My way is easy," said a real Teacher, and he spoke truth. This other way that seems so simple leads only to mental and spiritual sterility, to lost health, lost sanity. The *real* "Infinite" is reached through no directer path than all humanity, the path of a compassion which spreads through ever-widening circles, the path that is trodden by the man who sets out from that center where he feels his compassion to arise and glow. The center of compassion, and so much of mind as has accepted its light and learned to work thereby, alone are immortal. They alone can reach the Infinite. The rest, let it have made what assertions, affirmations, denials, and performed what breathings and psychic chicanery it will, is finally impotent and mortal. The choice is free.

## Mental Hygiene

**M**ENTAL hygiene, the practices necessary to ensure mental health, consists of laws very comparable to those of bodily health. In both cases the program is threefold.

In some minds, very vigorous ones, during the middle and most active years of mental life, the learning of new things is very irksome; but not because of mental stiffness and implasticity. In these minds the tendency, the urge, is to think actively, to draw thought out of themselves, to create. But to study, to learn, is to submit to an imprint; in some measure it is to stop thinking and be thought upon. These people often say they cannot "sit down and learn." If they are readers, they think four thoughts for one that they read and the four are often antagonistic to the one.

In the earlier years, those of childhood and youth, the mind wants to follow the play of body, and for *that* (a very different) reason, objects to learning and may also be unable to do any real thinking. Nevertheless during those years the molding, the learning of matters is the pre-eminent necessity for the future conduct of practical life. Real creative thinking should of course be encouraged to the utmost; but pre-eminently the acquirement of data for future thought and work must be the great task.

In the middle and active years the creative thinking takes first place; whilst the acquirement of new book data, languages, science and so forth, takes the second—but should not take *no!*—place.

The acquirement of the data for thought and work, and active thought itself as an exercise, are neither of them properly the acquisition of the *vitality* of thought—no more than is the acquirement of a physical technique, or the exercise of it, precisely the acquirement of the physical energy by which it is done. Body requires *food* to back up all it does.

So does mind: in which sense no books

and no facts are food. As body must go beyond itself for food, must go to its source—living nature: so must mind. But *its* source is the profounder, richer consciousness of soul. The necessary daily *real* mind-feeding is the recourse to the diviner light, the indwelling Christos. Prayer and meditation have been defined as spiritualized silence, and in that consists the taking of food by mind.

While we consider the feeding or spiritualization of mind, its creative exercise in mental work, and its learning of data, as three distinct processes, allotting one more especially to one period, one to another, yet an ideal conduct of life gives each of the three its due place in each period. Children as well as adults can know that they are souls and can learn the value of their little moments of silence in drawing upon their higher resources.

If people in the middle period of life find that they require the book of a thinker to make them think, let them take it. But let them be sure that they use it rather to encourage their own thinking than to mold them to its.

Similarly the reading of a devotional book is not in itself devotion. It may be merely sentimental passivity. But it may serve as a needed aid to the spiritual and imaginative *effort* that should follow and accompany. Merely to *read* the book is no more than merely to sit down to a table in lieu of positive eating.

Our minds only become rigid, senile, incapable, because we do not follow this threefold path. We live life-dry, starved. We think that exercise of the mind, or making it read, are giving it food.

## The Two Poles of Chivalry

**T**HE Women's Suffrage Movement is more closely linked with the question of chivalry than most women participants imagine. If chivalry involved a duty and a special attitude on one side, so it did on the other. If man was to take his inspiration to deeds from the purity of the atmosphere around woman, *it was the duty of woman to make the atmosphere*. Joan of Arc could not make the man do the deed for the time, it was not in him. So she exceptionally took the sword and furnished both deed and atmosphere.

Some of the schools of thought of today make the woman but a slightly differentiated man; or *vice versa*. Others draw the line deep and say that by *woman* the world must be saved. It must—and also by man. But each element must "save" the other by becoming fully itself. It is the woman's raised and lived ideal of intensified womanhood that will awaken manhood and the deed-doer in the man. And it is the man's raised and lived ideals of manly action that will awaken womanhood in the woman. Then they will learn their inter-relation and interaction, and understand what chivalry was in its highest and what sex really means in the world. *Some people cannot distinguish sex from sexuality.* C.

BUDDHIST MONASTERY — CEYLON

**B**UDDHISM is a much older religion than Christianity, and numbers more adherents. The last Buddha died in 543 B.C. This Buddha was Gautama, that latest of a series of World-Saviors who appear at long intervals to lead men back to the "Good Law" and the ways of Light. When Gautama S'akyamuni came, the ancient Aryan Hindûism, child of the still more ancient Lemuro-Atlantean Wisdom, had been greatly perverted and its teachers were discouraged and often incompetent. This Messiah therefore came to teach anew the great eternal Divine Law, the Heart-Doctrine, Com-

passion, without which there can be neither wisdom nor welfare for mankind. Like Jesus, he had his esoteric teachings, given only to his pledged disciples, in which he rectified the errors of the day. In his public teachings he insisted chiefly on the cardinal doctrine of Compassion and, though his esoteric teachings have been lost to the public during the dark ages, that central doctrine has continued to be the light of many millions of Eastern humanity notwithstanding the sects into which Buddhism, like other religions, has become divided.

H. P. Blavatsky used both Buddhism and Hindû-

ism as channels for familiarizing the Western world with the teachings of the ancient Wisdom-Religion. For one thing, it was necessary to give Christians a side-light into some religion other than their own; for another, the pure unsectarian Buddhism is, in certain respects, nearer to the original teachings than most other religions.

There are many relics of the great days of Buddhist architecture in India and neighboring countries; but there are also many far more ancient monuments, cave-temples, etc., wrongly attributed to Buddhism by archaeologists.

# ✧ The Trend of Twentieth Century Science ✧

## The Psychology of Narcotics

AN article in a popular contemporary monthly, by an eminent medical authority who makes the nervous system his speciality, tries to explain to the public the action of narcotic drugs. There is quite a philosophic analysis of human nature which might have been extracted from a Theosophic manual. Brain, mind, and self are given their true relations. But then follows the extraordinary contention that the narcotics — morphine, cocaine, hashish and some others — do not affect the first or second member of the trinity, but the third, the purely immaterial!

The brain, says the writer, does not itself think any more than a violin itself makes music, or a pen the thoughts it records. It is the *instrument* of thought or rather of the thinker. "No instrument ever does anything itself, however used." Brain is the instrument of the independent mind.

But the mind itself is guided as to what it shall do in or with the brain, by the Self — which the doctor mistakenly identifies with the will. "The real Self in us is as far superior to the mind as mind is superior to the brain."

All this goes very well. But now comes the rest of the contention, "that drugs no more affect the brain than insanity itself does — that is, not at all!"

The reader is referred to a published investigation of eight brains made by an English anatomist. Six of these were brains of lunatics. The anatomist remarks:

that he was convinced from a lengthy experience in the pathological laboratory attached to the Rainhill Asylum, that in such lunatics all the microscopic methods at our disposal will fail to disclose changes, either in the nerve cells or fibers, which we can refer to their altered mental condition.

From this unproved assumption "that insanity neither affects nor deranges the brain structurally" both the anatomist and the writer of the article advance to the inference that drugs do not.

Neither, thinks the latter, do drugs affect the *mind*; for it can often reason clearly, talk brilliantly, and thoroughly comprehend the injury being done by the habit it is powerless to stop. It follows therefore that it is the Self alone, the Will, which is poisoned or "dethroned" by drugs.

Confusions run all through the argument. Will is not identical with the Self; it should be the Self's working agent. But man permits will to be seized and used by any strong desire, which thus sets in motion the necessary means for its own gratification.

The drugs do not dethrone or divorce the Self or affect it in any way. They carry mind, desire, and body, further and further from the Self's control. The Self is self-conscious spirit. The drugs are material, and their action — which is on the brain and nervous system — thus indirectly but effectively includes the mind, clouding it, pulling it down below the reach of the watching Self, that is, blotting out in it true *self*-consciousness. Once out of reach of the Self, it is entirely the

slave of desire and of the nervous condition. It can perceive the degradation, but, once divorced from Self, it cannot get at the will. The personal will is now wholly in the hands of the desire. In the ideally opposite condition it is wholly "offered up" to the spiritual Self.

Mind is not, however, directly affected by the drugs. As a thinker, it *may* not be affected at all; it may see the whole situation quite clearly. But it *may* be so affected by the intensity of the desire as actually to produce arguments — sometimes very subtle ones — in favor of drug-taking.

That the microscope and scalpel reveal no nerve changes in insanity and the drug habit, proves nothing except that they are not fine enough instruments. The telescope would show nothing if helium or any of a dozen other elements disappeared from the photosphere of the sun. It is not the right instrument for that; the spectroscope is necessary. We have not yet anything corresponding with which to investigate subtle nerve changes.

The body has a consciousness of its own and a natural desire for the feeling of well-being. Narcotic drugs gratify this desire in a peculiarly subtle and complete manner; and they do it by a physico-chemical action. When the sensuous action of the drug is over in a few hours, the physical uneasiness or even pain that remains from the poisoning, irritates the normal desire for the sense of well-being to an extreme point. Another dose is taken and the program goes on. The result soon is that this fed and ever stimulated desire grows out of any normal proportion, becomes a conscious entity on its own account, dominates or replaces all other desires, and reduces the poor body to a mere instrument for its own gratification. The instrument naturally has now but a few ever increasingly miserable years before it. But the desire grows always and even makes for itself an etheric body in which it continues to exist after the physical body is dead — a very evil presence in the astral world, now impelled to try to gratify itself by means of the organisms of living persons *who are just beginning to flirt with narcotics*. Such is the teaching of Theosophy, and it is an explanation of the occasional fate of mediums and the occasional sudden lapse of certain weak natures into the full narcotic habit. They had been opening the door a little way "just to see how it felt." M. R. C. S.

## Germ from Moon and Sun

HOW is the earth supported in space? It rests on the shoulders of Atlas. The answer is perfectly satisfactory until, in some illuminated moment, it occurs to you that Atlas himself requires some support. On being assured that he stands on the back of a tortoise, all doubts and speculations are resolved in pleasing finality.

Where does or did life come from? Whence the original life germs on our planet? Nearly a century ago an astronomer suggested that they got here somehow from the moon — which may not have been a bad guess, for

the moon, science notwithstanding, is older than the earth, and her parent. But he went no further and never speculated how they got on the moon.

The question will not sleep, and now there are two answers of which both may in principle be right. One is that life arose "spontaneously," by "spontaneous generation," an answer coming mainly now from Mr. Butler Burke and Dr. Charlton Bastian. The other is a reincarnation of the older answer, that life came here from the sun or an older planet. But this seems still to need the first one, for how came it into being on the sun?

The spontaneous generation hypothesis, as it stands, is as deadly a block to further mental action as that of special creation out of nothing. We had better go back of it and say that there is nothing in the universe, no atom and no sub-atom of whatever minuteness, that is not alive already. It is but our arbitrary system of terminology that calls them alive only when their livingness has reached a certain point. That which wakes them from the more negative or passive life to the active or positive, must be the vitalizing impact of the solar vibratory emanations.

But there is no objection, either, to the view that life germs traverse space. Those that have reached, on one globe, a certain level of evolution, may pass to another in another or younger condition, for their next steps; and may help or accelerate the evolution of some of those of which that younger one consists or is the home. This occurred from the moon to the earth, according to Theosophy, after the latter was born to separate life.

Light is now known to exert an outward pressure from its source. If an emitted particle from the sun be very small this outward push will be greater than the inward pull of gravitation. According to this law we are at every moment in receipt of a stream of negatively charged particles from the sun — in their way, life germs. Any kind of germ known to biology would be instantly destroyed by the solar heat, though not by any degree of cold — even the intense cold of interstellar space. From the sun therefore no such germ as is known to us can come. But when we remember that the germ is itself a compound of still lower units, and they of others back to and doubtless beyond the electron: and that, unless we blind ourselves with a wrong use of the words "spontaneous generation," all these are alive — the difficulty disappears.

In this view, "spontaneous generation" consists in the aggregation of lower living units to make higher ones, the aggregation permitting of differentiation of function, the appearance of the antecedents of what in higher forms are organs. And the finer become our instruments of research, the lower is the level at which we find these elementary organs. We are waiting upon the slowly perfecting instruments. It does not seem impossible that we may be receiving life germs from some one or all of the planets, notwithstanding their relatively low radiation pressure — even still from our neighbor the moon. ## Beech-Scale in Buckinghamshire

**B**UCKINGHAMSHIRE, England — noted for its famous "Burnham Beeches," and as a beech-growing county — is threatened with serious loss unless "beech-scale" is eradicated. The disease is detected by a white fluffy powder which forms first on the bark. Unless this pest is promptly dealt with, it is stated, nearly all the trees in the county may be destroyed, thus leaving barren many beautiful wooded slopes of the Chiltern Hills, and depriving the land of beeches (*buchen*) of all title to its name.

Everything is periodic, and one cannot expect beech-groves to be eternal more than other things. Perhaps, when their life-cycle comes to an end, the waning vitality hands them over a prey to invading parasites; perhaps an undue corruption of the vital atmosphere of Nature hastens an untimely decay. But these epidemics—the scales in plants, the diseases in live-stock, the influenza in man—are becoming serious menaces to our prosperity, and stand as continual adverse comments on our mastery of the science of life.

Nature is long-suffering and restores to man the health he has abused; yet in time even her store of health may become exhausted and she may succumb to adverse influences from prolonged abuse of the laws of health. The insect causing the scale is alive and intelligent, but modern science is unable to tell us whence comes its *being*. What ensouls this organism?

Man, by his thoughts and emotions, is the creator of psychic entities which find their organic expression in such devouring creatures. The ancients recognized the interdependence of moral health in man and physical health in Nature; but they did not regard this as regulated by the decisions of a punishing and rewarding Creator; they saw in it the working of natural law. And what we regard as their "propitiating of gods" was, in its origin at least, a ceremonial by which they sought to undo by good thoughts the harm caused by evil thoughts. STUDENT

## The "Eagle" Owl

**T**HIS bold majestic bird is classed among that genus of the family of Owls distinguished by the appellation "Eared," though in reality the so-called "ear-tufts" on the head have no connexion with the sense of hearing; for the ears of owls, like those of every other bird, are situated just behind the eye. From his appearance one would judge him to be larger than the golden eagle, but his illusive size is due to fluffy and outstanding plumage, for he turns the scale at just a quarter of the eagle's weight.

His color scheme is striking and harmoni-

THE "EAGLE OWL,"

## GOD IS LAW

Tennyson

**T**HE sun, the moon, the stars, the seas, the hills and the plains—  
Are not these, O Soul, the Vision of Him who reigns?  
Speak to Him thou for He hears, and Spirit with Spirit can meet—  
Closer is He than breathing, and nearer than hands and feet.  
God is law, say the wise; O Soul, and let us rejoice,  
For if He thunder by law the thunder is yet His voice.  
And the ear of man cannot hear, and the eye of man cannot see;  
But if we could see and hear, this Vision—were it not He?

ous, consisting of dark bars of brown with speckles of deep black, upon a background of yellow-tinted brown. The powerful beak and talons look like ebony and the great eyeballs blaze with radiant orange as he fiercely glares upon you from his perch. Each feather has a fringe of downy filaments, so that the beating of his wings is muffled into perfect silence; and as he floats down the dim avenues of pines, his progress is as noiseless as a drifting cloud.

His range is quite extensive, for he may be met with in the Scandinavian forests and in Russia, and as far south as Italy and Turkey.

The eagle owl subsists on partridges and hares, and sometimes even fawns of stag and reindeer; and there are doubtless many of the lesser mammals roaming the woodlands in the night whose blood runs chill when the deep long-drawn "Boo-Boo" of this owl is echoed through the forest glades.

The eagle owl soon reconciles himself to life behind the bars and even rears his family of three gray, down-clad nestlings in his prison home; but captive owls must of necessity suffer many privations though their keepers do their best to be considerate and kind. The owner of a private zoological collection once

showed his pair of owls to a naturalist. The birds enjoyed an ample space for flight, food was abundant, perches were convenient, and the light not too intense, and yet the birds appeared dissatisfied. The visitor induced his host to shoot a load of sand into the aviary and in a trice the moping owls flew down with manifest delight, and, like two common barn door fowls, began to tumble and roll and fluff their feathers in the first sand bath they had had since they were committed to their cage. ## Anti-Vivisection in Paris

**T**HE Paris Anti-Vivisection Society numbers 15,000 members and has thirty deputies in Parliament. At a recent meeting it passed three resolutions: to make it a penal offense to steal dogs on public highways; to reorganize the Fourrière, or home for stray animals; and to suppress vivisection experiments in primary and secondary instruction.

When the question of vivisection in higher education was discussed, some doctors argued it could not be entirely dispensed with. If that be so, it is time the curriculum was reformed. Medicine teaches the use of nature, not its abuse.

Even though some devotees of these practices may be sincere in their devotion to science, it must be recognized that no cult, scientific or religious, has the right to assert its peculiar claims to the point of outraging people's general sense of what is right and fitting. France has evidently not thrown off a religious tyranny only to fall under the yoke of a scientific dogmatism claiming special privileges and exemptions in the names of mercy and enlightenment. E.

## Fire Protection in San Bernardino Reserve

**I**N the San Bernardino Forest Reserve the Forestry Service is constructing twenty-three miles of fire-breaks from Cajon Pass eastward to the Yucaipe Valley. A telephone line 45 miles long is also being laid to connect the rangers, and a number of settlers will be allowed to come on the line to help to protect.

## Cotton Growing in Nigeria

**N**IGERIA has prospects before it as a producer of cotton for export and manufacture abroad. The natives already grow cotton for their own spinning and weaving, and it is thought that a quality equal to American "middling" could be grown on a large scale for raw export. Though the state of the country will not yet allow of plantations managed by Europeans with native wage-labor, it would be feasible for capitalists to promote native plantations and set up local markets for the raw material. ## Purification

The world needs more impersonal men and women who will bend all their efforts to restore the divine ideals, so that out of the present disorder and unrest perfect order and peace shall result.

THESE are the words of Katherine Tingley, and turn where you will in the teachings of Madame Blavatsky you will find the same note struck, always this putting in its right place of the merely *personal* element in human life and character, the necessity of its subjection to the purer, higher elements of our nature, the true Ego, or the Divinity of man. For as Katherine Tingley truly points out the DIVINITY OF MAN is the key the loss of which has kept the larger fields of human progress a *terra incognita* to the majority of men. The *personal man* is not the divine man, the Immortal Being which is our true Self; the personal man is the *limited* state of consciousness that causes us to feel ourselves as separate selves and to be selfish, vain, sensual and ignorant, the part of our nature in which sorrow inheres, the feeling of loneliness and desolation. It is the everyday consciousness of the majority of us.

The Light of the Divine is thickly veiled in the personal consciousness, and man seeks satisfaction in material things, in what seems good to the eye, or the passing whim. But behind the *personal* consciousness which is inseparably connected with the animal consciousness, lies the *Individual*, the reincarnating Soul, and that is our *real Self*.

Thus, to attain true progress we should not *identify* ourselves with the personal consciousness, but try to realize that "the universe was evolved," man's personal nature included, "for the *Soul's* experience," and that we might learn the nature of material existence and turn it to good account; *not to allow the deceptions of the senses to turn us from our rightful place and purpose in the Divine plan*, but to stand to our Divinity and subdue the lower forces by the power of Spiritual Will, our rightful heritage as Sons of God. Earth life is the plane of action, we need to be "up and doing, with a heart for any fate."

Purity means the state of being unmixed, and purification, the act of separating from anything that is foreign to it. That gives us a hint of what our work is, does it not? In a sense we might describe purification as the Theosophic life, because it is the process—Theosophically speaking—by which man becomes the free spiritual Being he was before the reincarnating period began on Earth. It is the gradual withdrawing of interest and energy from the personal lower self and re-centering them upon the Central Heart which sustains all life; in short, the Divinity in Nature and Man.

Man must realize that he himself is a God, before he can say his purification is complete, but such a state takes lives to accomplish. We

are all in different stages of purification, and the more unselfish one is, the nearer he is to the goal. It is a state we need to work for daily, in the little things, and break the personality on the wheel of duty and self-sacrifice until life becomes a song, instead of a moan. Why? Because the personality, that thing of moods and desires, is the "giant weed" that drains the nourishment from the garden of the Heart, wherefrom spring the glorious blooms of virtue that make fragrant human life. Sympathy and Love, the true *brotherly* feeling, will lead us into the right path, the path whereon "Humanity" calls for all our energy and interest.

Thus in time our whole life will be consecrated to the service of our fellows, and purification a joyous effort to gain further enlightenment that we may better serve. E. I. W.

## The Value of Our Weaknesses

IT is generally held that knowledge of a man's weaknesses by his enemy is so much power in the hands of the latter, just as in time of war the knowledge of the weak places in a fortress gives power to the besieging forces. Granting all this, may not one's weaknesses be equally if not more valuable to the one who possesses them—not valuable in themselves, but in pointing out the steps that must be taken on the pathway of true progress?

Correctness of judgment is in exact proportion to the ideal and wisdom of the one judging, but when one comes into a knowledge of the fundamental doctrines of Theosophy he reaches a vantage point from which he can view with a clearer understanding the relative strength and weakness of his own character, and in degree, of those about him.

We know that as we conquer weakness strength is attained, and but a little thought will show that out of our weaknesses we may forge our greatest opportunities for growth and development.

In the realm of nature do we not see that all things representing strength and resisting power have been built up gradually, often through long ages, from fragile and infinitesimal forms of life? One may see a slender, pliable sapling struggle through tempest and heat into a firmly rooted, wide-spreading tree. Can the evolution of human character be any less than that of the so-called lower kingdoms? It takes many trees several generations of men to reach their highest perfection. Is it then reasonable to believe that three score years and ten is sufficient time to fit the human soul for eternity—perfection?

Theosophy's answer is that through aeons of incarnation man has been building, not only the body, but the character which distinguishes him individually and collectively. In the material world all progress is made through the overcoming of obstacles or limitations, and in the evolution of the human soul how else can its growth be accomplished?

Who is there that looking back over his present life, cannot cite many instances where, after perhaps many bitter experiences as the results of succumbing to weaknesses of character, the doorway of a deeper knowledge has opened, once there has been the heroic determination to rise above these weaknesses and conquer them? As is so beautifully said by Tennyson in *In Memoriam*:

I held it truth with him who sings  
To one clear harp in divers tones,  
That men may rise on stepping-stones  
Of their dead selves to higher things.

But Theosophy teaches that our weaknesses must be conquered in this life, that the mere change called death cannot free us from their power. Thus it is that we must come back to earth again and again until, rising step by step on the ladder of our sins and failings, we stand at last free on the heights. Once a weakness or a fault is truly overcome, thereby is gained power for all time; for, as said in an ancient writing, "slain tigers cannot turn and rend you."

The value of our weaknesses then lies in the lessons they provide for us and which we may learn through the endeavor to conquer and rise above them. We should learn, therefore, that not the smallest defect in our characters is to be despised; for, if it is neglected or if we seek to avoid or conceal it, its roots will grow and obtain such firm hold that to dislodge it may take all our powers and all our strength, our very life's blood. Surely we can learn from those weaknesses that already have cost us so dear to meet and extirpate the evil when we first sense it. If we have the determination to face it steadfastly and the will to rise above it there will come out of the struggle the strength of conquest that shall make for the upbuilding, not only of our own characters, but of the whole human race.

## The Theosophical Teaching Regarding Life

IT (the body) is like mother earth in that it is made up of an infinitesimal number of "lives." Each of these lives is a sensitive point. Not only are there microbes, bacilli and bacteria, but these are composed of others, and the others of still more minute lives. These lives are not the cells of the body, but make up the cells, keeping ever within the limits assigned by evolution to the cell. . . .

One of the mysteries of physical life is hidden among these "lives." Their action, forced forward by the Life Energy—called *Prāna* or *Jīva*—will explain active existence and physical death. They are divided into two classes, one the destroyers, the other the preservers, and these two war upon each other from birth until the destroyers win. In this struggle the Life Energy itself ends the contest because it is life that kills. This may seem heterodox, but in Theosophical philosophy it is held to be the fact. For, it is said, the infant lives because the combination of healthy organs is able to absorb the life all around it in space, and is put to sleep each day by the overpowering strength of the stream of life, since the preservers among the cells of the youthful body are not yet mastered by the other class. These processes of going to sleep and waking again are simply and solely the restoring of the equilibrium in sleep and the action produced by disturbing it when awake. It may be compared with the arc-electric light wherein the brilliant arc of light at the point of resistance is the symbol of the waking active man. So in sleep we are again absorbing and not resisting the Life Energy; when we wake we are throwing it off. But as it exists around us like an ocean in which we swim, our power to throw it off is necessarily limited. Just when we wake we are in equilibrium as to our organs and life; when we fall asleep we are yet more full of life than in the morning; it has exhausted us; it finally kills the body. Such a contest could not be waged forever, since the whole solar system's weight is pitted against the power to resist focussed in one small human frame.—William Q. Judge

## DAWN

THE Day breaks and once more  
We tread the Path of Life,  
Seeking always for we know not what  
And finding counterfeits of Pleasure and of Pain.  
Ruled by the pairs of Opposites,  
While with us walks Duty,  
A bright presence we stubbornly will not see.

Life is duty and duty is life,  
This the lesson we are here to learn,  
And until we set our feet upon the Path of Learning  
Life for us is but an aimless running to and fro  
An endless circle leading nowhere, the endless round  
Day by day, lashed by the whips of desire.

Look up, not down, for looking up  
We rise to higher things, while looking down,  
The contrary is true.  
Welcome Duty as our guide and teacher,  
Follow her as best we may, and the most high Gods,  
Will help us on.—J. H. Kummer

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** I have repeatedly heard it said that Theosophy is a message of hope to the discouraged. What more can it give than Christianity, which teaches that Christ is the savior of mankind?

**Answer** Now what is the meaning of this discouragement, and how shall we come at the very beginning and seed of it? I am discouraged, you say, the long record of my failings rises up against me and howls and clamors in my mind. This and that old act of mine shout and shout at me and give me no peace—this and that failure to act when action was needed. I was weak and I shall be again; I have tried and I continually fail; this engine of *me* will not run on the tracks; the rails will not keep it; it is incessantly astray here and there, over this embankment, crashing into that obstacle. Or perhaps—death will come to me, and how can I be assured of the afterworld; or I shall be found out, and how can I retain the respect of my fellows?

Or again: I must guard myself against poverty, or hunt for riches. I must get the better of this man, or outshine that one. *I must get what I want.* I—but what has become of the world, that it does not bow down and worship?

But the Universe and the great Law will not be treated so, to have one tiny cell of their being exalt itself and swell up into a kind of cancer. The knife shall be used on you presently, that is, the pain of discouragement will come. Whether you lose sleep by fretting over your personal store of sins, or by planning your advance and greatness, discouragement will come, for the Universe will not tolerate this insistence upon *I*. This is what the common order of discouragement means, that you have gone to the length of your tether with the Law, in heaping loads of consideration upon self. Your ego has outgrown the capacity of your cosmos. It is a poor thing, too; a center for all aches and fears and the source of them; whatever work you do for it, leads ultimately to discouragement, even if not until after years or lives.

Now, that "Christ was the savior of the world," is always interpreted, was *my* savior. This business of being saved has always to do

with oneself. When *I* am discouraged, sick with my million failures, it is mighty comforting to *ME* to know that *I* am still "saved." The cause of my discouragement was too much thought about *I*. Or, I failed to get the worldly things I desired, by this salvation I am to get heavenly things. Never lose sight of that capital *I*; see how it dances through the mind in search of salvation. What is the meaning of all this? A hair of the dog that bit you; the drunkard curing his headache with more whisky. Though you go contented to your dying day, ever so well assured of the safety of beloved *I*, the old discouragement must return some time, the stronger for all the complacency with which you have nourished its roots. Where shall we find the real cure? In Theosophy, which directs us to compassion and the service of mankind. Just leave that aching *I* where it is; drop it, and think about the needs of the world. Go and do some work that will be of general use. Turn your eyes off self, and do service. Then you shall forget altogether how discouragement stings and burns.

So much for that sort of discouragement, but there are other sorts, the afflictions of nobler souls. You have struggled so long to maintain your home, to protect your children from a drunken father or mother—Theosophy has infinite encouragement for *you*. The Law which apportioned you these difficulties, had knowledge of your utter need of them. This warfare is given you that you may gain from it the hero's strength for all time. For lack of this experience, perhaps, you were ineffective in a hundred lives. Remember those two grand teachings of Theosophy, Reincarnation and Karma, and measure the present life against the long ages of your past and future. It is not salvation that you need, but access to your own strength.

The world, heaven knows, is in an evil case, crowded and packed with sorrows and degradation. Christ came to save it, we are told—yes; but from our heart of hearts the cry goes out, How of the millions that are not saved? The drunkard who died in his drink, the woman of the streets to whom no light or hope came? They have gone to their own place and we cannot help them—but the long generations there are of them—the children that are born without any chance, and the millions more that are to be born. And the nations of the world going down from one generation to another with vice growing, the sins of the fathers multiplied in the children. Feel these things, see them and realize them, and the man shall insult you who tells you that the business of saving humanity was accomplished—nineteen hundred years ago.

It is a beautiful idea, this of the salvation of mankind through the incarnation of a divine being, and as true as it is beautiful. But we must not heap glamor around it until it has lost all its meaning. Salvation is an *actual* thing. It means the fallen choosing a better path, and gaining such insight and will, that that better path is followed. It means clean city government, pure, generous, and patriotic national life; also physical health, sound intellect, wholesome and vivid imagination. Have we attained these things? We have not, and the world is not yet saved.

But Theosophy shows that all down the ages divinity has been incarnating, not once,

but "whenever there was an insurrection of vice and injustice in the world," to guide humanity through the direst stages of its path. It is not that there has been one great Teacher or Savior, but a long line of them, and more and more shall come, and the world shall never be without its guides and shepherds. To be deserted for nineteen hundred years, and from now on until the end of time—the thought is rank with discouragement. And with all the human genius and thought that have been given to stemming the tide of evil, and so nearly in vain. What hope is there unless Theosophy is true, that there are new revelations and Teachers to come, and a divinity within man himself which only needs his conscious personal aid to lift him to its own invulnerable status?

STUDENT

**Answer II.** Go where we will today, we find everywhere men and women struggling under a load of discouragement—and these not confined to one class, but in all, rich and poor, cultured and ignorant. What is the cause, and what the remedy?

This condition has been fully recognized by our Teachers in the present Theosophical Movement, and it is in part to remedy this condition that they have come, and that Theosophy is once more being given to the world. The causes for this condition reach back into the very dawn of history and human development. It is one of the concomitant signs and results of the loss of man's heritage. It is the outgrowth, inevitable in the very nature of things, of man's losing the realization and the knowledge of his divinity as a soul, of his divine origin and destiny.

It needs no argument, no demonstration, that discouragement is impossible to him who realizes his divinity, who has a knowledge of his own nature, that that nature is dual, that it is possible by virtue of inherent divinity to control the lower by the higher.

As a contributory cause, due to the same lack of knowledge, unbrotherliness has become the rule of life, man set against his fellows, each one for himself. In the face of all this, in the face of conditions as they are in the world today, is it any wonder that men and women are discouraged? Is it not rather a wonder that humanity still struggles on. What explanation can there be save that there is deep down in man's heart unknown to him, and of which he is totally unconscious, a memory or a knowledge of divinity, so that in spite of himself he struggles on.

And the remedy? What remedy can there be save a revival of this knowledge, a reawakening to the consciousness of divinity? And it is a part of the mission of Theosophy to bring about this reawakening, to sound again the keynote of truth that it may re-echo in the hearts of men.

And then as a further hope, an additional remedy, Theosophy teaches, not as a theory, but as a logical certainty and as a corollary to the teaching of man's divinity, that he is immortal, and as a further logical necessity that he reincarnates and is reborn again and again on earth; that his smallest act, his feeblest aspiration cannot fail of its effect, that he must reap inevitably the harvest of that which he has sown.

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West.

## A Divinity Professor on the Failure of the Christian Gospel

**A**LIVE with thrilling interest is the subject of the "Bampton Lecture" for 1907, "The Reproach of the Gospel," by the Rev. James H. F. Peile. The quotations are from a review in the London *Spectator*.

"The influence of Christianity on mankind at large is, and has been, strangely disproportionate alike to its high claims and to the reasonable expectation of those who saw its beginnings." What is the cause and what the remedy?

First let it be pointed out that this positive statement does not bear out the claim, so frequently made, that Christianity has been the light of the world, the guide of humanity through the ages. Professor Peile evidently does not think so, and he is in a post of great authority in the theological world. To continue:

Christianity has been believed; it has not been carried out.

This all depends on what is meant by "believing." Perhaps it has not been believed and that is why it has not been carried out.

The great majority of mankind have for centuries done everything with the Moral Rule of the Gospel except obey it. They have read it aloud in their churches and their homes; they have enshrined it in a magnificent system of worship; they have glossed and commented it, till it bears a suspicious resemblance to the code which they find most profitable. "The world," Bishop Westcott declared, "got into the Church in the fourth century, and we have never been able to get it out since."

Possibly the Bishop meant that we have not been able to get worldliness out of the Church, but his remark can be taken in another way. The lecturer goes on:

The cunning Spirit of the World takes the ferment which worked such radical changes in the constitution of the human soul, and by inoculating Society at large with a very dilute and attenuated serum, secures for it a measure of immunity from violent and inconvenient attacks. The normal experience of the individual is a very mild and manageable form of the fever which consumed St. Paul.

Religious revivals, we are told, have been moral and religious rather than dogmatic. They depend on the mind of the average man. "A World-faith can never spring from the travail of self-conscious intellect." A Christian life is the only argument that unconverted Humanity will attend to, and "I think uncon-

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

verted Humanity is right." If the Church is ever to convert the world, she must do so by example.

Here one may pause to wonder whether it is the Christian gospel that regenerates humanity, or humanity that regenerates the Gospel. This is indeed a dilemma. It is usually solved by saying that what you call the Gospel is not the real Gospel; but I will show you the real Gospel and then you can regenerate yours. Let us see what the professor says about it. For the church

the secret of success lies in "absolute unqualified obedience to Christ's plain teaching as He spoke it. That teaching, as we find it in the Gospels, is a small body of positive precept; it seems to me perfectly clear in meaning, and almost wholly ethical, laying stress on character and on conduct as the necessary test of character."

So we are to go by the sayings attributed to Jesus in the four canonical Gospels. It is needless to say that those are what the Occident has been fighting about ever since it knew of them. But both the Professor and his reviewer qualify their statements so much as to render them practically nugatory. The former says that we must have unqualified obedience to the precepts of the Sermon on the Mount, but that *they are not all of general application*. And the latter, while objecting that this is a serious qualification, says on his part that "it is at least possible that He (Jesus) meant his words, not as an absolute rule for any, but as an aim for all."

All this is very vague and allows plenty of latitude. If the Church gets away from where it is and goes back to this, it will merely have gone all round a circle. The lecturer argues that unqualified obedience to the teachings justifies war at times, and he takes to task those who, on the very same grounds, condemn war; and the reviewer argues on the latter side. Economic questions are discussed with the same uncertainty.

The professor believes that we are on the

verge of one more great religious movement, perhaps the greatest the world has known. On the intellectual side it comes from science, as a recognition of the unity of all life; on the social side, as a reaction from exaggerated individualism; on the religious side, as a quickened belief in "the brotherhood of all men in Christ." He thinks this will

alter all social and economic conditions, but recognizes that it is useless to fight against conditions as long as the ideas of which they are the natural outcome still exist. He concludes:

I believe the Miracle which alone can deliver us from the inexorable tyranny of economic laws is the influence of Christ upon Human character.

Let us say the influence of the Christ-spirit, as proclaimed and manifested in all ages by many World-Saviors, which recalls forgetful man to a recollection of his own divinity, and reminds him that he is an immortal Soul and should live as befits an immortal Soul. That influence must proceed from the human heart. Jesus' words are of value, not because he said them, but *because they are true*. They relate to facts. He called attention, as did other Teachers, to the fact of man's latent Divinity and possibility of perfection. Let us seize that fact; how we came by the knowledge of it will then take its proper place in thought.

So long as the influence known as Christianity taught and acted upon this truth of man's divinity, it was justified in making high claims; but when "the world got into it," those claims were not justified, nor were they fulfilled. What we need to go back to is faith in our own nature. Other religions have had the same pure and lofty beginnings and have been in the same way overlaid by the results of man's perversity. Human evolution proceeds, during the present cycle at least, by successive revivals of the great Knowledge. And each time man learns more. When man emerges from the present cycle of darkness, he will not again make all the same mistakes; experience has taught him. Discriminating, he will recognize the great Teachers of life's mysteries and duties, whether they be in the page of history or in contemporary life.

Religion is one and eternal; the Christian presentation of it is by no means unique. Jesus may have been a Christ; but he was by no means the only one. STUDENT

# The Theosophical Forum in Isis Theater

S a n D i e g o C a l i f o r n i a

## LAST SUNDAY AT ISIS THEATER

Mr. Cranstone Woodhead Delivers an Address on  
"Spiritual Footprints"

MR. C. Woodhead read an exceedingly interesting address at Isis Theater, San Diego, last Sunday evening, which is reprinted nearly *in extenso* below. Some excellent musical selections were rendered by the Râja Yoga Quintet.

OBSERVER

In the book which is generally accepted as the father of all modern story books for boys and girls, viz. *Robinson Crusoe*, is a powerful description of the feelings of a man stranded for years on a desert island, thinking himself entirely alone and isolated, who suddenly comes upon the print of a naked human foot upon the sandy shore of his island prison. We have all read this book in our childhood, and none of us have doubted that the mark which was found upon the shore was an unmistakable proof that someone had been there. The man who made it had disappeared, but the form and appearance were such as to leave it beyond question that a human being had passed that way.

And similarly when the modern student of the earth's history finds upon the surface of a piece of rock which he has split open the marks of the foot, with toes and claws, of some gigantic prehistoric lizard or bird, which walked upon the sand before it became solidified into rock, he knows that he is face to face with the impress of some long-forgotten animal which passed that way countless ages ago.

The faculty of recognition in these cases is an intellectual power. By education and the reasoning power of the mind, informed by the senses, we are enabled to judge of the nature of that which has transpired. The Red Indian had this quality developed to an extraordinary degree. The displacement of a few twigs among the bushes, or of the pebbles on the ground, gave him an insight into the nature of what had transpired in the trackless woods, and often enabled him to judge how long ago these happenings had taken place.

And so, in looking back into the past history of the world in which we live, we are able to recognize the footprints of the great ones of the earth. But the faculty which gives us this power of recognition, is not the same as that of the geologist or the Red Indian. It comes from a higher source.

In order to understand this more fully the student of Theosophy has to consider attentively the history of the past, not only as regards the outer effects or apparent facts of history, but also the more deeply hidden causes which produced those effects.

In a recent address in the Isis Theater Katherine Tingley said:

"If we go back into the far past, we realize that ages and ages before there was any outward manifestation of religion, there was an absolute religion in the heart; that humanity then had its ideals, and that really religion was born of ideals, and theology born of religion, and fanaticism follows in sequence as a result of theology, as it is presented today. It is the digressions that we have from the old ideals of our ancestors, that lead us so far away from our ideals, so far away from any absolutely honest conviction that man is divine. . . . Theosophy in bringing its message to the world is endeavoring to re-awaken the divinity of man, to bring home to his mental consciousness the fact that he has a higher consciousness, and that knowledge must come from that Higher Self. It cannot come from ignorance;

it cannot come from faith; but it must absolutely come from within."

And so in looking back to trace the Spiritual Footprints of the past we must depend upon a higher faculty of recognition than the brain-mind alone. The once universal Wisdom-Religion of the Golden Age has well-nigh faded from man's remembrance. Ages of physical progress have resulted in a material prosperity, overshadowed by a black cloud of human pain and sorrow. The heart of humanity is wrung with every sort of doubt, dissension, want, suffering, and hunger. Whilst empires rise and fall, and science, trade and manufacture flourish, anarchy, crime and insanity continue to increase. The old ideals are lost and if recalled are too often derided.

Yet the faculty of recognition of the real truth is always potentially present in the human heart. Deep down it may be found by him who diligently looks for it. The spirit of divinity is always there and may be recognized. It is not found in any belief or any creed or dogma. It is not alone discoverable by logic or argument. It is not shown by sentimental emotion. It is found in self-identification with all the sorrow of the world, with compassionate love which is without passion, with a heartfelt consciousness of all the evil which exists, *combined with the knowledge—not the belief, but the knowledge, that there is a remedy.*

And this absolute knowledge that there is a remedy comes to the student of Theosophy as a divine inspiration. It is from the heart-life of humanity that it comes, and it is this knowledge that enables a man to recognize the spiritual footprints of the past. It cannot be conveyed in words, and it retires from the smoky atmosphere of argument, criticism, contention, doubt or disbelief; but it is there all the same and can be awakened by him who will diligently determine to pierce the darkness.

And so in looking for spiritual footprints, we look for the traces of those who have had some knowledge of those great ideals which may be compassed by the true student of human nature. We do not always find the history of these men written large upon the outer facts of the world's records. Some of them are scarcely known to the modern college student who thinks himself well informed. Yet they have had a powerful influence upon many an event which is a mystery to modern college professors, and their teaching has been the keynote of the highest progressive thought of many an age, the history of which has come down to us embalmed simply in the outer records of popular movements, or the wars of kings and dynasties.

The great world Teachers whose influence is historically known, have all left traces of their absolute knowledge of the divinity of man, and their attempt was to restore a knowledge of the lost ideals of the earlier ages.

In the writings of Lao-tze, the predecessor of Confucius, he continually refers to the teachings of the ancients in this regard. Krishna, the Indian Teacher, who flourished about 5000 years ago, was a restorer of the ancient ideals; and 2500 years after him Gautama the Buddha did much to re-establish the purity of knowledge which the lapse of time had obscured. The religions of India, as descended from the times of these great Teachers, have now lost much of their original purity, but Indian literature abounds with a wealth of spiritual knowledge which is but little known in the West, and the future will restore much of it to the attention of Western students as time produces the desire for a more intimate acquaintance with these buried treasures of spiritual wisdom.

In these days but little is known of the great seat of learning which existed at Alexandria for several centuries. Ammonius Sakkas lived between the second and third centuries of the Christian era in Alexandria, and was the founder of the Neo-Platonic school of the Philaletheians, or "Lovers of Truth." He was endowed with such prominent, almost divine goodness as to be called Theodidaktos, "the god-taught." Following him were Origen, Plotinus, Iamblichus, Porphyry, Hypatia, and many others who helped to make Alexandria one of the most justly renowned seats of learning that the world has ever produced. This school of the Neo-Platonists was the ultimate effort of the Higher Intelligences to check the ever-increasing ignorant superstition and blind faith of the times. It was the last product of the true enlightenment of Greek philosophy, which was finally crushed and put to death by brute force—and then followed the dark ages.

One of the most fortunate signs of the uprising of a wide knowledge of the truth about the ancients is the great interest which is now being taken everywhere in archaeological discovery. It is gradually beginning to dawn upon the world that the centers of old civilizations were by no means so barbarous and inhuman as they have so often been misrepresented to be. Everywhere there are traces of a high philosophy, of much good-hearted and humanitarian feeling, of wise and just laws, and of noble and god-like ideals. In ancient Egypt there was at one time a dynasty of divine kings, whose administration was characterized by the most careful adjustment of the rights and well-being of the people, without distinction of class or caste. The literature of ancient Egypt, such as the celebrated *Book of the Dead*, abounds with the loftiest teachings of man's divine origin and destiny. The same can be discovered in the teachings of the Mexican Quetzalcoatl, and the Persian Zarathustra. Their doctrines were the same as those of the Sages of India and China, and all are derived from a Wisdom of a still more ancient date, the origin of which is lost in the mists of hoary antiquity.

Turning now to more modern times, there have always been those (though few and far between, as compared with the countless millions of unthinking humanity), who have passed on the words of truth down the ages.

Take, for instance, the German mystic Jakob Boehme, who lived at the end of the 16th century. In his boyhood he was a common shepherd, and became an apprentice to a poor shoemaker. He had a constitution which is most rare, one of those fine natures whose material envelope impedes in no way the direct intercommunication between the intellectual and the spiritual Ego. His writings have had an enormous influence upon the spiritual progress of medieval Europe. "Man must acknowledge," he writes, "that his knowledge is not his own, but from God, who manifests the ideas of Wisdom to the Soul of man, in what measure he pleases." Of this statement of Boehme Mme. Blavatsky writes as follows:

"Had this great Theosophist mastered the Wisdom-Religion he would have expressed it otherwise. He would have known that the 'god' who spoke through his poor uncultured and untrained brain was his own divine Ego, the omniscient deity within himself, and that what that deity gave out, was not in 'what measure he pleased,' but in the measure of the capacities of the mortal and temporary dwelling it informed."

During the Middle Ages there were others also who have played an important part behind the

scenes. Of these we might cite Rosenkranz, the founder of the Rosicrucians, Roger Bacon, Paracelsus, and Count St. Germain.

Coming down to more recent times, the Teacher whose name will go down to posterity as the one who restored to the Western world the knowledge of the ancient spiritual ideals, is H. P. Blavatsky. Her gigantic work, although only recently begun, has already had a world-wide influence, and it is surely being recognized as supplying the needs of the present age. Its claim for recognition rests upon two aspects of Truth. Firstly, it is intellectually and historically true, supplying the much needed link in the mental purview of existing things; but principally it appeals to the heart-life of humanity, to long-buried and slumbering but now awakening ideals,

itsual footprints thus expresses it in his well-known *Psalm of Life*:

Lives of great men all remind us  
We can make our lives sublime,  
And, departing, leave behind us  
Footprints on the sands of time.

Footprints that perhaps another,  
Sailing o'er life's solemn main,  
A forlorn and shipwrecked brother,  
Seeing, shall take heart again.

Let us then be up and doing,  
With a heart for any fate;  
Still achieving, still pursuing,  
Learn to labor and to wait.

the past than into the future? This old miner's clairvoyance is of the useful sort, and such does not visit the curious seeker after "curious powers."  
H.

#### A Friend of Children

THE Rev. Benjamin Waugh, Founder of the (British) National Society for the Prevention of Cruelty to Children, who has recently died, was the first to convince the public that cruelty and neglect were widespread, and induce them to sanction the violation of home privacy when events rendered that necessary in the cause of protection. His work was unsectarian, and its value cannot be

Lomalind Photo. and Engraving Dept.

THE U. S. FLEET AS SEEN FROM POINT LOMA, AT NIGHT, ON APRIL 16  
The moonlit waters of the bay and the illuminated warships produce a fairylike effect

which dwell at the root of existence and give the impetus to every motive of thought and action which is noble and true and worthy of acceptance.

In looking back upon the history of races and of nations, it is plain to see that the times when a step forward has been taken in spiritual progress are not by any means those which are identified with the times of apparent ease and outward prosperity. They have been the times of stress and strain, of much searching of heart, and of a painful and arduous reaching forth towards new ideals and new freedom. The spirit which led the Pilgrim Fathers to leave their native land and cut asunder all the ties of home and kindred in search of freedom and progress; the spirit which led the United States to proclaim their independence and base their ideals upon their wonderful Constitution; could only succeed through the grim determination of noble idealists to carry out that measure of transcendent optimism which the progress of the age had opened to their inner urge.

There is a simple little classic poem of one of our great American poets which will remain in the memory of man when many a more pretentious effort is forgotten. Longfellow in speaking of spir-

#### A Miner who "Smelt Danger"

THE papers report that workmen, digging a tunnel in Santa Ana Cañon, were saved from being buried in a landslide by a warning from an old miner, known as "Dad," who shouted that there was going to be a landslide, as he "felt it in his bones." The men ran, and in a few seconds came the slide of hundreds of tons of earth and rock.

Animals are also able to detect danger and avoid it in a similar way. In man the sense is masked by the activity of his mind, and also dulled by lack of use. This faculty may be unusual, but it is not wonderful; for we have not the least idea how the mind perceives things through the five ordinary senses. In fact science does not know what the mind is. Yet, if this mysterious dweller in the body can utilize the pictures on the retina and the vibrations in the ear, and turn them into meaning, why can it not do other strange things? Again, why is it easier to look into

overestimated, it being entirely free from the admixture of spurious motives or officiousness. He is chiefly responsible for the Criminal Law Amendment Act, which included the provision that magistrates might take the evidence of children too young to understand the nature of an oath. In 1889 was passed the Prevention of Cruelty to Children Act, and the Society received a charter of incorporation in 1895. T.

#### A Veteran Pianoforte Maker

MUSIC lovers will be interested in John Brinsmead (England), whose name is a household word among pianists, and who very recently died at the age of 93. His wife died a few weeks before, and last June they celebrated their golden wedding, receiving the congratulations of the King and Queen as one of the oldest couples in the kingdom. He attributed his long life to a love of fresh air and exercise. Many of the most important improvements in the modern pianoforte are the result of his inventive genius.

# Art Music Literature and the Drama

## The Spirit of the German Renaissance in Art

IT is impossible to grasp the spirit of the German Renaissance without some knowledge of the life and art of Albrecht Dürer, for although it was contemporaneous with the period of the Renaissance in Italy, it was not wholly like it in spirit.

Dürer was born in Nuremberg in 1471, six years earlier than Titian, twelve only before Raphael. Caxton had not begun his great work in England, and wood-engraving, of which art-craft we moderns still acknowledge Dürer to be the great exponent and teacher, had been invented but a decade at Dürer's birth. The picture (see illustration, "Portrait of Albrecht Dürer by Himself") tells the story of the inner qualities that distinguished Dürer's art—dignity even to the point of seriousness, sometimes sadness; a great tenderness coupled with the depth that is and can be born only of the meditative quality in one's nature; a great sweetness and sincerity; the capacity for complete intellectual and technical grasp of a science or art; an unusual capacity for discipline and effort; an abiding trust in the ideal.

This stands as one of the best known among all the world's great portraits, and one that can be studied and loved and learned from, to almost better advantage than any other. What a world is revealed by the hand, its sensitive, mobile fingers foiled—balanced, rather—by the strong, large, steady, thumb! How much of inner dignity expresses itself in pose of head and "set" of shoulders, and that it was not an idealized portrait his contemporaries state. They also tell us that while the life in his native city had in his day many harsh and jealous aspects, Dürer stood out above these in singular freedom,

distinguished from his fellow-citizens also by the stately beauty of his aspect and the rich elegance of his attire. Every reader will be familiar with the portrait in which he has represented himself at this middle period of life—the nobly formed oval countenance, with the short beard, the long curled locks flowing over either shoulder, the upright brow, the steadfast penetrating gaze of the large, perfectly cut eyes.

Dürer's father was a master goldsmith of the city of Nuremberg (and of goldsmithing wood-engraving was technically a development) and the young Albrecht, the second of his father's eighteen children, early learned the goldsmith's craft. He tells us in his letters that his father, who loved him devotedly and early recognized his gifts, took great delight in teaching him. At fifteen he was apprenticed to the principal painter in Nuremberg and for some years worked with other apprentices at the business of "turning out" (a not inappro-

priate term) religious paintings for churches or the private chapels of wealthy patrons. Fortunately he gained there considerable technical knowledge as a draughtsman, and there he also learned the then new art of wood-engraving. Then the *Wanderlust* seized him and his *Wanderjahre* began, during which he visited many of the great studios of northern Europe and also those of Venice.

After his return Dürer began to paint in a

It was in the year when he painted the last that Dürer brought out his three great woodcut books in folio form. In some respects these are more wonderful than all his other works, and it is certainly true they occupied an absolutely unique position in their day. These, too, dealt of course with Biblical subjects. But consider the time in which Dürer lived: printing had only just been invented and Luther did not enter upon his real work until Dürer was a man of middle age and settled life; what else could he do? No "ecclesiastical brain" was Dürer's; the eyes of his portrait show us the soul of a mystic. It was not until after the appearance of these woodcut books that Dürer did his best work in pure draughtsmanship, first on copper, then by medium of the newly invented process of etching.

Of the etchings and engravings of this artist those who know them best often say they feel least willing to speak. So fine and large and free are they, there seems nothing to be said. Go into any of our large Art Academies or Galleries, however, today, and you will find in the library-corner where photographic reprints of the work of the great artists of all epochs are kept, one, two, possibly a group of, earnest young students studying, perhaps copying, the masterly living lines of this artist. He knew form and could interpret it in a way to win for his works immortality in spite of their encasement within outworn theological subjects, *because he knew other things also.*

Like Leonardo, Dürer was proficient in mathematics, particularly geometry and perspective, and on these and other subjects such as Fortification, Human Proportion (*de symmetria partium in rectis formis humanorum corporum*) he left published treatises. It is the broader view, the broader mind, that we feel in his priceless drawings, so conscientious in line, such

a strange honesty do we feel all through them! What lessons they teach! How precious, how very precious, a legacy! STUDENT

THE great art of the West is comprised in two periods, one of some three hundred years ending with the Christian era, one of a similar space of time dating from the crusades to the Reformation; the art of Japan lasts unbroken from the middle of the seventh century to the middle of the nineteenth, a duration of twelve hundred years. *It is the most prolonged art record in the world,* and though it passed through many vicissitudes, it never lapsed, remaining always vigorous and true. At different times it expressed itself through different modes, sculpture, architecture, painting, decoration, and arts and crafts, and each in turn has served its purpose as a vehicle of expression for a passion for beauty that never failed.—R. A. Cram

PORTRAIT OF ALBRECHT DÜRER BY HIMSELF

new way, for he had absorbed the best that Italy had to offer and the painstaking care with which he was accustomed to study is shown among other things in the careful copies he made of the drawings of Mantegna. It was as a draughtsman that Dürer stood supreme, that rock and foundation stone upon which, if art be not builded, it will fall of its own clumsy weight sooner or later. His paintings were mostly portraits and devotional subjects, the greatest of the latter being *Adam and Eve*, the *Ten Thousand Martyrs of Nicomedia*, a rich altar-piece of *The Assumption of the Virgin* containing portraits as accessory subjects (and which perished by fire), and another composition intended for an almshouse at Nuremberg, but which "is now one of the glories of the Belvedere in Vienna."

**G**LEAMING like threads of gold woven through the motley-colored web of

European life during the great migrations, run evidences of the high esteem in which women were held by the North Europeans. Barbarians though they were, this and other evidences in their religion, their sacred rites, their laws and customs, all prove that they once drew inspiration directly from the fountain-head of that Spiritual Knowledge that fed with its living waters all the great civilizations of gray antiquity, of ancient America, of Egypt, of India, and later of Greece and Rome. But they appear as broken fragments or distorted images of erstwhile truth, leading their adherents to error and barbarism, instead of onward to the divinity of human life.

For example, brotherhood and freedom were the inalienable rights of all the Germanic tribes, and all were imbued with the dauntless warrior-spirit; it was as the marrow within their bones. The very word "German" comes from an ancient source, and includes in its triune significance, "brother," "freeman," and "warrior." The highest glory of the ancient *Herr-mann* (*g* and *h* being interchangeable) or "free warrior" was to die fighting on the battlefield. Such a death meant union with the Celestial Maiden, the radiant *Walkyrie* who awaited him. The very eagerness, for it was more than courage, with which they met death, proves that the old warriors knew that it was but the entrance to a larger, freer life.

Yet, heirs as they were of the grand Theosophy of the East, the cradle of the race whence they sprang, its symbology had well-nigh lost its spiritual significance. Brotherhood was understood only in its physical relation as the inviolable bond of the clan; the warrior was a fighter only with material brand and lance; and Walhalla was the celestial abode where earthly delights might be carried to extremes. One thread only of the ancient wisdom remained unbroken. In the reverence

## The Women of Ancient Germania

paid to pure womanhood, as the guardian of the Holy of Holies of human life, was the undiminished memory of the old Temple life of the East, borne along through all the centuries of wandering. This living germ was the very kernel of the greatness of the North European peoples. It was the spark of the ancient wisdom which kept them from sinking into utter

Lady Helen Forbes

Sophie of Bavaria, Duchesse d'Alençon, perished in the fire at the Charity Bazaar, Paris, May 4th, 1897; Elizabeth of Bavaria, Empress of Austria, was assassinated at Geneva, September 10th, 1898, as foretold by a gipsy.

**T**WO sisters, fair and good, and from the cradle doomed,  
Who once in holy innocence roamed  
By quiet paths; then by the curse of royal race,  
Sprang from the lowlier to the highest place,  
And trod the Via Dolorosa one by one.

Royal Sophia, Imperial Elizabeth  
Passed by the portals of a sudden death  
From sorrow-stricken life. Each sister in her fate  
Still walking hand in hand, as maids, they walked  
Of late,  
Ere yet the clouds of life eclipsed their morning's sun.

The younger sister as of yore showed forth the way,  
And dying flame tongues of her fearful funeral pyre  
Lighted the bier where the sad Empress-mother lay.  
Heard they the gipsy-whisper: "Beware of Steel  
and Fire"?—Selected

barbarism. It enabled them, in the end, horde of warring tribes that they were, to conquer the mighty civilization of ancient Rome, implanting in the South the seeds of their own morality.

Among the tribes of the North each hearth-stone was an altar-fire, a sacred shrine, presided over by the wife and mother. It was

her office to keep the fire perpetually burning upon the hearth, like the priestesses of

old. United only by the frailest of fraternal bonds, electing chieftains by raising the most doughty warrior among them on their shields only if a common danger threatened several tribes, yet all Germanic peoples were as one in preserving the sanctity of the hearth-stone and in safeguarding the honor of women.

There is something deeply mystical in the sanctity with which they regarded chastity. An insult to woman was considered an unpardonable crime and punished by death. It was the inner purity and innocence that they held so sacred, and not its outward semblance only. The ancient laws provided that an injury committed against a woman was to be atoned for by a much higher fine or *wergeld* than the same injury perpetrated against a man. Among the Alemanni and Bavarians it was double the amount, and among the Franks and Thuringians treble.

No dowry went with a maiden upon her marriage; her virtue and her beauty were her only portion, and one accounted all-sufficient, except the sword which was presented by her father to the man she was about to wed, in token of his passing over to the husband of his daughter the right to guard and protect her. Upon the morning after the marriage the husband gave to the wife a gift of land. This "morning gift," *morgengabe*, was the dower right of the woman, and nothing could deprive her of it.

Young girls were reared in the seclusion of the home, and it was their duty to assist with its manifold crafts. They did not associate freely with men, appearing in their company only with their mother when they assisted in entertaining them as guests under the family roof-tree. Thus safeguarded and protected, breathing the free, pure air of the forest, both matrons and maidens maintained the inner harmony of pure natures. By virtue of

the stainlessness of the inner sanctuary of their womanhood, they became intuitive to a remarkable degree, with the inherent right to stand at Nature's shrine, the interpreter of her mysterious workings. By their clear insight they could often see the causes of disease and cure them; many could pierce the veil of the future and foretell coming events.

While the free Germanic tribes acknowledged no leaders save in time of war, yet certain sacred spots, national hearthstones they might be called, did exercise a unifying influence over them. These drew the tribes together in general convocation as their untamed spirit of freedom permitted no man to do.

They reared no fanes in their holy groves, beside their charmed lakes, nor on their sacred mountain tops, but did reverence to the All-Father under the mighty vault of heaven, by the potent light of the moon, around a rude altar stone where a Priestess, famed for her prophetic wisdom, kept the fire burning. The sacred charm of such national hearth-stones was the real bond of unity among the tribes of Northern Europe.

From these sacred retreats, as history shows, issued the prophetic voices that warned the Germanic peoples to cease warring among themselves and to unite against the common conqueror, Rome. For example, in the year 10 B. C., the valiant Roman general Drusus, at the head of an immense army, invaded the North to conquer the Germanic tribes. As he advanced he laid waste the country with fire and sword. When he had pushed through the almost impenetrable Cherusian forest, and had come to the River Elbe, a Priestess of giant stature appeared on the opposite bank, and with prophetic voice bade him to fly, as "Fate had forbidden his passage through the land of the Cherusci." Seized with terror by the evil omen, Drusus fled and was shortly after killed by the falling of his horse. From the Cherusci arose the first great German hero, Armin, Arminius, or Hermann as he is variously known. He first called the tribes of Lower Germany together by the fire of his patriotism and eloquence; and by their union they were enabled to achieve a great victory over the Romans under Varus in the Teutoburger forest. When, later, owing to the base treachery of her own father, Armin's beautiful and patriotic young wife, Thusnelda, was captured and carried to Rome, where loaded with chains she was made to walk in the triumphal procession of Germanicus, the son of the abhorred Drusus, although bearing the indignity with a queenly disdain that put to shame her captors, and the news reached the North, it struck the unifying blow. All the German tribes, even those farthest north, flocked to the leadership of Armin, to aid him in avenging the insult to the high-hearted and beloved Thusnelda.

Cast in heroic mold, Germanic women played an important part in the history of Europe, when the whole continent was one vast theater of war. From time to time they loom up on the pages of history grand in the strength of their virtue or terrible in their power of evil. Christians though they later called themselves, in their vigor, and in their virtue, in the influence that they wielded over the fate of na-

tions, they were still pagan, the earthly counterparts of the celestial *Walkyren*. Yet great as their rôle in the past has been, a more splendid future awaits them. The ancient Wisdom-Religion, the true heritage of the Race, has been preserved throughout the ages of fierce human conflict, brought back to them again by Helena Petrovna Blavatsky, held as a sacred trust by William Q. Judge, and now re-lighted on many ancient hearth-stones of Northern Europe by Katherine Tingley. Who can say to what spiritual heroism the Wisdom-Religion, Theosophy, whose sacred fires it was once their mission to keep alight, will inspire them?

A DAUGHTER OF GERMANIA

the citadel of the constitutional rights of the people. Before its stately portal stands a heroic statue of Bismarck, "the Iron Chancellor" whose relentless hammer-strokes, old Teuton-smith that he was, more than any other force, welded the loosely jointed Federation of German States into the mighty modern United German Empire. HOUSES OF PARLIAMENT AND BISMARCK MONUMENT—BERLIN

### In Berlin, the Birthplace of German Unity

BERLIN, the capital city of the German Empire, is a modern metropolis. Its historical significance belongs to our day and time, so to us it may lack some of the picturesqueness and romance that belong to the older cities. Yet it should not, for Berlin is the birthplace of German unity. The city that felt most keenly the shock of the Napoleonic victories and the humiliation of defeat, through whose gates the royal family of Prussia was forced to flee for their very lives, it stands today the capital and dominant city of the united German Empire. Modern it is in every sense of the word. No city in the world has grown so rapidly in the last four decades as Berlin, and this despite every conceivable natural disadvantage. In it the national spirit had reincarnated, however, and to Berlin poured the flood of life of the awakened Fatherland after the crowning of the King of Prussia as Emperor of the German Empire.

Thus the long, beautifully straight streets of Berlin are adorned with magnificent modern buildings and monuments, all vibrant with memories of the recent past, when the fierce blast-fire of war made possible the beating together of the shards of a nation into an empire. Our illustration shows the noble proportions of the German Houses of Parliament,

been bestowed only upon the fathers of the State, no mention having been made of the heroic women who came to California in the early days and certainly did their share in building up our golden commonwealth. Now, a movement has been inaugurated by which some of our giant California redwoods are to be dedicated to our women pioneers. We would suggest that beautiful as is the custom of dedicating these giant trees already thousands of years old to the memory of our pioneer women, the project should be so enlarged as to include the planting of trees in their honor as well. It is a custom carrying with it much of the mystic beauty and wisdom of ancient days and deserves to be more general.

It was considered something of an innovation when a young woman, a lawyer, was appointed as assistant-counsel to the commission for the revision of the charter of New York City, just now concluding its work. However, this young woman has more than justified the wisdom of those who appointed her. She is already known as a successful lawyer and has won some fame as a legal writer. From the New York Law School, from which she graduated after receiving her degree from Vassar, she passed out at the head of a class comprising ninety-nine men and eleven women.

## A TELEPHOTO VIEW OF THE U. S. FLEET FROM POINT LOMA

The Fleet is lying at anchor in the outer Bay off Coronado, and is distant about five or six miles from Point Loma. The mountains of Mexico show up clearly in the background.

### Greetings to the United States Fleet

FROM the shores of Lomaland the Pacific Ocean stretched like a great shield of silver, in the early morning. The wind was resting in the caves, only the snow-white breakers rolled in at measured intervals, carrying the mighty music of the deep. It rose and fell; it lulled away into silence. These were moments of expectancy.

The Râja Yoga boys and girls were watching the sea. There! They are coming! Just around the point, pillars of smoke are rising from steaming vessels. Now, ship after ship floats stately and silently in on the broad plain, but its shining smoothness is not ruffled. The smoke forms itself into a background; it moves, it curls and floats like a living veil, hiding some mystic unknown land—but from this side shines the searchlight of the early morning sun.

What a picture! A fleet of American warships! Great majestic vessels, all white, the sign of peace, on a cruise around the world, paying friendly visits to many great nations on their way.

The Râja Yoga boys and girls waved their flags and cheered from where they stood high on the balcony of the Aryan Temple. All the glowing feelings of Peace and Brotherhood, all the patriotic enthusiasm in their young heart, all the love which they bore to the many nations which they represented, they sent with those cheers for the American fleet going around the world.

Their imagination pictured great things, as they watched the stately ships. To them it was a noble enterprise like the adventures in old days of knighthood. This was a hero fleet, going on a crusade to break down the walls of unfriendliness which had been raised between the nations, and show them that they were brothers. They were on a crusade against all that was cruel, evil and unjust in the world.

The cheers they sent out were not empty

sounds; the enthusiasm of young America with its grand constitution, found its vent, floating on the rays of the morning sun out to the ships of war. The great flagship saluted back—the ships understood, of that the children were sure.

The Râja Yoga children had greatly anticipated this visit. What would they give? What should they themselves like best, if they had been out on the sea for many months? Why, they would like to see the spring dawning over the land, the well-known flowers peeping from the ground. To their minds the answer lay plain before them when they roamed over the hills now decked in their spring array of purple, yellow and white. Flowers grown in this spot of Brotherhood and Peace should be sent to the ships of War.

Now, had the men of the navy seen this picture, their hearts would have kept warm for a long time. Children great and small would help picking flowers. Such merry crowds that trooped off to spread over the hills, you never saw! Such happy groups coming back home to empty their baskets of fragrant nature-messengers!—and off they flew again, like bees gathering honey. The boys! Not more than one little cotton-tail rabbit found its way to their collection of pets! Not a single horned toad, no lizards, no trap-door spiders or any other curious pets could lure them away from their one interest—flowers for the men on the fleet. They picked daisies, sea-dahlias, tidytips, sunshine, wild hyacinths, red Indian paintbrush, clematis, sage, yerba santa and other flowers, which were not considered too delicate to share the life on a battleship.

But here is the sweetest picture of all, a group of little babies, guided by their loving godmother. Could but the sailors have heard their baby-prattle as they toddled about gathering flowers for them, and seen their shining eyes when they came with their cart all full! The heart-messages that went to the great

battle-ships with the little blossoms, picked and lovingly held in their chubby hands, could conquer a nation.

Thus the fleet, when leaving San Diego bay, had aboard a great many new weapons, which they had not had before. These were fairy gifts, received when the ships of war reached the shores where the mighty Peace and Brotherhood of future America has its nursery.

The Râja Yoga students feel kindred to the Navy in many respects. The great importance of the discipline and training on a warship, without which it could never hope to win a battle, they understand from the light of their own training. Râja Yoga trains them in self-control, unity in working together, unselfishness, promptness, courage, vigilance, loyalty, order, simplicity, and, of greatest importance, trust in and obedience to the one in command.

Now look at the training in the Navy. Imagine the population of a big city, assembled in great houses to work together for the same purpose. Do you think that they could do it today? No! And why? Just because they would not work together in unity; each one is looking more to his own interest and own ideas, than to the interest and plan of the thing all should work for. So they lose their battles, whether they be to make their city beautiful, reform their schools or to fight the evils that destroy the heart-life of the nation. Then see how the many thousands of men who make up the Navy are working, and we can understand the value of discipline and the strength of unity.

Is it not grand when some hundreds of men, with different characters, likes, dislikes, habits and ideas, can work together with such precision, such order and promptness, that the ship, whose crew they are, becomes as one living intelligent body, and even has its own distinctive character, on which depends its success. One might be a happy ship, one a ship with many moods and tempers. The

# THE CHILDREN'S HOUR

ailors know and speak of the peculiarities in character of the different ships in their fleet, as we would of persons.

The ship might get sick, something going wrong; the sailors immediately know the cause for the sickness, and the cure; they know that some one of the men aboard is not doing his duty, or not working in harmony with the rest, or has failed to obey the orders of the captain promptly.

Imagine a discipline and training which makes it possible for a ship to be ready, after a few hours' notice, to sail for a three years cruise away from home. And what of being awakened in the middle of the night by the battle-alarm, and without any hesitation ready in place to receive the commands. Or what does it mean in the daily routine, to work together as if each man were a wheel in a clock? Could they stop to argue: "I do not feel like doing this now"; "this work does not suit me"; "I have some business of my own to attend to first, then I shall be ready"? Or, when a command was given: "I think he must mean some other way, I will wait and ask"; "I have other ideas of how to manage a ship"?

They must put away those ideas of their own for the sake of the ship as a whole.

The Râja Yoga students are also being trained to be warriors—warriors for Peace and Justice and Light. They learn to see how discipline is an invaluable help, in getting control of their own bodies and all selfish habits and desires, so that they may always be ready for the command and service of the Soul. Every one has this great commander in his own heart, ready with his wisdom to guide the course in life; but few are listening, or obeying, even when they hear. The Râja Yoga students are being taught this—to hear and obey the voice of their own Souls. No wonder that these boys and girls of Lomaland were interested in the fleet, realizing as they do what a great help the discipline of the Navy is to those who receive it, and feeling as they do what inner nobility and what a grand purpose could be built upon this foundation by the knowledge of Theosophy. This would make a hero-fleet indeed—one unconquerable.

## From the Fleet.

HERE are some of the letters sent in acknowledgment of the greetings that were sent from Lomaland to the ships composing the fleet while at anchor:

THE "CONNECTICUT," FLAGSHIP OF THE FLEET

U. S. S. KEARSARGE

San Diego, California  
April 17th, 1908

To the Boys and Girls, Râja Yoga School,  
Lomaland, San Diego, California.

On behalf of the officers of the U. S. S. Kearsarge and myself I wish to express to you the great pleasure it was to receive on our first arrival at a United States port after our long journey around South America your beautiful present of flowers. No gift could have been more appreciated. It is a matter of great regret to me that our short stay here will prevent me from thanking you in person for your kindness. With best wishes, I am, Very sincerely yours,

HAMILTON HUTCHINS

Captain, U. S. Navy; Commanding U. S. S. Kearsarge

Lomaland Photo. and Engraving Dept.

A PART OF THE RÂJA YOGA AUDIENCE ON BOARD THE "CONNECTICUT"

U. S. S. VIRGINIA

The Ward Room Officers of the Battleship Virginia desire to express their heartfelt thanks to the girls and boys of the Râja Yoga Academy for their sweet thoughtfulness in sending such beautiful flowers. The Officers trust that they might have the honor of meeting the boys and girls of the Academy aboard some time.

San Diego, April 17, 1908

## Fireflies

"THE stars have fallen down from the sky and are out on the grass," said little Maud as she came running in the house to her mamma.

"Stars in the grass?" said Mamma; "you must mean the fireflies. Why dear, those are little bugs or beetles and they carry those wonderful little lamps under their wings so that they may see at night. Let us catch one under a glass so that you may see the pretty light he makes. We shall not keep him long. See, he is not much longer than your thumbnail, and yet what a bright light he flashes."

"I should think the fairies would like them for lamps," said Maud.

"In the tropical countries there are many kinds of fireflies, some that grow three inches long and have three places in their

bodies where they carry their beautiful green lights. In South America there is a bush that the fireflies are fond of lighting on and at times this bush is ablaze with them. It looks like a ball of fire as the beetles twinkle their starry little lamps about.

"In Cuba," continued Mamma, "there are fire beetles that give such a strong light that a number of them placed in a wicker cage give enough light for women to do coarse sewing. The children love to play with them and feed them sugarcane. And in China a story is told of a poor lad who used to gather fireflies in a gauze bag so that he could use them for a lamp to study by at night. Of course he had to gather a great many."

"I should think the fairies would need them all for their feasts and dances," said little Maud.

E. N.

## Cats as Boarders

WHO ever heard of having cats as boarders? Yet there is a lady in a certain town who has such a boarding house and finds it a very pleasant and profitable way in which to spend her time. Many people who go away for the summer are much perplexed as to what to do with their cats, and although the neighbors promise to look after them there are oft-

en times when Puss's food is forgotten and she is lonesome for her people.

Our cats' friend finds that she has really more than she can take care of, and yet many a poor stray kitty finds a home with her, for she never turns away a "nobody's cat." She is very careful of their food and comfort, and has a hundred cats the year round. E.

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis

Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

SECRET DOCTRINE OF THE AGES  
IS THROWN OPEN TO ALL

## Limitations of Science

WHEN considering the status of modern science we should always remember the limitations which it imposes upon itself by restricting its sphere to certain limits. By virtue of this restriction it is unable to find the causes of the effects it studies, for those causes lie outside its own prescribed beat.

A very good instance is magnetism. We place a piece of iron near a magnet and the iron forthwith moves itself along the table until it reaches the magnet. Here is a complete mystery. We can see no cause; science can tell us of no cause. And note this: when we move our hand, we say that it is the muscles that move it, and that the nerves move the muscles, and the brain moves the nerves. But the iron has no muscles, nerves nor brain (at least not according to science); yet it moves itself over the table just the same. Are muscles and nerves and brain, then, necessary to movement? Evidently not.

And why cannot a piece of copper or wood move itself across the table in the same way?

## Science Knows No Causes

The mysterious power that we call magnetism is utterly unknown to us except by its effects.

And so with that more general form of attraction called gravitation. Newton generalized its phenomena into a law which he called the law of gravitation, being careful to state that he used the word abstractedly and mathematically and that he was ignorant of the cause of gravitation. But some followers of his misrepresented him and put it about that he had discovered a force called gravitation which caused bodies to attract each other — much to Newton's disapproval, as he says in his protest. It is as if one should see a house being built without being able to see the builders, and should say by way of explanation that the house was built by the force of erection. The fact remains that like Newton, we do not know why or how bodies attract each other. The word "attract" simply means "draw together." We must accept it as an axiom that physical bodies do attract (and repel) each other; just as we accept the fact that bodies have spatial extension, inertia, etc.

## Begging the Question Does Not Answer It

Attempts have of course often been made to resolve the pulling of gravitation into a pushing; and, just as we can say that a balloon is pushed up by the air which pushes down around it, so we can say that bodies are pushed together by some hypothetical fluid which crowds them. One favorite theory to

account for the mutual attraction of two bodies is to represent them as immersed, as it were, in a kind of ether hurricane, which urges them on all sides except where they protect each other and thus drives both to the leeward — that is, together. But why try to resolve a pull into a push? Is a push any more explicable mechanically than a pull? Push one end of a stick and the other end moves. How is the movement transmitted? One atom pushes the next, eh? But the atoms do not touch; there is "empty space" between them. So, even if we do find a theory that will account for gravitation by pushing, we are no better off than before and have merely explained the inexplicable by the inexplicable.  $x = 2y$ , and  $y = x/2$ .

## Physical Science a Set of Equations

The ultimate conception of physical science as regards the universe is that of a vast number of particles of matter separated from each other by intervals, and moving about. (We say "matter" advisedly, because the attempt to imagine anything else from the scientific point of view is merely self-deception.) Assuming the existence of these particles, and assuming that they move, we can then deduce the physical properties of the universe. What assumptions!

Why should we need an explanation of the attraction of the iron towards the magnet, when, in any case, we have got to assume attraction somewhere? True, we may one day discover a little more mechanism in connexion with the process and that may infuse a qualm of satisfaction, but still we do not know why atoms attract each other or how they push each other across empty space. When we see something moving that oughtn't to move, it comforts us to know that there is a string pulling it or a pole pushing it; but the string and the pole are only two rows of particles, not within shouting distance of one another (relatively speaking), as we are told.

## More Mechanism Discovered is Not Causes

Thus science, in attempting to find an explanation by exploring the infinitesimal, lands us precisely where we were before — that is, in a world filled with beings which move about. In outward Nature there are beings which move about; in the atomic world there is exactly the same thing, and a new atomic theory must be framed over again to explain their doings. We can reach no further rudiment than that of a Being endowed with Desire. This desire reveals itself to the eye of the chemist as "affinity"; it results in motion. It is of the very nature of desire that it brings about its purpose, except in so far

as impeded by contrary desires. We desire to move our arm, and our arm moves. If you say "nerves and brain cells," I merely change the word and say, we desire to move the brain-cell and it moves; it is all the same. So with the atom; it is a being; it desires to move; and it moves.

#### Self-Moving Beings

Any other explanation from physical science will be welcomed; Theosophists are ready to welcome any addition to their stock of information.

The moral is of course not in disparagement of the legitimate work of physical science, but against the tendency to dogmatize about ultimates and about the laws affecting human conduct and duty. A moral system based on such scientific knowledge must be of the same kind. Instead of causes we are given a formulated edition of the effects. Instead of reasons for conduct we shall be given a description of our conduct itself as a motive. Thus, man is actuated by selfish desires; therefore selfish desires are the prime moving force in life. When we think, the particles of our brain move about; therefore thought is a movement of the brain-particles. And so on.

But Theosophy is not merely critical and destructive. It has something to offer in place of what it criticises. But

**Understanding** such cannot be told in a text-  
**Follows Action,** book, though many hints can  
**Not Theorizing** be given which will start readers on the right lines.

The great key to Theosophical knowledge is that *conduct must keep pace with it*. Without this it would be useless to enter upon the deeper studies; the student would get side-tracked again, as so many do who try to study these things without the essential ethical basis. Clearly, if these things are to be explained which have proved inexplicable to ordinary science, new conceptions must be introduced to the mind—conceptions which it may be incapable of entertaining at all in its present state. This means that the life must be changed, and all things seen from a new view.

The higher science, then, necessarily includes ethics, nor can it exclude anything that is of importance to human life. Where modern science, by limiting its range, studies things in halves, true Science studies them as wholes, thus getting at the truth. May we not look

#### True Living the Great Science

for the establishment one day of a real Sacred College, such as existed of old; where, instead of the black gown, the candidate should indue a white robe and so be in truth *candidatus*; and where his head, no longer crowned by the symbol of a smoky chimney or the emblem of a black square, shall bear a garland bestowed only where the Teacher has discerned real merit and fitness? H. T. EDGE, B. A. (*Cantab.*)

### The Symbolic Records of Ancient Wisdom

THE origin of the Star and Crescent symbol is the subject of a brief article in the *Scientific American*.

The writer mentions the popular impression that it is of Mohammedan origin, but shows that it is found on the coins of ancient Rome, Greece, Persia, Parthia and Macedon, and that it was employed by the Babylonians more

than 6000 years ago. He traces certain of the cuneiform characters back to their original hieroglyphic form of a star and crescent. So far this is interesting; and, had the writer been content with this contribution to positive knowledge, one might have welcomed his remarks and attempted to amplify them with further contributions in the light of Theosophy.

Unfortunately, however, he goes on to express views regarding the mind of the ancient civilizations which one cannot but think reflect the spirit of a narrow scholasticism now happily waning into the past.

The symbol may have been not only the word for incantation, but a charm from which the evil spirits were supposed to flee. In every age, in the Orient, the people have possessed similar charms. The Assyrian kings stationed winged monsters with forms half human at their gateways, to keep all evil from entering within the palace. The poorer people suspended clay tablets above the entrances of their houses; the Jews attached the *mezuzoth* to their door posts, and the early Christians believed that Satan fled from the presence of the cross. . . .

Among the early peoples of Mesopotamia all of the heavenly bodies were regarded as deities; but the moon, because of the variety of the shapes which it assumes, and the irregularity of its appearance, was the chief of them all. . . . It is thus easy to understand how the crescent . . . was supposed to have the power to avert evil. . . .

With all due respect to the writer, and exercising the right of fair criticism, one must say that the above views suggest a lack of insight and the sense of proportion. One can scarcely enter upon a sympathetic and discriminating study of antiquity and practice and come to the conclusion that all those mighty races which endured so long and reached such perfection in many ways, could have been the constant victims of childish superstition. The Egyptians were so far our superiors in architecture and engineering that their very ruins, after millenniums, are our envy and despair. Their civilization goes back so far that we can discover no barbaric stage, but, on the contrary, greater knowledge the further we go. The Greeks have been the world's teachers in plastic art, and to this day we are glad to set up in our halls even the imperfect copies of their masterpieces. The Romans are pre-eminent for sound solid practical sense as well as for unparalleled executive power in the carrying out of stupendous works. Many of their writers had intellects which, reflecting the minds of the age for which they wrote, show that that age was gifted with both wit and wisdom. The Hindûs have very ancient mathematical and astronomical works in which the periods of the heavenly bodies (the "deities") are calculated to the last decimal place; and either they had telescopes and divided scales equal to ours or they made these calculations without them.

The ancients not merely used these symbols but they have so indelibly stamped the face of the earth with them that subsequent ages of destruction, literal and figurative, have been unable to efface the records. Moreover it is not in the Orient alone, but among all the tribes descended from the ancient Occident that we find the same symbols.

Fortunately there are scholars who have approached this fascinating subject in the spirit of modesty and adaptability which it deserves and requires. And such have dis-

covered that the book of symbolism is the key that (for some) unlocks and (for others) locks the door to an ancient science which is fathomless and all-embracing. What blows have been given to modern complacent neuroscience by the unraveling of ancient hieroglyphics, and how archaeology is every day revealing some new wonder of ancient knowledge and achievement! Should not these things make us prudent and modest in our assumptions?

We cannot treat the science of symbology in this piecemeal way, but must study it as a whole. Are there not the sun, the crosses of various forms, the serpent, the circle, the square, the triangle, the *Tau*, the twelve zodiacal figures, and a host more? Are all these mere superstition?

But the real key to knowledge and wisdom is a spirit of respect for that which we study, an ability to enter into the thoughts of other peoples, a genial and receptive mind, and a modesty which unscales our eyes from the films of acquired prejudices. Those who really desire knowledge will scarcely seek it at the hands of teachers who evince a lack of faith in the subject of their own teachings; but will rather approach those who radiate the life-giving spirit of reverence and toleration which they have themselves imbibed from their studies.

The appearance of superstition wherever we look is surely a reflection of our own age, which is burdened with superstitions of many kinds. It is not unusual for blemishes in the vision to be thus projected upon the field of view. But as long as we continue to view things in this false light, so long will knowledge be shut out from us. "Be humble if thou wouldst aspire to wisdom."

In an ancient and once universal science whose teachings were conveyed and recorded in symbols of natural objects—far more prolific in the meaning than mere words—the moon was the chosen symbol of the lower *Manas*, or mind. It illuminates the earth with a pale reflected light; it passes through shifting phases. But the Star, or often the Sun, represents that which lies beyond the lower manasic mind and from which that mind derives some of its reflected light. It is to be feared that many of us worship the crescent without its companion star, just as we worship the four-armed cross without its crowning circle; and it would indeed be a boon if we could carve up over our doors the full symbol as a constant reminder that our ordinary mentality is not the true source of light, but an ever-changing reflection. In that way we might chase a few of the devils of doubt and suspicion from our doors.

It is worthy of remark that there still exists a vast world-wide organization whose chief interest lies in the preservation and study of these veritable ancient symbols. Most of the members perhaps do not know why they thus preserve them; they but obey an intuition emanating from a source higher than their knowledge. But the day will come when those keys will be needed again, and then the purpose of their faithful preservation will be revealed. Like a grand old Egyptian ruin, the form of *Masonry* still stands solid throughout the ages against the day when the old building shall greet the craftsman who will refit and re-endow it with the ancient truths. STUDENT

## Some Views on XXth Century Problems

### Proving Something Else

**S**HARP and decisive criticisms are assailing the methods suggested by Professor Münsterberg for the detection of criminals and the testing of the reliability of witnesses. The criticisms relate to the proposed expert; to the criminal; and to the witness.

Owing to the apparent exactitude of his psychological methods the testimony of the future expert would be of the greatest weight with the jury; it would almost settle for them the question of guilt. But precisely therein lies the objection. His average probity will be no greater than that of the present expert witness. He will be just as buyable. But because of that very weight he will be much more worth buying. In ratio of the increased weight will he be increased bought.

The proposed method for the detection of the criminal is to pronounce a number of words, after each of which he is to give one related to it in his mind. After cat he may perhaps say dog; after lock, key; after water, wine; and so on. The interval between the lead and his reply is measured for a sufficient number of words. Then a number of words are introduced relating to the crime of which he is supposed guilty. They embarrass him and in order not to betray his guilt he tries to select reply-words which lead away from the embarrassing topic. If his crime is lock-picking and the lead-word is key he will try not to say lock, finally producing perhaps ring. But this effort takes time. Thus his guilt—according to the theory—finally comes out in a series of lengthened intervals.

The sufficient objections are two. First, that a nervous though innocent man, knowing the crime of which he was suspected, would behave exactly like a guilty man. Second, that a strong and positive examiner, consciously or unconsciously convinced of the guilt of his patient, would expect a result which according to the laws of thought-transference or unspoken suggestion a negative subject would certainly yield.

The new tests for witnesses are to determine their reliability as such. How quickly can they name a color shown to them; how quickly and how accurately can they estimate the number of black spots on a sheet of paper; and so on. A man who takes a long time to name a color, or who names it wrong, or who makes a wildly bad guess at the number of spots—would be called a bad and incredible witness.

The sufficient objection to this is that he might be a very good witness in respect of matters belonging to his *métier* though coming very badly out of the expert's laboratory tests. He might be color blind yet be a most accurate judge of sounds. He might not know one tune from any other yet be able to distinguish fifty shades between green and blue. A doctor might be in the habit of reckoning up with one glance of his eye every indication of present or coming disease on the face of every one he speaks to, and yet not notice as he walked past the place that the Fifth Avenue Hotel had been taken down and carried away

during the night, or his own door repainted.

We must continue on the present humble path. So far, we can only make a science of human nature on the condition of not applying it. The laboratory tests, in this connection, are really vivisection and have all that taint about them. STUDENT

### The "Star System"

**S**OME time ago a lady novelist wrote a story. Later, it was dramatized, partly by herself. But it would not fit the conditions of the modern stage. It needed entire re-writing. The principle according to which the re-writing was to be done was quite simple, but in its application so exhausting that the authoress lost her health for months.

*She had to fit the play for a star.*

To fit a play for a star means taking every clever and original speech out of the mouths where it belongs and handing it over to the star. The things that men, women, or servants say, the star must say instead. It isn't just words either; the star must have all: she must have the maid's apron, the man's cigarette; she must center the audience's attention even during scenes between others.

Whoever reads the lady's plaint will blame "the star system"—and avoid a theater (if there is one) where it does *not* prevail. The same man will approvingly read an attack on "Yellow Journalism"—in a yellow journal where it is printed with shouting headlines.

The star system prevails because the public likes it. If it did not, the vanity and ambition of the stars would avail nothing.

For that is the way the great majority see life. Each is his own center; he views all the rest as satisfactorily playing up to him or reprehensibly refusing to do so. He wishes to be the star on his own little stage.

At the outbreak of their war, when our attention was first predominantly called to the Japanese people, we found ourselves facing a new sort of ideal. The individual Japanese, we learned, was not the center of his own horizon. He was scattered anywhere about the field, and content to have it so. In the center was his country's welfare. We have a maxim—Self-preservation is the first law of nature—and we regard it as axiomatic. Perhaps it is in the West; but in the East notoriously not so. It would be good for us to add the words "in the West" every time we utter it, and if so amended, it were printed in the children's copy-books it would provoke a question good for them to ask and for us to answer.

The star system rests on our non-recognition of the self-consciousness of other people. They are but the setting of our own great and all-important part. Yet they have the same hopes, fears, pains and joys as we; they make the same little unsuccessful struggles towards their ideals as we; they condemn their own failures as sincerely as we; and as insincerely as we, excuse them. To a divine Supervisor, full of wisdom and benevolence, one man would be as exceedingly interesting and pathetic a spectacle as another. To him, human progress would mean the loss by each of his

fierce interest in himself and his acquirement of kindly understanding of and sympathy with others. At the end, those who had failed to acquire this would have no place in the divine commonwealth he had in view from the first. A consciousness is too microscopic and mean to know, be, or do anything valuable if it contains only itself. Others than the sluggard should go to the ant and the bee for a lesson.

So the star system will endure exactly as long as it is the mirror of life. STUDENT

### Narcotics and Genius

**P**ROFESSOR SCHINZ, writing on the death of Guy de Maupassant—in an asylum, where he had spent eighteen months—finishes:

We remain pondering why the representative of a higher humankind should not be spared that most horrid fate, to have his body survive his mind.

Yet the Professor's own account mentions that de Maupassant took cocaine, morphine, and ether! If the unhappy author had cut his throat, would the Professor wonder that he should not "be spared" the inevitable and mortal hemorrhage?

Cocaine was once, and to some extent is still, lauded as a cure for the morphine crave. No one ever yet succeeded, nor ever will, in getting one step out of the clutch of morphine by means of cocaine. The invariable and immediate result is a combination of the two poisons; and then the end is not far away. Cocaine leads, through even more agony, to a speedier finale than morphine. It liberates the reserves of capital, mental and physical, in greater volume than morphine, and the demand for the next dose comes in a few minutes.

Some of the States are waking up to the evils of cocaine and at least one of them has just greatly restricted its sale. In respect of morphine, little has yet been done. Both annually reap their tribute of many hundreds of fine and sensitive natures. When some young man of great promise, after writing or composing some few brilliant things, becomes extinct, and we hear in a year or two that he has died in confinement, one of these drugs is nearly always the finishing parasite. When, as often, their use follows upon open or private vice, they usually supersede it, quickly wrecking the remainders of health and intelligence. Yet it is to the half worn out victims of the former that their evil stimulus is most attractive. Of the latter, the biographies may say something; of the former rarely.

The States would do well, in addition to making the procurement of the drugs very difficult, to furnish institutions for the reception of their victims, homes whose entry should be easy and quite free from publicity; and it should be fully known that the withdrawal of the narcotics is very gentle and gradual. The one thing that possible patients fear is the agony of too quick diminution of their dose. There are times in the terrible career of nearly all of them, when, reassured about this, they will gladly consent to the necessary period of detention and gradual abstinence. M. D.

# Archaeology Palaeontology Ethnology

A CORNER IN ONE OF WESTERN INDIA'S FAMOUS CAVE TEMPLES

## Fossil Human Footprints Again

THE giant fossil human footprints of Carson, Nevada, were discussed in the *CENTURY PATH*, vol. xi. no. 2, where it was shown that the efforts of scientific men to explain away this testimony to the antiquity of humanity and the existence of giants involved them in the most absurd suppositions.

There is only a single set of tracks, as though the supposed mammoth had walked on two feet; and this was explained by supposing him to have placed his hind feet exactly in the track of his fore feet. But in the sets of tracks which occur the most abundantly, the foot is 18 to 21 inches long, and the stride only 27 to 38 inches; so that it is not easy to imagine the species of mammoth or mastodon big enough to have a 20-inch foot, and yet able, by a stride of 27 to 38 inches, to place his hind feet in the track of his fore feet. There are other objections equally awkward which there is not space to reproduce at length on the present occasion.

A recent paper repeats this scientific "explanation"; but, alongside of it, recounts another discovery, of which no explanation is offered. In 1819 human footprints were dug out of the west bank of the Mississippi at St. Louis. They were so low down as rarely to become visible. There were only two prints, right and left, near together, *impressed in the solid limestone*, with all the perfection of casts, the toes, the form of the muscles, the swell of the heel, and the flexures of the skin being reproduced. The ledge in which the prints were, was so old that it seemed impossible that they could have been made before the stone consolidated; yet they clearly were not artificial. A citizen of Harmony, Indiana, had them cut out on a slab and removed to Harmony, where they were on exhibit.

If all the testimony to the antiquity of man, and to the existence of giants, were collected and collated, it would confirm the teachings of *The Secret Doctrine* on those subjects. But when each case is treated separately and explained by a special theory

designed to meet its own individual needs, a specious case of explaining away may be made out. As archaeological discovery progresses, however, it will become more and more impossible to deny the claims of *The Secret Doctrine* as to the antiquity of man; and our conceptions will be so enlarged that we shall welcome as confirmations those facts which now we shun with fear. STUDENT

## Pharaoh's Bed Under Water

THE decision to raise the dam at Assuan to a greater height has made it inevitable that the temples on the island of Philae be under water for several months in each year. The small square hypaethral temple known as "Pharaoh's Bed," and the Colonnade, have been underpinned, and the temples braced with steel girders; but the paintings will of course be discolored. The irrigation of modern Egypt was thought to be of more urgent necessity than the preservation of these particular ancient ruins on the island of Philae. STUDENT

# ✻ The Trend of Twentieth Century Science ✻

## More Plant Cooks

EVERYBODY now knows of the bacteria in the soil which cook the aerial nitrogen for some of the plants, serving it to their roots in an easily eatable form. It may turn out that all plants keep bacterial servants. And it has recently turned out that several kinds of fungus do, and cannot develop without them.

In botanical phraseology these fungi, *Myxomycetes*, are parasitic upon the bacterial colonies. The bacteria are taken into the growing cells of the fungus, which they stain, and are digested by means of a ferment. The bacteria which are not taken in are also affected by the proximity of the fungus. Those that in their natural development in nutritive solutions give rise to fluorescence, lose this power; others lose their power of liquifying gelatin. These are obviously reduced to an abnormal condition, somewhat as bacteria which invade our blood are first paralysed by the opsonins before being eaten by the white cells. But in the case of the fungus the process is normal to its own growth. The bacteria thus serve as intermediary between the raw or dead stuff in the soil, which they cook, and the fungus; doing the cooking in their own persons.

There is some possibility that the relation may be closer. Bacteria have a trick, when they get old and tired, of collecting their living stuff into one point in their bodies. They rest awhile, and their bodies — except that intensely living point — die. Then the point, "spore," gets out of the dead body and starts afresh — a new incarnation. It may be, then, that in the cells of the fungus the whole bacterium is digested *except* the essentially living point; and that this point expands and becomes a cell (or part of one) of the fungus. If anyone likes to consider the bacterium as a living monad (in the Leibnitzian sense) embodied in what we see with the microscope, he will say that this monad has now the great advantage and stimulus of a sojourn for awhile in the body of the much higher fungus; and that when it is freed by the death of that part of its host it incarnates as a bacterium on a higher level of evolution, with keener emotions and larger sweep of thought. STUDENT

## The Heart Brain

PHYSIOLOGY, it appears, is not yet quite sure of the cause of the heart's motion.

It is a unique and highly intelligent organ, quite capable of managing its own affairs without the need of supervision or help. Taken out of the body of a just dead animal it will often go on beating for a long time — in the case of some reptiles even as long as thirty hours.

The open question is, how does it manage this? Is it because of its own private nervous system, or because of the independent contractility of the muscular fibers?

These fibers are not quite like those of any other part of the body. They partake in structure of the qualities of both the other varieties of muscular fiber, the voluntary and involuntary. They can conduct impulses better

than either, as if they had once tried to be, or had been, nerve fibers. And they have all the contractility, excitability and energy of voluntary muscles. Embedded in their midst are some minute nerve ganglia.

No one knows why the heart beats rhythmically. The assigned cause is the stimulation of the blood flowing through it; but as it is itself mostly the cause of that flow, the explanation seems shaky. Moreover it is no explanation at all of the somewhat complicated rhythm with which the four chambers pursue their several duties. The very latest theory, of course, is toxins. During the rest periods toxins accumulate, and the muscles as it were kick to get rid of them. Why they kick in a definite order and for exactly defined lengths of time, remains unexplained. Certain earthy salts promote contraction, and this has been offered as cause. It would do very well if the salts would be so kind as to be alternately present and absent in the blood.

Electricity, radiating from the ganglia in the walls, goes a little way, but still explanation lacks of its rhythmic generation in those ganglia. So the matter stands open.

The heart's nervous system is in relation with the other two, the sympathetic and cerebro-spinal. Hence it understands what the rest of the body is doing and what extra or less exertion may be required of it. And its rhythm, as everyone knows, answers to the emotional play of thought and feeling. What its own private consciousness may be, apart from its share in the consciousness of mental feeling and of the rest of the body, physiology of course does not know. It may be of a nature that we should have to call spiritual, related to that of the moving-spring of the universe. M. D.

## Electrified Water

IT is the work of the electricity on the water, not the electricity itself, that we want.

When the ordinary wall-current, or that from a primary battery, is led through ordinary drinking water, a little is decomposed into its elements, oxygen and hydrogen. Some of the oxygen appears in the form of ozone and this immediately gets to work. The work it does is to destroy every germ, oxidize everything oxidizable, and, it is now said, precipitate most of the inorganic salts in solution. Whilst they are still in precipitation an ingenious device recently invented enables them to be removed by filtration, and water almost chemically pure results. It is not as pure as distilled water, which is no disadvantage; but it is purer than any we are in the habit of drinking. And it matters little from what source it has been obtained. If the process is valid and can be extended and cheapened we ought to hear no more of typhoid. The Japanese army largely owed its immunity from disease to the ozonization of its drinking water, the removal of chemical matters by filtration being of infinitely less importance than the destruction of germs.

Ultra-violet light causes the generation of ozone in water; and it seems possible that if

sheets of water were exposed to good sunlight for enough time under violet glass they would become sterilized. It has also not yet been ascertained whether the arc light, lowered into the midst of say a barrel of water and allowed to play for some time, would sterilize it. It is very rich in violet and ultra-violet rays.

## Medical Folk-Lore

EVERY year the rattlesnake claims his toll of victims in this country. So far, official medical science can do little if a few minutes have elapsed since the bite.

But we believe it is true that many of the tribes of Indians have a treatment which they find successful and which they keep as a secret. It appears that a half-breed Delaware Indian, Johnson by name, once did sell this secret to a settler at Long Eddy, who in his old age made it known, after using it for years in all cases for which his aid was asked — and paid for. It was the application to the bite, every two or three hours, of the pounded root of the fresh "lion's heart," one of the milkwood family.

But it would appear that the plant in question is the "lion's foot" — *nabulus albus* — white lettuce, or "rattle-snake root." And also that the leaves, steeped in hot water and applied frequently, are equally effective. It grows all over America.

Another remedy, often mentioned along with the above and traditionally said to be equally effective, consists of Indigo and salt as a poultice, changed frequently. Most of the Indigo now obtainable is, however, artificial, not from the *indigofera tinctoria*. One would not suppose that the virtues would be the same.

In its wild chase after toxins and coal-tar products, medical science is losing much. The healing lore of the old wives and witches may be irrecoverable before its value is suspected. Some of it must represent the experience of millenniums. STUDENT

## Spontaneous Heating Due to Microbes

A SCIENTIST has performed experiments which, as he claims, prove that the spontaneous heating of hay is a physiological and not a chemical phenomenon. He constructed an apparatus in which small quantities of hay could be sterilized and afterwards inoculated. It was found that the sterilized hay did not get hot, but the addition of water contaminated with ordinary hay or with earth soon caused an elevation of temperature. A list of the microbes found is given. An important practical fact is that hay from the middle of a large heated stack is sterile, the microbes causing their own death by the heat they generate.

The boundary line between "organic" and "inorganic" is, however, getting shadier with every day. When we do finally catch the molecule under a cover-slip we shall probably find him wagging his tail and devouring other molecules. Even the nascent crystal, it is said, goes through a very lively moment or two on his way to final equilibrium. STUDENT

## Om Mountain

FROM the east shore of Lake Vettern, in which lies Visingsö, the isle where Katharine Tingley has lately acquired a beautiful and historic property, rises the Omberg. It rises abruptly from the surrounding plain and from the lake to a height of 900 feet above sea-level, and is of Archaean rock among the Palaeozoic of southern Sweden. The plain is a royal forest which is used as a school of forestry, and the rich and rare *flora* of the mountain makes it a paradise for Nature-lovers. The name is said to be derived from that of a Queen Omma who lived in the neighborhood in prehistoric times. Another view appears in number 23 of this volume. T.

## Garden Talk: Human Parasites

VISITOR. What became of those large beautiful flowers I saw on this plant yesterday?

GARDENER. They are faded and gone.

VIS. Do they last but a day?

GAR. That is all; they are short-lived.

VIS. Only a day! Ha, ha! They make a big show, but they don't last long. There's a lesson in that. But this little tree, what is it?

GAR. Oh, that is *Sequoia Gigantea*, the "Big Tree" of California.

VIS. Well, you ought to have a big sign painted to put up to it. How funny it seems to call that little thing *gigantea*!

GAR. Yes, it does; but nevertheless it has within it the possibilities of a giant, and if all goes well with it, future centuries will see a giant standing there. And if all goes well with us, and we unfold our divine possibilities, we shall be as much beyond what we now are, as the tree will then be.

VIS. I wonder why it was called *Sequoia*.

GAR. It was most fittingly so named by an American scientist from a great and noble soul, a chief of the Cherokee Indians, who lived a life of unselfish devotion to the welfare of his people. He knew it would be a great benefit to his people if they could read and write as the white man did, and he resolved to invent an alphabet for them. It was an arduous task, but he accomplished it, and invented

an alphabet of eighty-five characters, one for each sound in the language; and it was so simple that in a few weeks a Cherokee could learn to read and write. Some philologists pronounce it the most perfect alphabet ever invented. At first he was ridiculed and persecuted, as is usual with self-sacrificing helpers of humanity; but in time his invention was adopted by a council of Cherokee chiefs, a printing press established, and Cherokee literature and news printed. In a few months thousands of Cherokees were reading and writing their own language. That a great tree which is indigenous to American soil and has stood through many past centuries should be named from a great leader of indigenous Americans from a mighty and distant past is indeed most fitting.

VIS. That is certainly true. But here is a queer-looking thing! What is its name?

their own false systems, and give to them whatever vitality and attractiveness they may have.

GAR. And in like manner, as the purple of the flower partakes of the muddy color of the parasite, so the truth is obscured by the mixture of falsehood, and perverted from its rightful service of helping humanity, being made to adorn error and so confuse the seeker after light and truth.

VIS. Well, these human parasites often take bodily from our Theosophical literature some of the finest passages without a word of change, and without credit or quotation marks. They put them forward as their own to serve their own purposes.

GAR. And this is the vitality which gives life to the parasite production, and enables it to exist at all. But what an outrage so to desecrate the truth!

## Soil-Binding Grasses

IN considering coastal erosion in England, attention has been given not only to mechanical means for retaining the soil, but to the action of grasses in binding it. An estate owner on the English southern coast has noticed a rapid accretion of mud banks on his property. This is traced back to the arrival of a ship a few years ago from the Plata River with a quantity of rice grass on board. Some of the seeds became distributed with the result that the whole of the estuary of Southampton Water has become covered with the grass which catches seaweed and sand and is thus rapidly forming a high bank. ### Theosophy and Christianity

**T**HEOSOPHY is true Christianity. One can see this by carefully examining what Jesus taught, and comparing it with the great truths taught by Theosophy. Both have the same supreme source and the same object. But early Christianity soon degenerated into ecclesiasticism; hence the strife, war, and misery; for, had the spirit and teachings of Jesus been kept pure, that part of the world called Christendom would not present the sad spectacle which it does today. Modern Theosophy is the restoration of the spirit and teachings of Jesus, as far as the ethical aspect is concerned, but it is a great deal more than that. Jesus came specially to the Jews, as he said, "I was not sent but unto the lost sheep of the House of Israel" (*Matthew xv. 24, and x. 6*). No doubt while his mission was specially to the Jews, his teachings — as proceeding from the Ancient Wisdom-Religion, older than Judaism or any other form of religion — were universal in their scope.

But who does not know that the needs of this age of discovery and science are very much wider than the needs of the Jews in Palestine, or even of the whole Roman world in the first century? We live in an age which is keenly concerned with the origin of man and of the world; but the Bible, both in the Old Testament and in the New Testament, deals chiefly with moral questions: it has little to say about evolution, or about science. Hence the need for the fresh presentation of the Ancient Wisdom to be wider than that given in the first century, in order to meet the needs of an age of Science.

Modern Theosophy meets those needs. In the profound teachings placed before us in *Isis Unveiled* and *The Secret Doctrine* we have an explanation of man's nature and origin, and of the origin of the world, which is needed in this day, but which was not so greatly needed, and therefore was not so openly given in the first century. The moral teachings which Jesus gave are perfectly harmonious with the moral teachings now given in Theosophy. Who does not know that the central truth taught by Jesus was brotherhood? This is also the great truth taught by Theosophy. Jesus came as a divine Elder brother, and declared that men were brothers, sons of God, and should therefore live together as one great family. This is taught anew by Theosophy; but the foundation for brotherhood is now more fully explained than it was in the first century — it is shown to rest on the Unity of the One Life.

These things are not questions of dispute, they are matters of knowledge to every student who seeks, in an unprejudiced spirit, to know the teachings of Jesus and of Theosophy. Moreover, we should naturally conclude that this must be so, for it is in harmony with

an all-wise Providence which gives revelations when they are needed, but not before they are needed. Indeed Jesus himself gives us a hint that points in the same direction, where he says, "I have yet many things to say unto you, but ye cannot bear them now (*John, xvi. 12*). Therefore when we speak of the harmony existing between the teachings of Jesus and those of modern Theosophy, we do not speak of the scientific, but of the moral and spiritual side. And here we need only an ordinary intelligence and an unprejudiced mind to see that the great basic teachings of Jesus and of Theosophy are one and the same. Jesus wished men to live as children in a divine family. That Universal Brotherhood is what we seek to establish. We claim to be in line with the true spiritual Israel, and to represent the spirit and teachings of Jesus which ecclesiasticism has for centuries misrepresented.

Besides teaching brotherhood, Jesus warned his disciples against the spirit of the world, against love of domination, love of rank, love of power:—"Be not ye called Rabbi; for one is your teacher, and all ye are brethren" (*Matthew xxiii. 8*). Do good seeking for no reward. Love your enemies. Aim at divine perfection because ye are the children of the Highest. In a word, the Sermon on the Mount, which is the fullest exposition we have of the teaching of Jesus, is genuine Christianity, and genuine Theosophy.

Very soon, however, the followers of Jesus departed from the spirit of the Master, and Christianity degenerated into mere ecclesiasticism. The church became a hot-bed of intrigue and of a bitter, murderous spirit. We need only to read the history of Hypatia to see this — to see how utterly unlike Jesus the Church had become within two or three centuries. Christians did those very things which Jesus had warned them not to do. They sought after power and rule and lordship, and were "many masters." A spirit of contention and strife and persecution took the place of the spirit of Jesus; and it is one of the dominant features of Christianity today as well as in the past, and sharply distinguishes ecclesiasticism from the religion of Jesus. Christ wished his disciples to live and work together as brethren; but we know that this very soon gave place to episcopacy and the Papacy. This was a change in *form*; but the change in *spirit* was much more serious. Jesus never said a word about creeds and dogmas, and neither gave a creed nor gave any authority for making one. The burden of his teaching is on different lines altogether. This fact has not been seen as clearly as it should even by good historians. When you start to make a creed you move on intellectual lines only, and you act with the purpose of cutting off somebody; it is an intellectual spirit and a spirit of dividing or separating which prompts and underlies creed-making. This was not the spirit nor the method of Jesus.

The spirit of Jesus manifests by the intuitions of the heart rather than by intellectual disputations. Live lovingly together as sons and daughters in one divine family. Do good unselfishly. Help one another. Share with one another. Be rich through what you give rather than by what you receive. Be merciful and forgiving. Do unto others as you would have them do unto you. Be pure in heart and

ye shall see God. Be perfect like your Father in heaven. Make your religion result in a good life, for the "rock" on which the disciple should build is the correspondence between profession and practice — the reducing to practice the truths we know. "Every one therefore which heareth these words of mine, and doeth them, shall be likened unto a wise man which built his house upon a rock" (*Matthew vii. 24*).

Long before the Council of Nicaea disputings had taken the place of the heart-doctrine as given by Jesus. The natural consequence of this was strife, division, persecution. Men cannot think alike, and cannot be unified on the basis of the intellect alone, but only on the basis of the heart. Therefore Jesus gave no dogma to be quarreled over. And therefore the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY adopts no creed. It teaches many important truths, but has no creed or dogma. A belief is like a coat; a creed is like a strait-jacket.

The Theosophical Movement today is doing what Jesus wished his disciples to do. It seeks to realize something; it seeks to do good; to help; to produce harmony. For a long time, at least, men will see truth differently, but all can agree as to what is good, kind, loving, helpful. And whatever life the Church has had all through the Dark Ages, and whatever it has at this hour, has come about, not because of orders of clergy, bishops and archbishops; and not because of creeds and confessions of faith, and dogmas; but because some in the Church have lived the Christ-spirit rather than the ecclesiastical spirit.

It will thus be seen that very early in the history of the Church the teachings of Jesus were departed from, and that this departure was both in *form* and in *substance*. Instead of a simple brotherhood, bound together by love and devotion, it became a hierarchy bound hand and foot with creeds and dogmas. It would surely seem that some evil power had been early at work in the Christian Church inspiring it with those principles which would choke the good seed, and in the end become prolific of disunion, strife, and war. Ecclesiasticism is not the harvest of the good seed sown by the Master, but of the tares which the enemy sowed by night.

Theosophy is the pure teaching of Jesus given once more to the world in its hour of great need. Brotherhood — to feel brotherly and to act in a brotherly spirit — is the central teaching of Jesus, and it is the main teaching of Theosophy. Theosophy teaches that man is not a body which has a Soul, but a Soul — a ray from the Divine — clothed for a little while in a garment of flesh. Both Jesus and Paul emphasize the necessity for our overcoming the carnal self by the aid of the Higher Self. Paul says:

I delight in the law of God after the inward man, but I see a different law in my members, warring against the law of my mind. (*Romans vii. 23*)

This is in harmony with what Theosophy teaches concerning the Higher Self and the lower self in man.

Ecclesiasticism has taught men to look for God far away. Jesus, Paul, and modern Theosophy agree in teaching that we are temples of God, and that the Spirit of God dwells

in us. Theosophy teaches, as Jesus taught, that salvation from sin consists in overcoming the lower self and purifying it so that it may become one with the Divine—not a matter of book-keeping or legerdemain in which the guilty is cloaked over and supposed to be not guilty. What we sow we reap is the teaching of true Christianity and of Theosophy. The influence of ecclesiasticism has fostered in the world a disbelief in this divine law of the universe. Hence the great mass of the world today believes that it is an altogether clever and laudable thing to get more than you give. This is practical Atheism: it is practically a denial of God and of Truth. And yet such people call themselves Christians, and they read the words "Be not deceived, God is not mocked, for whatsoever a man soweth that shall he also reap," as if the teaching did not apply to life.

Who can measure the evil which has been inflicted on the world by the early departure of the Church from the spirit of the Master; and by the continued application of the sacred name of "Christian" to an organization which had become thoroughly impregnated with the spirit of the world? As the new revelation, given 1900 years ago was bitterly opposed by the priesthood of that day, so today the restoration of the religion of Jesus is opposed by the priests of orthodoxy. Jesus said to the Jews, "If ye believed Moses ye would believe me"; and it may be said to the Churches today, "Had ye kept the spirit of him whose name ye bear ye would have recognized and welcomed the fresh revelation of that spirit now given under the name of the 'Divine Wisdom,' or 'Theosophy':—not a new religion, but the old religion, even that which has been from the beginning."

(Rev.) S. J. NEILL

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** What proof have we of Reincarnation?

**Answer** Children in early years often preserve reminiscences of their previous life, and speak about them; but parents, not knowing of Reincarnation, treat these sayings as nonsense and discourage them. Thus the child soon forgets, and the growing intensity of present life crowds out the recollections.

To remember one's past lives implies a very high order of mental development and a memory of prodigious depth and tenacity. We do not remember most of the events of *this* life, and it is not surprising that we cannot carry recollection back beyond birth and death; especially since we never make any attempt to do so, but on the contrary do our best to obliterate all such recollections by absorbing ourselves in the material concerns immediately before us. Moreover we had not the same brain in our past lives which we have now.

Hence we cannot give such a direct proof as producing persons able to remember their past lives; nor if we could, would their testimony be much regarded.

As to remembering our own past lives, it would be necessary to set about cultivating memory to a degree the prospect of which would make most people shrink at the difficulty of the task. For that memory lies deep

down in the Soul, and to reach it would involve a thorough purification of the nature such as could only be attained by long and arduous effort and sacrifice of the personality.

And it is well that we have not this memory, for our weak natures are not strong enough to bear the burden of it, bowed down as they often are by the memories of the present life. Wisely and beneficently is the veil drawn over the past, nor do great seers and adepts walk abroad in a world where they would not be undisturbed to offer evidence which would not be accepted.

But there is plenty of proof of another, and in reality, more convincing kind. And here it is necessary to remember that if we cannot readily produce direct evidence of a specific case of Reincarnation, *neither can we do so of any other theory or belief*. In this respect all beliefs stand on the same ground.

You who demand human testimony to Reincarnation, perhaps refusing to accept the teaching otherwise, what is your own belief as to the after-life and how will you prove that? No one should assume such an inquisitorial attitude towards a theory unless they have already a much better one to offer. Is this the case? As a matter of fact we know it is not, and reflection shows us that we cling to old beliefs from familiarity and reject new ones from unfamiliarity, regardless of evidence.

The real evidences of Reincarnation are set forth at length in the Theosophical Manuals, and may be briefly enumerated as follows:

Reincarnation fits in with the various conclusions to which the facts of life lead us, and so is consistent with these facts and explanatory of them, where other theories are not so. This constitutes a vindication of Reincarnation which gives it the first place of probability among theories. Thus it explains the mysteries of heredity, and the adjustment of merit and demerit in human fortunes; accounts alike for the characteristics with which we are born and for the future development and exercise of those characteristics; and is in harmony with the universal law of ebb and flow.

The one-earth-life theory does not explain how men acquired their peculiarities of character, nor what will become of their unspent energies after death. It does not allow scope for the experience and growth of a Soul. It is out of harmony with the law of ebb-and-flow, according to which law all things pass through alternate phases of life and death.

In short, to a careful student, the evidences of Reincarnation are so overwhelming, and the objections so easily answered, while no other theory has these advantages, that it is the only reasonable explanation of the facts of life.

H. T. E.

**Question** What help will Theosophy give to control and overcome one's moods?

**Answer** The many moods that men and women are liable to, often change them in a moment from the most hopeful to the most despondent of mortals. Often some slight material change of condition may be the immediate cause for such changes, or again the cause may be hidden. How can we account for this, and why should we be subject to moods, which hide our real selves?

When we become interested in the teachings of Theosophy, especially those of Karma and Reincarnation; when we begin to realize that we have lived before, and that all the varying conditions through which we are now passing are the results of our past thoughts and acts; we find an answer to this question. As we come to know who and what we are we find that it is possible to control our moods, to be no longer governed by them; to be no longer subject to fear, doubt, worry, anger, hate, imagined want, selfish desire, and troubles of all kinds. For Theosophy teaches that in our innermost natures we are divine, and that our rightful place is that of lord and master, in the wonderful and complex human nature that has been built up for us throughout the ages. Even the fear of death can no longer touch us once we realize our divine nature. With this knowledge and realization of the teachings of Theosophy, the student has no time for doubting moods or personal whims; the truth and purpose of life are too great to admit of such, and the urge to use every moment for the benefit of humanity lifts him far above their influence.

With many worry is habitual, yet a moment's thought will show that it never helped anyone out of a difficulty, but on the contrary that the greater the worry the greater grows the difficulty, or rather the less able is one able to face it. The teaching of Karma throws an entirely new light upon all these things, and once we know that every cause must have its effect and that every seed sown will come to fruition, we should at least have the incentive to sow good seed. The conditions in which we find ourselves we may not, perhaps, be able to change, but recognizing that they are the result of past thought and that at least we can change our attitude to them, they cease to have a hold upon us.

Were there a knowledge of the effect upon man's complex nature of the varying moods that men and women give way to, there would be a much greater effort at self-control. Theosophy gives us knowledge, and therefore the help to overcome these hindrances to our progress. Not only do passion, hatred, worry, despair, if given way to, become the seed for like moods in the future, but also, Theosophy teaches, they disrupt the inner nature. Just as poison and deleterious substances act upon the physical body, so do moods and wrong habits of thinking disrupt the inner finer body which is within the physical. By our very attitude of mind we not only lay ourselves open to such moods, but positively invite them. There comes to mind the following in this connexion:

A crowd of troubles hurried by  
While he with courage waited.  
He said, where do you troubles go  
When you are thus belated?  
We go, they said, to those who mope  
And look on life dejected,  
We go where we're expected.

On the contrary, as one learns something of the real meaning of life and its hopefulness and joy, one attracts to one's nature all that is helpful and wholesome and right. Theosophy is essentially optimistic, and in the truth and light that it sheds on human life all personal moods and troubles disappear like mists before the glowing radiance of the sun. V.

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## Theosophy the Hope of the World

WHAT is the goal of the world's hope?

Certainly not that which the masses are coveting, forgetting all save the needs and the cares of today; not that which assuages the personal hunger for honors, power, pleasure, luxury; not that which satisfies malice, revenge, envy, hate. For even if all this still constitutes the greater part of human desires, yet there is scarcely one human soul, who, when called upon to lay down on the altar of the divine the innermost wish and desire of his heart, would not fall back from profaning it with such an offering.

Deepest down in humanity's heart lies hidden its hope, mostly slumbering and mute, perhaps hardly even vaguely felt. Yet there has been no time when the goal of humanity's aspiration and hope has not been consciously and clearly stated by the spiritual Teachers and Leaders of our race. And what they have said has been more or less faithfully and understandingly preserved by their disciples and followers in the holy scriptures of the world. Being themselves messengers from Higher Powers, and sent to teach humanity, they have all set forth eternal truth, the very core of all those records, much as the latter have diverged from each other by reason of the various authors' different points of view, national influences and prejudices.

Now it is just those differences which have most attracted the attention of men, and so they have come to believe that the religions have different origins of different value—nay, that only one of them, *vis.* their own, could be the true one. Churches and clericals have done their very best to foment this idea, thereby arousing and fostering self-righteousness, intolerance, hate, persecution; and everywhere men have tormented and killed each other, all this in the name of the "One true God and in his honor."

But those who guide the destinies of our race are watching over it. Amidst the spiritual and intellectual darkness and the moral depravity of the Middle Ages, they could not, as in the past, send any great Teacher, but they sent the men of the Renaissance, the Reformation, and the "Century of Enlightenment" to prepare the soil gradually for a greater spiritual sowing. Oppressed by restraint of thought and conscience, stultified by superstition and false worship, the European nations had to pass through a long and trying schooling before a deeper and freer thought and gentler customs could gradually clear the way for a purer and truer conception of religion and its real import. The sense of discontent with existing conditions, blended with a feeling that something greater and better was going to break forth, stimulated the people to eager investigation and study of the old records, and called forth a great deal of philosophical and theological speculation. A spirit of uneasy searching and seeking characterizes the latest centuries, and shows itself not least in the splitting of the Protestant Church into its numerous sects and denominations. There is evidently a need of more mysticism, more spiritual purport in religion, than is allowed by the sober intellectualism of Protestantism.

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

Where and when, however, Truth is really and verily sought, then and there she is not far away. It was reserved for the end of the Nineteenth century to find that which has been the unspoken but fervent longing and hope of centuries, namely, a system of combined religion, philosophy, and science, restoring to man his divine birthright and bringing him Truth, Light, and Liberation: Truth, so that he may know the real nature of himself and of his inner God; Light, to shine on his way and lead him on; and Liberation from that which alone hinders him from entering on the Way, *vis.* his lower, selfish Ego. This is the ancient Wisdom-Religion, or Theosophy, the oldest of all, or rather without any age, for it knows of no beginning. So Max Müller, the learned Professor in Comparative Study of Religions, was right when saying prophetically: "A new religion is what we properly need—though probably that religion will prove to be the oldest in the world."

"The oldest"—yes, but yet no mere rudiment of a religion, no mere seed to be developed by men as they themselves come to evolve their innate divine possibilities, but truly and verily Wisdom in her full, imperishable glory, a heritage coming down to us through infinite ages. It is only the terrestrial bearers of this Wisdom who have to evolve and to grow, in order to be able to receive more and more of it without the risk of perishing in its "consuming flame." As underlying all spiritual thought, it must necessarily, if even dimly, if even deformed by human additions and misconceptions, be present in every system of thought treating of spiritual things. Thus it becomes the always-existing, though often deeply hidden core, of all religions—the infrangible, everlasting bond between man and his Eternal Origin.

How beautifully the fundamental ideas of the Wisdom-Religion are expressed in *The Idyll of the White Lotus*. The young priest ready to sacrifice all for his calling as a teacher, is confronted at his last initiation with his divine prototype, and receives from him the holy verities through the proclaiming of which he will have to work for the salvation of his brothers:

"The soul of man is immortal, and its future is the future of a thing whose growth and splendor has no limit.

"The principle which gives life dwells in us, and without us, is undying and eternally beneficent, is not heard or seen or smelled, but is perceived by the man who desires perception.

"Each man is his own absolute lawgiver, the dispenser of glory or gloom to himself, the decreer of his life, his reward, his punishment."

What a clear light these words shed over humanity's life and destination! What hope greater or more glorious and certain than this, could be given

to man! After having fought and struggled, suffered, doubted and despaired through long ages, now here is offered to him an infinite growth and splendor. After having longed and aspired to perceive Divinity, to raise himself to the Divine, now here at last this very aspiration is bearing him forward towards the goal! After having grumbled at the incomprehensible injustice in the world, at his own and others' hard fate and unmerited sufferings, here he will get to know for certain that all those apparent, dark riddles are the unavoidable effects of laws, administered by eternal, immutable Justice, and that it is he himself and none other who has to decide whether his fate will lead him to happiness or unhappiness, to "glory or gloom."

Only by an ardent aspiration towards the Divine, by *willing* with all his heart to live its life, can a man gain the necessary force to lead that life; and only by living such a life may he come to partake of the glory which is his everlasting heritage. None other than man himself can do that; why should he have been equipped with all his divine possibilities, if it were not his task to develop them? And how could potentialities be evolved to living forces without man's own constant efforts in the directions required by them? To persons with no idea of the Theosophical doctrine of Reincarnation it is impossible to explain the occurrence of genius, which is generally called "a gift of the Gods," the real meaning of this being that the Divine gives itself to the man and woman having enough courage and perseverance to fight for it and gain it.

So Theosophy instils hope into a discouraged world, not only by holding forth man's divine destination and by making him know that it lies in his own power to attain divinity, but also by showing him the infallible path to the goal. It has been already said that the only hindrance to entering on that path and to proceeding on it, is his own lower, selfish Ego, his lower personality, having its root in the supposition that he not only in body but also in essence is separated from all other Egos, this making him believe that he must in sheer self-defense stand upon his own interests and claims as against all other people, without any regard for their right, perhaps as great, nay, possibly greater than his.

Now Theosophy shows us clearly that this is a fatal error; it tells us that we are, all of us, embodiments of the World-Soul and in our essence identical with each other and with IT. Our separate existences are simply an illusion, necessary for the evolutionary process, in order to develop self-consciousness, to make us through the experience of earth-life fully conscious of our inner One-ness and to teach us how to realize in those different existences the Unity and Harmony which is the essence of the World-Soul.

Such is the import of universal brotherhood, and the purpose of life is to make this a living power on earth. In trying to realize this aim, what can be to us of greater help than "the golden rule," adopted by all religions from the Wisdom-Religion and thus expressed by the Master of Nazareth: "All things whatsoever ye would that men should do to you, do ye even so to them." G. ZANDER M.D. (Stockholm)

## Last Sunday Evening at Isis Theater

### "The Study of History"

ISIS THEATER goers had a change in the usual program of the lectures on Sunday evening last in San Diego, for a young Cuban, Antonio Castillo, read a paper on "The Study of History." The lad acquitted himself well, and gave another evidence of the self-possession and independence of thought fostered in the Râja Yoga Academy at Point Loma.

It is said that the paper will be reproduced in full on another page of a subsequent issue of this REVIEW, so it will be unnecessary to quote from it this week.

Excellent music was rendered by the Point Loma Râja Yoga Orchestra, whose members are positively making a reputation for themselves for praiseworthy interpretations of the classics. OBSERVER

## Signs of the Times in the Churches

### The Decline of the Church

EXPRESSIONS of opinion on "The Decline of the Church" are so common that they scarcely attract attention. The following is a summary of one, which is as commonplace as it is typical.

The thoughtful observer must be struck by the fact that organized Christianity is losing its hold on the people. In England 75% of the people never enter a church door. In Germany the proportion is still greater. In France are hundreds of thousands who have never read a page of the Gospels. In America statistics make a poor showing. From all sides comes the cry that the number of candidates for the ministry is falling off. In Scotland, a theological country, the divinity halls (says our authority) are almost empty and men cannot be found to fill the pulpits. The Presbyterian Church of America reports that there are one-third fewer men studying for the ministry than ten years ago. All the seminaries of the Episcopal Church mourn a diminution in the supply of students. Even the quality of the men who do study is said to be inferior, being that which is left over from the professions and business.

Whatever the reason, the fact cannot be blinked that the Church as a vocation has lost all attraction for our young men.

The Church has done much social work, even to the danger of forgetting its special mission; but it may be doubted whether those who have accepted its mundane gifts have been brought any nearer the great spiritual realities that form the core of its message. Something is lacking, and organized Christianity is not in vital contact with the needs of the age. Today all institutions are being tried by the test—

Do they or do they not contribute anything to the life of the individual or of society? Do they meet any genuine need of which the mind is conscious?

### Stupidity in the Pulpit

So much for one opinion, in which we are but quoting an editorial in a leading daily paper. Another leading paper gives a sermon by a Baptist preacher in New York, who deplores the decline of attendance and attributes it to the fact that *the church is not in touch with the times*. The increase in his Church has only been one-fourth of the birthrate in that Church.

The decline in Christianity is universal. In England, in France, in Spain, in Italy and in Germany, we hear the same cry.

The spirit of the age has gone ahead, but we have made no progress in the old formulas, the old theology, the old sanction. We are afraid to speak of religion. When we do so, we speak with bated breath, apologetically.

The pulpit is out of touch with the times. . . . Many thinking and progressive young men and women have been driven from the church by the stupidity of the preachers.

### Theology Behind the Times

A Doctor of Divinity writes in the *Harvard Theological Quarterly* a paper on "The Collapse of the New England Theology" and concludes that it died mainly because of its inhospitality to new ideas. The theology that is to win the youthful and enthusiastic minds of New England today must be loyal to all the facts and to all truth from whatever quarter it may come. It will build on all the facts which criticism, psychology, and experience can yield. And he looks for the coming of a prophet who shall weld all the materials of Christianity and of modern thought into one great whole. STUDENT

### What Will He Do With It?

WHEN a man begins to find himself going down hill physically, with or without some one ominous symptom of failure, he is usually alarmed. He looks at his habits, notes the hurtful ones, notes the absence of some good ones, perhaps takes to athletics.

He may put off the descent, and the appearance of the ominous symptoms, some years; perhaps a good many. But as he is not physically immortal, he must in the end face them again; and in the very end succumb.

He knows that; but unless he translates his knowledge into a doing of some kind, he might almost as well have died at the earlier period.

It might be a good plan to spend the added years in getting into the consciousness of immortality.

There are two consciousnesses in man, one of which is self-knowingly immortal and divine. The other is the ordinary consciousness which we call self, full of today's and yesterday's and childhood's doings, and of the feelings of the body. The task of life is to open the latter to the former. Then the *great life* is attained even in the body.

To reach the Divine we must imitate it.

Well, how does it spend its time, so to speak? *In sustaining the life of all that lives* by an outgoing force which when we use it to sustain the lives of our fellows, we call compassion. It is not a mere pious feeling; it is the sustainer of life, and it will sustain the inner life of him who uses it as it does of him to whom it is sent forth. To get out of the separate life more and more day by day, to get into consciousness of the needs of the lives of others, to feel at one with them, and with ever more unselfishness to work for them in feeling, thought, and act—is the path to immortality now. There is no other. You can only propitiate and earn the Divine by trying to feel as It feels, by spending your time as It spends Its. The artist may compose for men, or for his own renown; it makes all the difference. The schoolteacher may teach for money or for love of the children, thus giving them of her life. It makes all the difference. The Divine only honors and crowns with consciousness of immortality those who work in its way, with its all-giving feeling. STUDENT

### Japanese Cosmogony

A CONTEMPORARY writer on Japan summarizes the cosmogony of that land somewhat as follows:

In the beginning naught was, and the whole earth was as chaos. Then, in some strange way, earth and heaven became separated; dimly, gods appeared and then disappeared, until at last there came into existence two deities, man and woman, who produced the worlds and all that in them was, giving shape to all things. Izanagi was the man, and Izanami the woman, and from that celestial marriage sprung not only the islands of Japan but the generations of the gods and the great deities of the sun and moon. Some of these gods went to dwell in the blue plane of heaven; others remained on the earth and became the ancestors of the Japanese.

The summary is quoted by a certain modern commentator with an ill-concealed sneer, but read in connexion with the writings of H. P. Blavatsky, particularly certain Stanzas that she translated for the benefit of students and which are still accessible, the account acquires a new and symbolic meaning. To those who have read these Stanzas with even a shadow of sympathetic understanding, this symbolic account but serves to reveal much, very much. To those who have not the key to the Mysteries that the deeper study of Theosophy gives, all such symbolic records serve merely to conceal. It is no accident that all nations, when we reach their heart of hearts, have similar legends and similar creation myths, deluge myths, etc. These are but as various and sacred garments, fashioned for the vesturing of the Truth. STUDENT

THEY who know true wisdom, and whose minds are pure, behold the whole world as one with divine knowledge, as one with thee, O God!—*Vishnu Purâna*

### The Church as Leader

**A** FRENCH Romanist, M. E. Vacandard, has published an extraordinarily impartial critical and historical study of the Inquisition. Translated into English by a Paulist Father and published in New York with the approval of Archbishop Farley, it may perhaps be regarded as a semi-official statement.

The author is in no way an apologist for the institution of which he writes. It would be perfectly consistent, he thinks, for the Church now to denounce her older methods without any retirement from her claim to divine authority.

Her office on earth is to transmit to generation after generation the deposit of revealed truths necessary for man's salvation. That to safeguard this treasure she uses means in one age which a later age denounces merely proves that she follows the customs and ideas in vogue around her. But she takes good care not to have men consider her attitude the infallible and eternal rule of absolute justice.

She readily admits that she may sometimes be deceived in the choice of means of government. The system of defence and protection that she adopted in the Middle Ages succeeded, at least to some extent. We cannot maintain that it was absolutely unjust and absolutely immoral. Undoubtedly we have today a much higher idea of justice. But though we deplore the fact that the Church did not then perceive, preach or apply it, we need not be surprised. In social questions she ordinarily progresses with the march of civilization, of which she is ever one of the prime movers.

We are to conceive, then, of the Church gradually perceiving that her methods were barbarous and inhuman, and of her own motion abandoning them.

But that is not at all the picture. The abolition of the stake and the torture-chamber was forced upon her from without, by a public conscience which she had done nothing to awaken. She grudgingly followed, not led, civilization. When the times were cruel, she became cruel. Before that, when the times were tolerant, she was tolerant. After that, when public conscience awakened, her conscience awakened. She was the led, not the leader.

In the beginning, her own Fathers preached tolerance. Even Tertullian said:

It is a fundamental human right and a privilege of nature that everyone should worship according to his convictions. It is assuredly no part of religion to compel religion.

Origen, Cyprian, Lactantius and Hilary were also opposed to the use of force. There was even a proverb — *Ecclesia abhorret a sanguine*, the Church revolts from bloodshed.

The early emperors, Christians, after the Fourth century, did some persecuting on their own account. Heresy was more or less associated with treason, and the persecution was a political — even a police — rather than a religious measure. The Church was hardly yet educated to approval of it. Then it seems to have died away and on to the middle of the Eleventh century we hear little about it.

Then the Manicheans made themselves popularly obnoxious by some of their teachings and practices. The people themselves went so far in their persecution of the sect as to burn its propagandists at the stake. The civil authorities either winked or assisted.

Finally the Church began to be drawn in. Innocent III early in the Thirteenth century classified heresy with treason and assigned banishment and confiscation of property as its punishment. Then death was added for those heretics who resisted banishment.

When, finally, the Emperor Frederick had reviewed the legislation of his Christian predecessors of the fourth, fifth and sixth centuries, and had made the popular custom of burning heretics a law of the empire, the Papacy could not resist the current of his example. The popes at once ordered the new legislation rigorously enforced everywhere, especially in Lombardy. This was simply the logical carrying out of the comparison made by Innocent III, between heresy and treason, and was due chiefly to two Popes, Gregory IX, who established the inquisition under the Dominicans and the Franciscans, and Innocent IV, who authorized the inquisitors to use torture.

Now what of the Church's claim to lead civilization? In the early centuries the political powers tolerated any opinions so long as their expression did not lead to disorder nor their practical consequences to treason. Then the Church was tolerant. In the middle centuries, when cruelty was the popular expression of religious disapproval, the Church followed again and became cruel. In our own day toleration has returned and cruelty is abhorrent. The Church accordingly renounces cruelty. In matters of science the picture is the same. The pace has been forced for her, step by step, concessions slowly compelled one by one.

The Vatican is however now trying to do a little bit of leading — back to intellectual night. How much following there will be, remains to be seen.

### President Porfirio Diaz of Mexico

**P**RESIDENT Diaz has broken all records in the length of tenure of the office of Chief Magistrate in any Republic, for his fortieth anniversary of service in that capacity has just been celebrated. Those forty years have been noteworthy for uninterrupted advance. From being an almost negligible quantity in the eyes of the world when President Diaz took the reins of government, Mexico has become a powerful and progressive nation. Its advance has really been greater than that of Japan in the same time, because the previous condition of Mexico was far lower than that of the Island Empire. In Mexico the peaceful employments of trade, science, art, literature and all branches of modern civilization have moved forward with gigantic strides; the commercial prosperity is abounding and a large and cultured middle-class — the bulwark of a nation — has grown up. The arrogance of ecclesiastical tyranny has been destroyed and political and religious liberty firmly established. It is no wonder that the great man to whom all this is primarily due should have been unanimously re-elected time after time to the highest office in the gift of the people. He was intensely loyal to the noble and impersonal ideal of his life, the betterment of his people, regardless of personal aggrandizement in any form. He believes the republican form of government the most suitable for Mexico and he has never wavered in carrying out his principles with absolute honesty, courage, and firmness. His life is so full of thrilling romance and hairbreadth escapes that it seems

almost like a page from the ages of chivalry, and it has no stain.

The Governor of lower California, Mexico, wishing to send his congratulations upon this memorable occasion, took advantage of a courteous offer made by the commander of the U. S. S. *Minnesota*, then lying in Magdalena Bay, where the American warships are frequently to be seen for naval target practice. The *Minnesota* forwarded the message by wireless telegraph to the station at Point Loma, California; it was then flashed across the continent to Galveston, Texas, and thence to President Diaz in Mexico, a circuit of several thousand miles! The telegram read as follows:

SEÑOR PORFIRIO DÍAZ,  
Presidente de la República, Méjico.

Hónrome  
felicitar á Vd. por el aniversario 2 Abril 1867  
SANGÜINEZ  
Gobernador de Baja California. Abril 2, 1908.  
C. J. R.

### Clipped from the Press

THE San Diego Chamber of Commerce chartered a boat and took the party for a ride around the bay. At noon a lunch was served at Roseville Pavilion, and then we were taken in tallyhos to Point Loma Homestead, the central home of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, under the leadership of Mrs. Katherine Tingley. The pupils of the Rāja Yoga School had prepared a two hour program for us and Mrs. Tingley herself was present, and at the request of our President made an interesting talk. The exhibition given by the children was marvelous and we of the press certainly went away with a better understanding of this remarkable woman's great work.

—From the Report of the California Press Association's recent visit to San Diego.

THE San Diego *News* informs us that the young students of the Point Loma Rāja Yoga Academy have not been backward in doing their part to make the memory of the visit of the fleet to the Pacific Coast a pleasant one for all concerned, and in response to their efforts most cordial invitations were received from the Admirals and officers to visit the ships and be entertained on board. They carried them large baskets of flowers and literature published by the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY. The officers and men expressed gratitude for the literature sent to them while at Magdalena Bay by Mrs. Tingley. These young students to show their appreciation of the kindness and courtesy extended them, organized an impromptu concert and delighted all by their wonderful musical ability. One of the boy orators of the Academy made a stirring address on "The Higher Patriotism" which greatly interested and surprised the audience. To finish, the party gave three cheers for the President, the Admiral, the officers, the sailor boys, to which the whole ship's company responded with three tremendous cheers and a "tiger" for Mrs. Katherine Tingley and the Rāja Yoga Academy.—Petaluma, Cal. *Courier*, May 11, 1908

# Art Music Literature and the Drama

## Welsh Literature—Poetry—Fourth Article

**L**LYWARCH HEN. The chief interest in this poet must be that he was a greater master of style even than his contemporaries. He wrote a number of elegies, of which the best is that on his own sons, beginning: "Baglan bren, neut cynhauaf?" (O my crutch, is it not winter?) Although he wrote almost always in a vein of lamentation, his poems ring with a titanic suggestion of the potential greatness locked up in man, of the heroism which is greater than all obstacles and danger, even though these last should result in the hero's death. He pours strange and subtle light on the character of this or that man whom he is praising. "Am I not greatly invigorated since he came to be my son, and proud to have known him?" he asks, speaking of "fair Pyll, impetuous as a fire in a chimney." It may be worth mentioning that the name Llywarch Hen means the Ancient Radiance or Light-bringer, and that the sons for whom he made lamentation were said to have been killed while fighting against one Mwg Mawr Drefydd, the Great Gloom or Smoke of the Cities. Llywarch was a prince in Cumberland, and at the age of one hundred and thirty was driven from his kingdom by the Saxons, after all his sons had been killed. He made his way into Powys in Wales, where he was honorably received by the ruling prince, and where some of his finest poetry was written. At first sight one would perhaps say that no spiritual value could attach to a poem of lamentation in any case, and so pass by Llywarch as having contributed nothing to the stock of literature that shall serve some purpose in the world. Yet one is not quite sure. It is one thing to mourn supinely the harshness of fate, another to assert man's heroism in spite of it. The age was one of terrific sorrows for the Cymry; defeat, loss and lamentation were the atmosphere they breathed. It might have been something, to have rung out the principle of manhood, the note of the indomitable, in the very face of all these things.

**ANEURIN.** Aneurin's great poem, the Gododin, is by no means easy to understand. It is marked by the same lofty style as the work of the other three, and appears to relate to a massacre of Brython Chiefs by the Saxons at a banquet. It is a strange fact that of the four ancient poets, the last two alone have escaped all attacks from critics. Their work is allowed on all sides to be genuine. Of the four,

it is these two who do not profess to be mystical—at any rate not obviously mystical.

**CONCLUSIONS.** Applying the literary test still further, we may note these facts. The Sixth century was, as we have said, a time of great sorrow for the Cymry. The fate that has since overtaken the American Indians was staring them in the face, and there was no

saying that it could be averted. The burden of the work of Aneurin and Llywarch Hen was also sorrowful, and there is a note of sorrow in the poems of Myrddin; although he, through his mysticism, had foresight of a new Golden Age, and there is a strong note of joy in him too. These three are characterized by the same general majesty of style which also

marks the work of the minor poets of this time. Gwyddno Garanhir wrote a poem on the submersion by the sea of the Cantre'r Gwaelod to the west of Wales, which happened at this time; it begins, "Seithen-in—stand thou forth"; its manner is exalted and admirable, and it is an excellent example of Sixth century style. All this work is intelligible, or nearly all of it. With the Taliesin poems, however, we find a difference. They have an altogether more archaic feeling; so much so as to be only intelligible in parts, in flashes here and there. These flashes are commonly joyous, not mournful. The style is different from that of the others, is heightened even above theirs, we should say, and compares with it as a cavalry charge might with a march of infantry. It is therefore likely that they come from an even earlier age: taking what we can understand of them as an index to their general meaning, it is probable that they were part of the old Druidic sacred literature. H. P. Blavatsky quotes a couplet from one of them as a Druidic saying. In subsequent articles the great prose work of Welsh literature will be taken up, the Red Book of Hergest. This includes the Mabinogion (of which we have only Lady Charlotte Guest's translation) and the Arthurian Cycle of romances, so wonderful in their deeper interpretation and suggestion of the ancient Knowledge of the mysteries of life.

### Art for the Masses in India

**T**HE India Government School of Art in Calcutta recently held its first exhibition of ancient and modern Oriental paintings. A number of most interesting Chinese and Japanese paintings were loaned for the purpose by Indian families of culture and wealth and it is believed that an important step has been taken towards the revival of interest in genuine Indian art. The Indian Society of Oriental Art has for some time been working towards that end, believing that art may and should become a powerful influence for good among the masses. **STUDENT**

## ENTRANCE TO ISIS THEATER, SAN DIEGO

Decorations of pepper, marguerites, roses, streamers and the American flag, in honor of the Atlantic fleet

**N**O one can study ancient philosophies seriously without perceiving that the striking similitude of conception between all—in their exoteric form very often, in their hidden spirit invariably—is the result of no mere coincidence, but of a concurrent design; and that there was, during the youth of mankind, one language, one knowledge, one universal religion, when there were no churches, no creeds or sects, but when every man was a priest unto himself. And, if it is shown that already in those ages which are shut out from our sight by the exuberant growth of tradition, human religious thought developed in uniform sympathy in every portion of the globe; then, it becomes evident that born under whatever latitude, in the cold North or the burning South, in the East or West, that thought was inspired by the same revelations, and man was nurtured under the protecting shadow of the same **TREE OF KNOWLEDGE.**—HELENA PETROVNA

BLAVATSKY in *The Secret Doctrine*, Vol. 1, page 341

Io che da un altro sol più vaga aurora  
 Illustrata veda, con altro caldo  
 Da quel che i nostri fiori apre e 'ncolora  
 Tenni qui gli occhi fissi e 'l pensier saldo.—Vittoria Colonna

WHILE in Sweden last year Katherine Tingley was entertained, among other places,

at the beautiful home of Ferdinand Boberg, the great Swedish architect, whose wife, so justly famous for her paintings, is the daughter of one of the Leader's beloved students and a pioneer Swedish Theosophist, Mme. Scholander. In speaking of this visit later, the Leader said:

Ferdinand Boberg, the great Swedish architect . . . is helping to give to Sweden a new life, broadening out in his work, stepping beyond the limitations of modern architecture. In part his work shows a touch of our Point Loma architecture. In originality of conception and creative power he stands as it were between the classic and the modern schools. His wife, Mrs. Anna Boberg, a brilliant woman, is famous for her Norwegian paintings, and like her husband is original and daring in her work. Studying her paintings one senses the soul-touch in the realistic nature-life depicted on her canvas. Here again was evidence of the Theosophical spiritual life handed down from mother to daughter. Her mother was Madame Scholander. (From stenographic report of Katherine Tingley's lecture delivered at Isis Theater immediately after her return to Point Loma.)

It is to Mme. Scholander, one of our oldest members in Sweden, that we are indebted for the photographs of the cuts that appear upon these pages and it is a matter for sincere regret that we have not space for many others, so very strong and remarkable do they show the original paintings to be, so true in values, so daring and yet so uniformly noble in composition, so altogether worthy are they of being classed with the very strongest work that the present generation of women has done in art. And present-day work, some of it—indeed, most of it—is very strong and would seem to have taken descent straight from the art of old Egypt, Greece, the best of Rome and Middle-Age Italy, by no means from the gentle excellencies of Mme. Le Brun and Angelica Kauffmann. But that is another story,

## Sweden's Triumph at Venice

the story of the open doorways and unfolding opportunities of the present day, and cannot be touched upon here.

It is but a very few years since Mme. Boberg made her appearance as a factor in the art-world, having exhibited for the first time in 1904. This was in Paris and her then conquest of the art critics was confirmed by a second exhibition in the same city two years later. Of the sixty paintings exhibited upon the last occasion the French State acquired one and most of the others found their way

MME. ANNA SCHOLANDER BOBERG

into private galleries of France and other countries. Recently, in response to an invitation, she sent sixteen paintings to the International Art Exposition of Venice, Italy, and reproductions of two of them which were made for the Italian journal quoted below bear, following their respective captions, the significant words: *Quadro di Anna Boberg, esposto a Venezia ed acquistato dal Ministero della Pubblica Istruzione per la Galleria di Arte Moderna di Roma*, and *Quadro di Anna Boberg, esposto a Venezia ed acquistato da S. M. il Re*.

Strong and splendid as Mme. Boberg's work appears even through the somewhat thankless

medium of a small black and white reproduction, Katherine Tingley states that their real glory lies in

their color, in the living, glowing color-interpretation that is so often, though not always, born of a masterly handling of values. This we must trust to the reader's sentiment to supply. The product of no "school," exponent of none, Mme. Boberg is unique among artists, and Theosophists, who have long contended that the Art School tuition of the world far too often mistakes the *means* for the *end* of art, are doubly fitted to understand and appreciate her paintings.

From *La Donna*, an Italian paper, one of the Point Loma students translates the following, and the article must to women have an added interest because written by an Italian woman journalist.

### A Woman Artist at Venice

#### THE TRIUMPH OF MME. ANNA BOBERG

The visitor to the International Exhibition of Venice who, like myself, comes into the Swedish gallery after being half suffocated by the heavy air of the French section, is wholly revived and comforted. The simple, gracious elegance of the decorations and the sincerity of the work exhibited are like a breath of oxygen; and beyond doubt the most triumphant work there . . . is that of Anna Boberg. New to the Venetian Exhibition, this lady, still in the early years of her artistic career, gives us one of the most delightful surprises of the year.

All the poetry of the Polar lands is contained in a series of pictures which at first sight, and viewed as a whole, leave the impression of being dominated by the colors of the rose and the violet. Examined in detail, they make one pause in ever-growing admiration, transporting one to the unknown and only imagined regions of the North, among those mysteries of light and shade which the extremes of nature and atmosphere continually improvise among the torn and rifted rocks of the fjords.

Here are myriad swiftly-changing meteoric effects, rendered with incomparable technique; here are the mysterious shadows of night; mists from the sea of ice, veiling with their blue-grey dimness the brown reefs that await the advance of the waves;

white mountains shining up in the clear winter sky, and the aureate snows scintillating, adamant and intact, beneath the sun, which illumines, but cannot melt, their mantle of gems. And all is so deeply felt by the artist that we also are made to feel it; it is held up before us in her work by that magic of hers which makes her the devoted interpreter of Nature in the north.

In Mme. Boberg's picture, *The Approach of the Hurricane*, we are made to feel the grand silence, the shadow and piercing cold of the tempest; we feel the sacred awfulness of the Northern Lights, through whose momentary flashes is passing, invisible, some divine being; and the dark gold of the night diffused among the boats in the *Departure of the Fishing Fleet*. She brings to life the mythic poetry of the Vikings, conquerors of the sea, whose purple sails carried them through regions of fabulous sea-monsters beyond the confines of the world—thus the humble modern herring-fishers are transformed in what can only be called an evocation of golden legends and dreams.

What can be said of the daring and pagan beauty of the picture *Sunshine and Snow*, in which the glory of the golden air marvellously trembles between the snowflakes? Or of the deep and tragic suggestion of the *Churchyard* under the moon, by the dark waters of a marsh, with all its poor crosses abandoned and broken by the storms? Or of the astounding truth of the *Mountain, Through the Rain* which unlooses and spends itself over the sea?

Sky and mountain, water and snow, ice and sun, rocks and ships, sunlight and fog; in contrast, in combat, in harmony, in the superb and many changing play of invisible forces;—and over all a soul so fiery, so living and sincere that the more one sees of these wonderful landscapes the more one is subdued and convinced.

Who would guess from her splendid and daring works that this great artist is a vivacious little woman, her face bearing the stamp, one would say, rather of a Latin than of a Northern race? We are wont to imagine the women of her country as being of a calm and placid temperament; instead of which, as those who know her in Venice tell me, and as the pictures which illustrate this article as well as the gracious words from her that came with them when she sent them to me, reveal, Mme. Boberg, so virile in her daring, advances in a light of gracious womanliness, full of nervousness, vivacity, ardor, all the characteristics of a fiery and enthusiastic temperament which, however, does not exclude the northern gift of firmness.

Artists and critics, as is their custom when the work of a woman rises above the level of what is expected of women, have said that Mme. Boberg has "masculine genius"; and this is true, if by "masculine" is meant that which shows a tenacity, fervor and skill to which women can rarely rise, still shackled as they are in their intellectual expression by hereditary ideas and customs, and being by their very mode of life less free than men. But circumstances have favored this marvellous woman, whose work is such that many of the most famous artists may envy her. Wife of the well-known architect, Ferdinand Boberg, . . . she was, until some few years ago, engaged solely in decorative work and in water colors. It was during a pleasure trip in Lapland that chance threw her among the islands of Lofoten, where was revealed to her the inspiration of that strange phase of nature which made her an artist.

Like all the greatest and most sincere artists, Mme. Boberg is self-taught; she has not studied art in the academic sense of the words; she has

learned next to nothing from the professors or in the schools.

"After my first visit," she writes to me, "I was enchanted, I was to be forever the captive of this scenery, which I judge to be unique, the grandest in the world. Where else can one find islands which rise sheer from the ocean, covered with snow and ice, and gradually die away in the warm, never-frozen waters of the Gulf Stream? Where else do the ships of the Vikings remain intact after the passing of eleven centuries?"

"The moment I saw that country I knew it was a rediscovery of the land I already knew and loved best in the world. I had lived before the hard life of the fisher folk; and although it gave me new and strong sensations I had never till then experienced, I felt suddenly at home, undisturbed by cold, hunger, or an absolute lack of the most primitive conveniences of life."

The Lofoten islands are at the extreme of the

From one moment to another the landscape changes; storms burst suddenly without any warning, fogs almost palpable in their density hide the world away in an instant. . . . Therefore do you think that the *métier* of an artist can be exactly an easy one?"

Not easy, no, but a direct inspiration from the soul, stronger than any hardship; art true and vibrant stamps the work of this most valiant woman with its own inexpressible magic, so that, quite apart from her life, which in our country reads like a novel, a phantasy, her paintings speak a language which goes down to the heart and awakens the soul, the divine language of poetry.—*Enrica Grasso*  
A LOMALAND STUDENT

### A Congress of Italian Women

THE following was sent from Rome to the New York *Evening Post*. Italics mine. STUDENT

Marcus Aurelius, the philosopher emperor, whose

PAINTING BY ANNA BOBERG

Fishing boats assembled in harbor at Lofoten before the opening of the fishing season in February

known world, face to face with the icy mystery of the Pole, inhabited only by a few poor fishermen whose lowly cottages are hidden away in the depths of the fjords. On one of these rocks Mme. Boberg, whose home is in Stockholm, has built herself a tiny chalet close to the sea, which serves as a summer studio from which she makes excursions lasting whole weeks at a time, cruising around the islands in a little sailing-boat which she poetically calls the *Viking's Ship*, scaling the mountain heights unencumbered except by her artist's equipment, sleeping when and where she can, preparing her own food of the fish she catches and the seagulls' eggs she finds.

The joys and difficulties of art are mingled for her with the pleasures and hardships of a half-gypsy life entirely beyond the pale of the commonplace. The dangers, the difficult ascents, the excessive cold of the polar regions have no terrors for an artist who, in order to catch the swift effects for which her pictures are so much admired, goes out in all weathers, in the rain, in the snow, in the fogs and in the darkness of night, and is obliged, while at work, in order to conquer the fearful cold, to dip her hands in freezing water; as of course the wearing of gloves while she works is impossible.

Once more I give her own expressive and concise words:

"It is the land of extremes. In no other place are the calms so absolute, the storms so terrific. The sun shines at midnight, and it is night at noon.

statue dominates the Roman capitol, surely smiled down with more gentle irony than common on Thursday, April 23, from the elevation of his golden steed, as he beheld thousands of women of all ages, clad in varied costumes, ascend the steep corded stairs that lead to the Piazza del Campidoglio.

Surprise, too, could be read upon the faces of the municipal guards, the scarlet costumed *Donzelli* of the Roman municipality, who, in gala dress and with drawn swords, lined the splendid marble stairway that leads up to the Capitoline rooms, as they beheld these precincts sacred to the male sex invaded almost entirely by the female.

Here in the room known as that of the *Horatii and Curatii*, was inaugurated, in the presence of Queen Elena, the Princess Letitia, the Roman Syndic and the minister of public instruction, the first National Congress of Italian women.

Although isolated groups had been working for the amelioration of woman's lot in Italy ever since its political regeneration, it was not until 1898 that a real feminist movement made itself apparent. In Milan was founded the *Unione Femminile*, which now has more than 100,000 members. Turin followed suit with that splendid society now ramified all over the peninsula, the *Co-operative Feminine Industries*; Tuscany, the Romagna, the Emilia, took up the example, until there exist now some twenty different sections, all helping forward the social and ethical uprising of the land. It was to bring together these sections...this Roman Congress was called.

# OUR YOUNG FOLK

## Children's Festival at the Râja Yoga Academy, Santiago de Cuba

IN the well-organized Râja Yoga Academy which was established in this city by its benefactress, the magnanimous Katherine Tingley, a brilliant festival was held last Friday evening, which was attended by the parents of the pupils.

There is no doubt that the teachers of Râja Yoga possess the true spirit of instruction. They are so closely in touch with the children whom they are guiding along the path to supreme goodness with perseverance, ability, love and joy in their work; that one can see in the school a most admirable discipline and order, even among the very little children, whom all teachers are not thus able to direct with such care and skill.

There were star-like groups of tiny children executing difficult movements in military drill and intricate calisthenic exercises, led by a child a little older. Such training proclaims the expert teacher, one well-versed in the secrets of the science of pedagogy, and endowed with a patience and perseverance not only difficult to find but very rarely existing in the vast legions of those who are engaged in the education of the young.

There were also children of eight and ten years who delivered speeches in English and Spanish with readiness, frankness and ease, winning the entire good-will and approbation of the large audience.

Another typical feature of the Râja Yoga instruction is that of civic and moral training. Râja Yoga trains the heart of the child; inculcates a sense of patriotism and veneration for the heroes of the country; and cultivates those seeds of pure goodness which will unquestionably bear fruit in benefits to family, society and country. This is the complete program of the festival:

### PROGRAM

- |   |                        |
|---|------------------------|
| Song of Greeting                                | Selected               |
| GENERAL CHORUS                                  |                        |
| Classes in Geography, Arithmetic and Reading    |                        |
| TINY TOTS OF GROUP FOUR                         |                        |
| Piano Duet                                      | "Barcarolle"           |
| EMILIA MOYA — ANGELITA PLANOS                   |                        |
| Speeches:                                       | "San Juan"             |
| MARIA VICTORIA GÓMEZ                            |                        |

### ORCHESTRA PRACTICE AT THE RÂJA YOGA ACADEMY, SANTIAGO DE CUBA

Motion Song: "Three Little Heads in a Row"  
SPECIAL CHORUS OF TINY TOTS

Military Drill, Directed by  
ENRIQUE COLUMBIÉ

Marching Song: "The Crusaders"  
GENERAL CHORUS

The work of the Râja Yoga teachers is worthy of all praise inasmuch as they dedicate their whole lives with love to the difficult task of teaching and for this reason we offer them, with all sincerity, our best wishes; which we extend also to Mrs. Tingley who has given to Cuba so meritorious and beneficent an institution.—Translated from *La Prensa*.

### A Plant's Obligations

THERE is one habit which human beings would do well to learn from the nature-fairies and that is, making the best of what they have. When the rain has softened the soil and the warm sunlight is calling, each and every seed that possibly can, bursts his shell and begins to grow. It does not think whether it has enough earth to grow two feet high, or two inches, it does not calculate how much rain there is likely to be; it just takes what it has and makes a start. Whether it is able to become large and robust or is obliged to remain small and thin does not worry it in the least; all it is concerned with is to use what is within reach. If it could speak it would probably say, "It is no affair of mine. If the king of my species wants me to be larger he must give me more to grow with. All he expects of us is to use what we have as well as we can, and I have done this. I am

very small, it is true, but every leaf is healthy and every blossom—I've only one—is of perfect form. I don't see what more any plant could have done."

So his little elfin conscience is clear and he is as happy as his big brother over in the garden. That is how the family makes its way, by attacking every possible point. If some lucky accident gives one place a little water a plant is there to use it and, growing up taller, yields enough seed to replace its less fortunate brother.

This is a good lesson for each of us to learn; to be always "ready and watching" as Jesus said, so that if any opportunity comes our way we can seize it and become that much better fitted to do our work in the world when we have a chance.

RALPH WYTHBOURNE

THE rules of harmony were first formulated in modern times by Hucbald, a Flemish monk, who studied the musical system of the great Pythagoras. This was one of the initial steps in the progress toward the modern art of music. A system of notation was very slow in developing and the use of a staff of four lines with spaces was not introduced until the first half of the eleventh century. It was the contribution of Guido of Arezzo. The formulation of the rules for measure was the work of Franco of Cologne, who was living in the year 1200. With the rules of harmony and measure formulated, and a system of notation ready for use, whereby music could be preserved in writing, the way was opened out for musical composition.

O. W.

# THE CHILDREN'S HOUR

## A Letter from an Old Friend

**D**EAR Children:  
How time flies!  
It is now long ago that I wrote you a letter in the CENTURY PATH. I told you then how Meg, my wife, and I first got acquainted with the Râja Yoga children, and how we moved to Point Loma. Many things have happened since then. We have many children now, and Meg and I are grandparents.

I was a bit afraid that when we got our grandchildren Meg would be very proud, and I dislike pride; but no, she bore the great honor like the good little pigeon she is. Only time and again she used to say,

"Peg! Why do you not take your whole family out for a fly? I am sure that the Râja Yoga children would like to see our grand-pigeons."

Somehow I forgot. Then Meg said one day: "Peg! You ought to have a family picture taken. Let us take our whole family and fly for a visit to the Râja Yoga flowers. I feel that they are waiting for us. Perhaps one of those artists will be passing by and when he sees our grandchildren he can not help wanting to take their pictures."

Well, we went, all of us; and as you see, we had our pictures taken with some of the Râja Yoga tots, who are our special friends.

I must tell you how we first became acquainted with the tots. One day as Meg and I and some of our children were sitting on the roof, Meg said:

"See, those Râja Yoga tots are motioning us to come and have crumbs. Do you think we had better fly down to them?"

"No," said I, "it would not be good manners for a well-bred pigeon to go at the first invitation."

"Pigeon talk!" she said; and down she flew, followed by the children. Being the father of the family, of course I had to fly down also. The Râja Yoga tots told us their names. I introduced our family:

"This is Meg, my wife; here are our first twins, Tip and Tripp; these are our second twins, Bill and Pill, and I am Peg, myself."

I do not know if they remembered our names; but certain is that when we came back on the roof we had already forgotten theirs.

"It will never do!" Meg said. "People are very particular about their names. You should have remembered them, Peg! I had too much in my head, thinking of the child-

THE RÂJA YOGA TOTS AND THE PIGEONS

## BE CHEERFUL

**C**HERISH this as sacred writ—

Laugh a little bit,  
Keep it with you, sample it,  
Laugh a little bit.  
Little ills will sure betide you,  
Fortune may not sit beside you,  
Men may mock and fame deride you,  
But you'll mind them not a whit  
If you'll laugh a little bit.—Selected

ren's manners, the first time they have eaten in society. Do you not even remember one name?"

"I am afraid not, Meg," I said; "but I am quite sure I heard some flowers named, but which ones I cannot say."

"Then all will be well," said Meg. "We can easily see which ones will fit."

"The first one we shall call Daisy; the second one Carnation. What shall we call the third one?"

"Dahlia," suggested I.

"Dahlia has no fragrance; it will not do," said Meg.

"Sweet Pea, then."

"Yes, that is good. Do you remember to keep account on your toes, Peg?"

"The fourth we shall name —"

"Brown-Eyed Susan!" exclaimed Tip.

"Do not interrupt your father when he is counting!" corrected Meg.

"The fourth — Pussy Willow," I said.

"O, Peg! That will never do! No, Morning-glory is her name. The fifth, Heliotrope."

"But Meg! Is not that name too long for such a little girl?" I remarked.

"The flower who bears it is still smaller," answered Meg, "and it has such sweet fragrance and its name a beautiful meaning.

The sixth we shall call Mignonette. I am sure she is like that flower, who is so simple and modest, hidden among the green, but filling the whole garden with the very sweetest perfume."

"Now there is only one left," said I.

"That one we shall call Sunshine," said Meg.

"But that is not a flower," said I.

"There must be sunshine among flowers," said Meg; which I admitted to be true.

"O, mother!" cried Tripp, "no one is named Violet!"

"True," said Meg, "how could we forget? Now it is too late. We shall save Violet for the next Râja Yoga tot that we find whom it will fit as a name. YLVA

## Find Treasure That Ye May Give

**I**WISH that I could make others happy!" sighed a girl. "You can, my child," said her godmother.

"How can I," grumbled the girl, "when I have no happiness myself."

"Now, my child," said the godmother, "you go every day to the kitchen to help to prepare the meals for the family. Suppose that one day you were sitting before the kitchen fire with your hands folded. On the shelves and in the bins there were stores of rice, beans, flour, sugar, salt—and you sighed: 'I wish that I could give food to the people, but how can I when I am hungry myself?'"

"Would you not say to yourself: 'Arise and prepare the food for the others and they and yourself will be fed?'"

"Arise and prepare happiness for others from the stores in your heart, then you yourself will feel happiness in abundance." AEA

## Wasps to Make Paper

**T**HE wasps were the first paper makers. It was by watching these insects that man got the idea of making it. Now a man in Texas has the idea of teaching Mr. Wasp to make paper for him and he expects to train a large number of wasps to make a business of it. He has invented a curious little compartment into which the wasps must learn to put the wood-pulp they gather so carefully every day. Of course wasps cannot make a very great quantity, but what they do make is of very fine quality, and the man in Texas is preparing to train millions of wasps and he hopes to get ten tons every day in summer. Wasps do not work in winter. E.

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

**Do the Leaders of Science Know More than They Give Out?**

with the leading scientific circles, and that its comments and criticisms on the most up-to-date discoveries and theories are arousing thought in representative scientific minds.

The attitude of the CENTURY PATH towards science is sympathetic and appreciative; except, of course, in so far as the name of science may be used to cover views which the CENTURY PATH considers to be erroneous and misleading—as, for instance, views that favor an animalistic conception of human nature, a materialistic conception of the universe, or a too dogmatic attitude towards matters outside the scientific domain.

In such cases the CENTURY PATH, as the champion of Theosophy, does its best to combat such views by pointing out their error in a manner as impersonal as possible.

**Discord Between Private and Public Teaching**

Occasionally our scientific readers finding themselves unable to deny the reasonableness of the criticisms, will admit that the views criticised do not represent the latest opinions of leading men of science themselves, and will plead that our remarks do not apply and are out-of-date. The CENTURY PATH, however, is not unaware of the fact that many of our leading men of science personally hold broader and more advanced views on many matters than those which pass current in public as authoritative and representative. Hence its criticisms must be regarded as directed not against these personal views held by the scientists, but against the views which gain ground in the arena of public opinion as being the most up-to-date pronouncements of science. The remedy for scientists, should any feel aggrieved, is to make public those more advanced views which they claim have rendered our criticisms out-of-date.

Meanwhile the CENTURY PATH, however well it may be informed as to the more advanced private views of men of science, must of course continue to occupy itself with such views as are before the public today, even though these views may be considered by the scientists themselves as obsolete. For it is with the arena of public opinion that the CENTURY PATH is concerned. It is bound to oppose views which it considers erroneous and misleading, and if its criticisms unwittingly reflect discredit upon the name of science, it stands ready to help the scientists in convincing the

**A Science Afraid of Itself**

public that these views are not authoritative, and in proclaiming the real views.

A little consideration is due to a critic for the difficulty he often experiences in pinning down his opponents to a definite expression of their views. In the case of religious authorities in particular this difficulty is met with. Combat the misleading errors which gain ground under the name of religion, and the clergyman will tell you that that is not what the church really believes; and he will perhaps proceed to avow opinions the most broadminded, with which the Theosophist

**A Church Afloat**

can have no quarrel. Nevertheless the Theosophist must oppose whatever false views he finds floating in the public mind; but he will be only too glad to exculpate the church by giving publicity to its actual views.

Hence it is not safe to assume, because the CENTURY PATH often assails views which some leading scientists say are out-of-date, that it is "not aware" of any later and revised views. It is in all probability aware of them, for it consults the latest available published pronouncements, and keeps itself up-to-date in every department of human interest so far as accessible to the public. It assails those views which gain ground among the public, which often claim the highest and most recent scientific authority, and which influence the mind of the people, but which the Theosophist, nevertheless, can only regard as erroneous. The CENTURY PATH is flush with the times; and if the leading scientists are personally ahead of the times, it is for them to show it. The CENTURY

**The World Demands Sincerity**

PATH stands ready and willing to consider the more advanced views of scientists—those which have superseded the published ones—but not so long as these views are kept private; for there is no time to waste in commenting on matters that are not before the world.

Finally, then, one would ask the scientists what attitude they propose to adopt. Do they intend to pose as knowing a few things of which the CENTURY PATH is "not aware"? If so, then of course they have us at a disadvantage; for how can we be expected to know what they may have up their sleeve? Or on the other hand do they mean us to regard their published (or at least accredited) utterances as representative of their views? The CENTURY PATH is ready to accommodate itself. It is ready to tell the public all that it can find out about the most up-to-date opinions of scientists, and will gladly assist science in the work of dispelling popular delusions

as to what it really teaches. The public ought to know that science has this esoteric circle wherein are held views *not in conflict with Theosophical criticism*. In return, Theosophists will be glad, whenever they may be compelled to assail some "out-of-date" dogma of current science, to have the support of those in touch with the inner circles in proclaiming the real views instead. STUDENT

### The Real Buddhism

A YOUNG Buddhist monk, a transformed Englishman, has just arrived in England, prepared to offer the one solution for all the perplexities now lying upon Western hearts and minds.

The troubles, he truly says, are due to individualism; but he does not define. There is one kind of individualism which is the cause of all human pain; there is another which is at—nay which is—the root of human being. Let the individual—in the former sense—get into this individuality of him—in the latter sense—and the perplexities of life disappear; its meaning lies clear before him; he understands what is right action and what right feeling.

If this following remark of the monk's applies to the former, which is a disease of consciousness, he is telling nothing but the truth:

Buddhism, then, with its central tenet of non-individualization, is capable of offering to the West, to England, an escape from this curse of Individualism, which is the deep-rooted cause of the vast bulk of the suffering of mankind in Western lands today.

But he proceeds to show that he has not understood real Buddhism, Buddhist as he calls himself; that he has not sounded his own consciousness deeply enough to warrant his taking up the position of teacher; and that in thinking his prescription may ever become acceptable, he has not understood the Western mind. He says:

Buddhism, and Buddhism alone, denies the existence in man of an immortal ego, a Soul or Self separate from that of his fellow-creatures. Buddhism, and it alone, teaches that this doctrine of the Selfhood, this belief in the paramount importance of an interior individual being, is the deepest and direst of all the many illusions whereby our ignorance deceives us.

There is a self in man whose one purpose and idea it is to serve itself. There is another self which, when fully found, reveals that its one purpose and idea is to serve others, other men and all that has life. Being itself life itself in divine self-consciousness, it desires that all other units of life shall come to its state of clear and perfect knowing. In other words it loves, in the noblest meaning of that word, would fain forever *give* and call upward and help and illuminate. No one who has ever meditated deep into himself but knows that he is beginning to come into the presence of, and bring into his own presence, and unite himself with, this self. It is a fact in consciousness known to every real mystic who ever lived; and a mystic proper is but one beginning upon, or finally master in, the science of the soul.

Now Buddhism teaches all that.

To set doubts at rest, in the year 1890 certain Theosophists sought and obtained an in-

terview with the highest living exponent and practitioner of Southern Buddhism, the Ceylonese High Priest Sumangala. He is, we believe, yet alive. The interview was published, as he knew that it would be; and as he has never criticised or repudiated it, it stands. Says the reporting interviewer (in H. P. Blavatsky's magazine *Lucifer*, Vol. 6, p. 149):

Was there [he asked the High Priest] any ground for believing that the doctrine of the "Higher Self" or "Transcendental Subject" met with an express recognition in Southern Buddhism? . . . It is because they have failed to detect the traces of the Higher Self doctrine in Buddhism, that the Orientalists have not unnaturally come to regard the whole law of Karma as a poetical and "airy nothing." Rhys Davids, in the course of his interesting and eloquent work on Buddhism, furnishes a typical instance of this blundering. Confronted with the uncompromising teaching of Buddha to the effect that personality, *i. e.*, the conditioned terrestrial subjectivity of man [the self which clothes, obscures, but may look up to and merge in, the divine self] is illusive and without permanent ground in reality, and lacking the true key to its interpretation, he . . . etc.

The reporter then goes on:

It was therefore with no small sense of satisfaction that I was able to extract from the High Priest the admission (a) of the reality of this overshadowing Soul or "True Self," never realizable under the forms of the empirical consciousness [because the latter, unless in meditation it can get beyond its common scope, is conditioned by the limits of the brain]; (b) of its capacity to retain and store away the aroma of the experiences gleaned in incarnation [it is in this real Self that lie the memories of all our former lives, and by union with it we come into heritage of them]; (c) of its direct manifestation as intuitive wisdom in the higher states of Dhyāna [meditation or exalted prayer]; and (d) of its ultimate passage into Nirvāna on the break-up of the groups of causally conditioned Skandhas.

Skandhas are the elements of brain-limited mind and feeling, elements concerned with purely terrestrial and personal matters.

Mr. Eitel, the Sinologist, says:

Positively they [the Buddhists] define Nirvāna as the highest state of spiritual bliss, as absolute immortality through absorption of the soul into itself, but preserving individuality so that, *e. g.*, Buddhās, after entering Nirvāna, may reappear on earth for the help and teaching of men. That individuality—the higher, divine—is never lost, is the teaching of Theosophy and of Buddhism.

We say therefore that this young monk now in England does not understand what he has come to preach. And he has not realized that dark as may be the Western consciousness it is not so dark as not to know of an indwelling divine self and presence in its own midst. It is only rejecting religion and wandering far and foolishly afield because the current religion, as commonly preached, teaches nothing which gives it real light upon this profoundest fact of human life. It will listen eagerly enough when there are some who can prove by their lives, by their words, and by their spiritual influence, that they have stood in the presence of their own souls, and are able to radiate its message. To the extent that any now do this, do they have their audience, and such men may arise in the ranks of any of the world's great religions. STUDENT

### The "Missing Link" Again

AT the annual meeting of the American Philosophical Society Dr. Spitzka pleaded for an expedition to the Andaman and Nicobar Islands, in the Indian Ocean, to study the brains of the natives, who, he said, are the only survivals of the "pure ape stock" from which sprang the human race.

Theosophy teaches that they are nothing of the sort. They are degenerate Lemurians, final representatives of the humanity that inhabited the vast sunken Pacific continent, a continent which, stretching eastward from Africa finally extended to the west of America. It was at a point in the history of this race—a race separated from our own by another vanished humanity, the Atlanteans—that the ape diverged from man, not *vice versa*. For more than one reason the human and human-ape remains of that immensely distant time may never be found. The human body was not then chemically or physiologically identical with what it is now. It was of a higher order of substance, not such as would yield any fossil remains save by chance infiltration and concretion by some mineral matter soon after death.

But the Lemurians, like the Atlanteans, intentionally left their signature on the earth in more than one way. According to Theosophy, the Easter Island statues were the work of their descendants and in their own image, done in lava so as to last. And they have survived three submergences, whatever science may now think. Exploration in the substance of the platforms beneath these statues might possibly yield interesting results. STUDENT

### Wild Theories About Shifting Pole

A PRESS dispatch says that a man has a theory that the north pole is shifting and the climate consequently changing; for which he is gathering evidence in Alaska. It seems to one, however, that it is unnecessary to go to Alaska to find out whether the pole is shifting. Other places besides Alaska have latitude, and if that latitude changed in the minutest degree, the change would be found out at once. In fact it has been found out that the poles of the earth shift (with regard to their position in the earth itself) by a slight periodic but complicated variation, amounting, however, to only 30 or 40 feet. This affects the latitude of places to an almost inappreciable extent and the effect is not cumulative; needless to say it is totally insufficient to affect climate. The theorist also talks about the ice-cap, which he supposes to cause the shifting; and even expresses concern about the integrity of national boundaries fixed by latitude! E.

### The Production of Radium

THE Academy of Science at Vienna has just made the largest quantity of radium yet produced—forty-six grains. Ten tons of uranium and pitchblende, given to the Academy by the Government from its mines in Bohemia, were used in its production. The Academy will present a small fraction of the radium to Sir William Ramsay, the well-known English scientist, for experimental purposes. It will use part of it to test Professor Ramsay's theory regarding the effect of radium in producing transmutation of other elements.—*The Engineering Times*, London.

Thus science, like music and the arts, continues to grow more international. J.

# Some Views on XXth Century Problems

## The Alleged Ignorance of the Ancients

OUR popular guides, the scientific magazines, seem occasionally to be enlisted in a sort of crusade to belittle man, his history, achievements, and possibilities. Not content with ignoring the consciousness and intelligence immanent in all nature, and with endeavoring to reduce everything to mechanical-chemical phenomena, they are as it were obliged to maintain this position by positing the low intelligence of our ancestors a few thousand years back. Were they even successful in this, the attainments of the present in art, music, poetry and science would be more, rather than less, difficult to account for. Thus a recent writer in Germany is found saying, in reference to the Great Pyramid:

As the oldest known mathematical treatise, the Rhind Papyrus, written about 1500 B. C., contains only the merest rudiments of arithmetic, it is not likely that the Egyptians were familiar with advanced mathematics a thousand years earlier.

This is placing the date of the Great Pyramid rather more than four thousand years back—only. Well, if at that time, thirty-four centuries ago, only the rudiments of arithmetic were known, then, by the laws of probability—plotting our intelligence as a curve from the present back to the time of the Alexandrian schools, thence to 1500 B. C. and continuing the same curve to 2500 B. C.—we should find that the builders of the Great Pyramid must have known less than nothing about the simplest elements of arithmetic, and that forty-four centuries ago man's intelligence was considerably lower than that of a common garden bee!

Suppose we were to try to arrive at this curve of intelligence in another way. We may recall Plato's reference in the *Timaios*:

The transactions of this our (Egyptian) city of Sais are recorded in our sacred writings during a period of eight thousand years.

and another passage in Herodotus:

The Egyptians assert that from the reign of Herakles to that of Amasis, seventeen thousand years elapsed. (lib. ii, c. 43.)

The date of the Great Pyramid, which not only symbolized the creative powers of nature, but also illustrated the principles of geometry, mathematics, astrology, and astronomy, besides serving more important purposes, is very much farther back than our modern archaeologists are yet willing to admit, although Bunsen conceded to Egyptian civilization an antiquity of twenty-one thousand years. *The Secret Doctrine* warrants us in stating that the Great Pyramid dates (at least) from a time when *Alpha Polaris* (the Pole-star) was at his lowest culmination, and the Pleiades were on the same meridian, 31,105 years ago. In the time of Herodotus little remained of the once glorious Thebes except Karnak, even then falling to ruins. H. P. Blavatsky writes:

He must be indeed devoid of the spiritual perception of genius who fails to feel as well as to see the *intellectual grandeur* of the race that planned and built it.

These vestiges of a mighty civilization belong to a period to be counted not by thousands but by tens of thousands of years, and it is admitted by competent archaeologists that the farther we go back the greater the perfection of workmanship. And if in the face of facts like these we are invited to believe that three thousand years ago the Egyptians had only a rudimentary knowledge of arithmetic, we should either have to imagine a singular degeneration, or else to suspect that there may be some things about rudimentary arithmetic, hinted at by Pythagoras, the meaning of which is lost to us.

We should be careful before attempting to trace this curve of human intelligence, even on an arithmetical basis, to avoid radical error. For when we remember that in the schools of Thales and Pythagoras the doctrine of the true motion of the earth, its form, and the whole heliocentric system were taught 700 B. C., while a thousand years later we find Lactantius, the preceptor of Crispus Caesar, teaching his pupil that the earth was a plane, and warning him against the heretical doctrine of the earth's globular form, we may perhaps begin to suspect that we made a radical initial mistake. We may even suspect at last that the curve has been one of *descent*, not *ascent*; and that where we creep the ancients soared in their knowledge of the times and cycles of celestial movements. Where our calculations falter in determining the exact duration of one precessional cycle of twenty-five thousand years, their calculations took in periods so vast as absolutely to overwhelm the imagination, and were withal, of surpassing accuracy in detail, as conclusively shown by Bailly in his *Traité de l'Astronomie Indienne et Orientale*.

And so our popular instructors might ponder a little on the fact that

So far as human intellect can go in the ideal interpretation of the spiritual universe, its laws and powers, the last word was pronounced ages since.

It remains for us to recover it. STUDENT

## The Flockless Pastors

THE churches of Europe are feeling "serious alarm," summarizes the *Literary Digest*, over the growth of secularism and the neglect of Christian worship. Thus

We are told by the religious press of Germany that the Evangelical Church is losing its hold upon the people, and Pastor Ernst Bunke writes in the Lutheran journal *Reformation* (Berlin) that more than 12,000 defections took place in the year 1906 over the whole country, and in 1907 in Berlin alone there were 4000.

Preaching in the New York Fifth Avenue Baptist church recently, the Rev. Charles F. Aked declared that the church throughout the world is not in touch with the times. Dealing with his own denomination in particular he showed that

the increase in the Baptists of America has only been equal to one-fourth of our birthrate, proving that three out of four of our young people fall away from us.

The pastors attribute the phenomenon to various causes, to anything but themselves. Pastor Bunke writes:

As far as concerns Berlin those who turn their backs upon the church may be divided into two classes. One class consists of those who do not possess any religious cravings, the other of those who desire more than the church can give.

The first class, it seems, tends to dabble in various forms of socialism; the second tends towards the varieties of religious freakism and to follow charlatans. For the first class "the only cure" is to "make church life more sociable."

If everybody could produce on instruments, or in the chambers of his own imagination, as good music as anybody else, no one would go to concerts. The claims of the musicians to be able to provide some special thing would be either openly scouted or disregarded. But we now accord to the real composers their status because they prove their ability to enter a world or degree of consciousness not open to the rest of us, and to bring out from thence for our profit what they have found there.

Perhaps about the same proportion of people wants religion as wants music; say nine out of ten. The one is as natural and instinctive a want as the other; it may even be a very closely related want, a variant. The lamenting pastors will hardly say that the desire for religion is *not* instinctive. Indeed so instinctive do they admit it that they represent the people as inventing substitutes.

Are not the pastors somewhat in the position of men who should claim the status of musicians without having given any evidence of ability to compose, any evidence of possession of keys to a door in consciousness closed to others? The people feel that their pastors do not *know* anything particular, cannot call spiritual rain from any heaven.

The philosophies of the day dispute whether there is or is not a transcendental self or ego in man behind the mind—in other terminology, whether there is a soul. The less cultured pastors do not even understand the problem and attach no real idea to the word soul when they use it. The more cultured read the philosophies and attach themselves to one or another.

Yet the question is only one of thought-out philosophy for those who have not disciplined themselves to *know*, who have not reached that self and worked out for themselves in direct vision its relation to the mind or "empirical" self. The higher musicians are nearer the knowledge than the pastors, for the light that they *hear* streams into their "empirical" consciousness direct from that "transcendental ego." Meditation or real prayer is the same straining upward or inward—and to the same place—as is done by great musicians in their highest moments. The light constitutes a message, in the one case to be translated into and given as music, in the other as spiritual teaching and inspiration. It is because the pastors cannot give that translation that the people tire of them. STUDENT

# Archaeology Palaeontology Ethnology

## Mexican Pyramids

A REPORT which mentions the finding of two diminutive images carved from pebbles, in the pyramids northeast of the City of Mexico, goes on to say that few people are familiar with these Mexican pyramids. They are of great size and similar to those of Egypt. The Pyramid of the Sun is 700 feet square at the base and 250 feet high; and series of stone steps lead to the top. They are supposed to date back thousands of years, long before the Toltecs inhabited Mexico.

We should indeed pay more attention to the antiquities of our own continent—to these very ancient monuments, not merely to the bones and kitchen heaps of barbarians or the fossils of animals. Archaeologists are very apt to forget the existence of them, and of others in other parts of the world, when making theories which would be confuted by these testimonies. It is evident that parts of these western continents were inhabited at one time by pyramid builders similar to those of ancient Egypt.

The pyramid is described as the fundamental element of construction throughout Mexico and Central America. It was circular or quadrangular, plane or terraced, and of brick, earth or stone. Sometimes it was solid, sometimes it enclosed chambers. The pyramid of Cholula covers 44 acres and is about 200 feet high. At Mitla, in some of the buildings, are blocks of granite 16 and 19 feet long. The sculptures on this hard material are elaborate.

But this is not the place to give minute particulars which can be gleaned from current sources of information. They ought to be read about more. The question is, What does it all imply?

The custom of building pyramids and temples of enormous stones, carved with symbolic figures, was derived by the craftsmen from the same source as the craftsmen of Egypt—from the single race of which both were the offshoots. The remote history of Old World and New goes back to times when there was no Africa nor America, but a continent where the Atlantic now surges. STUDENT

Lomaland Photo. and Engraving Dept.

## OLD MEXICAN STONE AND POTTERY WORK

clays molded into many devices, and sometimes glazed and rebaked.

The Mexican Indians are as remotely removed in time from their origin as are the modern Asiatics from theirs. We can trace their history dimly through various invasions, but that it goes much further back is shown by such facts as their possession of calendars, civil and ecclesiastical, which are constructed on a highly complicated and apparently arbitrary plan, and which yet closely resemble calendars known to the Eastern Asiatics. This shows a common origin for the two races; though their connexion did not occur within recent times by migration across the ocean, as some think, but dates back to far older times when there was land communication. E.

## The Depreciator

THE CENTURY PATH has often protested against the practice of judging all antiquity by our own standards, which often results in detractions that are more disparaging to the critics than to the criticised. An over-zeal in depreciating evinces a sour and disappointed frame of mind. Along with this we find its natural counterpart, the tendency to overrate; and both of these extremes invalidate sane and sound judgment.

The London *Spectator* says:

The Wall of Aurelian is a standing protest against the sweeping generalizations of hasty historians.

It appears that this wall is being destroyed. Already the municipality has made four "unnecessary" breaches in it, and is now making, or is about to make, three more. This will destroy the continuity of the wall and leave the sections standing alone like forlorn icebergs; later on, doubtless, these icebergs will be removed.

Behind this proud fortification Belisarius defended the Imperial City in days when the Roman world is commonly supposed to have been hopelessly degenerate. But was not the chief historian of this period a man of a despondent and cynical temperament? Yet:

One of the most striking things about the wall is the grandeur of its proportions and the excellence of its workmanship. The masonry has nothing feeble or decadent about it, and serves to remind us how slowly the Empire died, and what strength and civilization it showed even in an age which we are too apt to think of as hopelessly effete and impotent.

The reason why the CENTURY PATH protests against such disparagements is because they are a manifestation of that spirit which is ever seeking to depreciate Man, by destroying his belief in his inheritance from the past, depriving him of his just faith in the future, and making him impotent in the present. There are certain classes of mind which take a delight in doing this; and the reason why they take

this delight is an interesting question. In the expression of opinions, the proverb too often holds true that "the wish is father to the thought"; and perhaps these minds find it more comfortable to believe in the impotence of man than in his Divine possibilities. They represent the body of thought whose interest it is to keep things as they are.

The wellsprings of human motive and opinion are indeed hard to fathom; nor are we all conscious of the remote source of many of the incentives to which we give expression. Perhaps in many cases, if we were so, we should hesitate before making ourselves the mouth-piece of such influences. But that there are powerful influences determinedly hostile to the human race, as there are influences that protect and elevate it, is for Theosophists a matter of more than faith. To such influences alone can be ascribed the emergence of great movements that have sapped the foundations of vigor and independence, devastating the countries where they prevailed; the promulgation of crazes that threaten the psychic stability, the intellectual sanity, and the health of the race; and, in general, the propagation of all ideas that make for pessimism, animalism, license, and fanaticism. For this reason, then, Theosophists must ever protest against views which they recognize as the conscious or unconscious manifestation of this destructive energy; and by championship of bygone prowess is one of the ways they protest. STUDENT

## Mexican Antiquities

ANCIENT Mexican art-works in stone and pottery are well represented in collections, though as there are places where the manufacture of "antiques" is a thriving industry, some of those in the collections must be spurious; still they preserve the ancient models and materials. The materials used for the stone articles were principally jade and obsidian. Obsidian breaks with a sharp conchoidal fracture and is thus useful for cutting-instruments, while with quartz sand it can be polished enough to be used for a mirror. The pottery is of red and black

# ✻ The Trend of Twentieth Century Science ✻

## The Earth's Electric Life

**A** FRENCH scientist has been for the past two years making some experiments which tend to throw light on "that earthquake feeling" which they who live in earthquake districts know so well. They sometimes get it when no earthquake happens—there; they sometimes do not get it, or do not notice it, when an earthquake does follow. But the general connexion is well enough established.

It is now known that the earth's surface, as well as the immediately superincumbent strata of air, are permanently charged with negative electricity. The higher layers of the atmosphere, on the other hand, are positive; the charge increasing with the height. Some amount of exchange, of neutralization, is always taking place; and this reaches a maximum during storms. Some force must therefore be continually operative, either within the earth or within the higher layers of the atmosphere, or altogether outside, to maintain the difference. Such a force, at present entirely unknown to us, may be always at work within the earth, a manifestation of earth life.

The potential, as it were the electric pressure, of the earth is constantly changing as a whole; and there are also local changes of which the full study, once made, may reveal some interesting laws. These changes are sometimes slow and slight; sometimes extraordinarily swift and violent. M. Nodon once noted, for example, that at moonrise of a certain evening the negative potential decreased in his neighborhood 150 volts in fifteen minutes. On another day it ran down 200 volts in about the same time. Small oscillations of a few volts seem to be the constant rule everywhere. Very heavy and rapid disturbances, up to 300 or 400 volts in a second, appear to be always connected with earthquakes somewhere. During one earthquake the observer—who did not know that any such phenomenon was happening—found these swift and violent oscillations continued for half an hour, slowly died down to small slow oscillation of a few volts per minute, and then disappeared altogether. One can hardly suppose that alterations of hundreds of volts per second would give our nervous centers no sensation whatever. We now want a complete average longitudinal and latitudinal electric chart of the whole terrestrial surface. STUDENT

## The Growth of Cancer

**A** NOTED Breslau physician, Dr. Braun, in a now widely published lecture, emphatically denies the asserted decrease in the proportional number of cases of cancer. On the basis of statistics covering the last 65 years, he shows that mortality from this cause has advanced from one in 5646 to one in 1207. It appears, moreover, that the disease is extending backward towards youth.

To the contention that the increase in the figures is due to better diagnosis, cases being now labeled cancer which formerly bore other names, he replies that there is at least an equal number of cases which used to be given

that name and are now otherwise classified.

Cancer consists of a number of cells which have gotten altogether out of control of the nervous system, and which multiply without regard to the needs of the rest of the body. Putting the same fact the other way would be to say that cancer expresses a lessened controlling influence in the nervous system, a lessened vitality there. It cannot command its whole domain. In that way cancer reckons in with some other increasing diseases, pneumonia, diabetes, and so on, becoming one of the manifestations of generally lessening vitality. The few (3 or 4) years of increase in the life length upon which the blue-books lay so much stress is due merely to the removal of some destructive factors mostly operative during child life, not to increased vitality.

Cancer is in fact one of the warnings to civilization to consider its ways. Sensuality and unbrotherliness have to be paid for.

## How to Starve

**T**HE secrets of starvation are not yet quite penetrated. The fats and sugars of course disappear first. Then the less important organs begin to yield their substance to the more important, the brain and heart. Finally no more can be spared and then the end begins to be in sight. But long before this a set of disturbances appear which can not be attributed to lack of energy-yielding food nor to the fact that no more organised nitrogen can be spared. These are now ascribed by physiologists to a kind of auto-infection, and they disappear when a small amount of food is given.

He fasts best, therefore, who does not quite fast. The practice is a sort of fad just now, the laity prescribing lengthened periods of it to themselves. These freaks, injurious to the physical, moral, and mental nature, may be made a little less harmful by making the fasting incomplete. And one may add that every benefit that can be expected from prolonged fast can be better attained by various degrees of reduction in quantity and modification of quality. M. D.

## The Old Continents

**B**OTH Atlantis and Lemuria seem to be slowly asserting their right to have existed. So far, however, their claims find readier hearing from the botanists and zoologists than the geologists.

A botanist, Dr. Schönland, speaks to this effect in the Transactions of the South African Philosophical Society. He is studying the peculiar floral types of the south-western region of Cape Colony and speculating how they come to be like those of Australia on one side and South America on the other. Certain plant orders, for example *Proteaceae*, *Compositae*, *Irideae*, *Ericaceae*, and *Rutaceae*, are far more fully represented in southwest Africa and Australia than in any other parts of the world. And there are also strong connexions between the flora of this part of Africa and southernmost South America.

The author concludes that in very early tertiary times there was a land connexion—to wit Lemuria—between southeast Africa and Australia, and that this belt extended still farther eastward (across the Pacific) connecting Australia with South America. Later, still in tertiary times, a belt ran westward—to wit Atlantis—connecting tropical Africa with tropical South America.

Africa is pretty nearly divided by water into two unequal parts. Following the Nile southward we reach Lake Victoria Nyanza. The line is continued by Lakes Tanganyika and Nyassa and finally reaches the coast by the Zambesi river. It looks as though the strip to the east of this line was the west end of Lemuria, at any rate during part of the vast life period of that continent; and that the part west of the line came up later to make the eastern strip of Atlantis. On the other side, part of California also represented at first the extreme east of Lemuria, and then the extreme west of Atlantis. STUDENT

## Sunlight as Antiseptic

**T**HE destruction of dangerous bacilli by sunlight appears to be completer than by any other antiseptic. Tubercle and anthrax bacilli were the recent subject of some experiments in Germany. It was found that the injection of the former, killed by any other antiseptic than sunlight, might be followed by abscesses, intoxication, or even death. So killed, they still contain various toxins which though chemical only and therefore incapable of multiplication in the blood, can still do much damage. A sufficient exposure to sunlight, however, destroys these also. A less exposure leaves the toxins still active. A shorter one again, if insufficient to kill the bacilli, leaves them so disheartened that the blood cells can deal with them—in the process often acquiring the power of dealing with bacilli which have never faced the light at all. STUDENT

## Toxic Preservatives

**D**R. WILEY, of the U. S. Department of Agriculture, has issued a preliminary report of the effects on the body of the antiseptics commonly used in the preservation of food. The report deals with borax, boracic (boric) acid, salicylic acid and its salicylates, sulphurous acid and the sulphites, benzoic acid and the benzoates, formaldehyde, copper sulphate, and potassium nitrate (nitre or saltpeter).

As far down this list as benzoic acid, investigation has now established the fact that these preservatives, when in continued use, hinder and damage cell life and activities, and therefore lower the level of health. Benzoic acid and the preservatives that follow it in the list are still under investigation, but the partial results of experiment still under way indicate that they also are injurious.

So far, the atmosphere of nitrogen appears to hold the field as a preservative. But it is of course only applicable where the air, having been withdrawn, can be excluded. STUDENT

## The English Lake District

THE English Lake District is undoubtedly one of the most picturesque countries in the world; and, in addition to its natural charms, it abounds with literary and poetical associations. It is the home of the "Lake School" of poets, of whom Southey and Wordsworth are perhaps the best known; and it is but natural that the charms of a country of such surpassing beauty should be sung in rich verse. It was on the banks of one of the lakes, Ullswater by name, that Wordsworth saw the "host of golden daffodils," which have been immortalized by him in his well known poem.

Of the lakes and innumerable streams that feed them the poets have written tirelessly; and charming indeed are these little sheets of water. The largest is but fourteen miles in length, and the countless little streams, which locally are called "becks," are delightful in their variety. Rushing down from the steep hillsides these becks are seldom smooth running waters; and tumbling onward to their destination they rush through many a rough channel and oftentimes must leap a rocky ridge if their course is not to be stayed; for the lakes they must reach, and as the result, charming cascades like the one shown are plentiful. Skelwith Force is on one of the multitude of streams that feed Lake Windermere.

The Lake District is also one of the haunts of the geologist; for here the Archaean and older Palaeozoic strata are tumbled together in a confusion that records the combined results of many ancient cataclysmic periods and many aeons of slow upheavals and crumpling.

## Terrible Snowstorms

IN February there were terrible snowstorms in the east of Europe. In Galicia twenty railway lines were blocked, and Lemberg, the capital, was entirely cut off from communication with the rest of the monarchy. Trains were buried in the snow and the passengers suffered from lack of provisions. Communication was impossible, even by sledges, as there were snowdrifts 20 feet deep. Many villages were completely buried, only the chimneys being visible.

## A Weather-Plant Observatory

THE first weather-plant observatory is the subject of an article in the *Scientific American Supplement*. In London is shortly to be opened what is hoped will be only the first of a series of stations for forecasting weather, storms, earthquakes, fire-damp, eruptions, etc., by means of this plant in conjunction with other data.

*Abrus precatorius nobilis* was first so used by an Austrian baron, Professor Nowack. It

## NATURE BIDS THE SOUL ASPIRE

Marlowe

NATURE, that framed us of four elements  
Warring within our breasts for regiment,  
Doth teach us all to have aspiring minds;  
Our souls, whose faculties can comprehend  
The wondrous architecture of the world,  
And measure every wandering planet's course,  
Still climbing after knowledge infinite,  
And always moving as the restless spheres,  
Will us to wear ourselves and never rest.

is susceptible to "electric and magnetic conditions," and the twigs and leaves execute peculiar movements, each of which has its special significance. As soon as a large spot appears on the sun, the twigs of plants in the part of the earth affected execute more or less rapid upward and downward movements; and it is said that the nature and distribution of the disturbances which the spot will produce twenty-six days later, after its first rotation on the sun, can be predicted from the behavior of the plant.

At the Vienna Jubilee in 1888 forecasts were given forty-eight hours in advance, not only for the whole day but for special hours of the day. Nowack was honored by the

Emperor, and King Edward invited him to England where he studied the plant at the Kew botanical gardens. The professor has collected a large number of the plants from one of their native habitats, Cuba, and they have been distributed about. All but one of those sent to England perished, but the seeds brought have sprouted; and 1800 are now growing at the station in Cuban soil which was brought for them.

The plants are in three houses with special stoves: one house for nurslings, another for preparation of the plants, and the third for observation. It is hoped to be able to force them to the prophesying stage at an earlier date than usual in their natural growth. They are more active at night than at day and are *highly susceptible to the presence of people*, so that not more than three persons are allowed in the greenhouses at one time.

They have no flower and consist merely of a long stalk from which branch a number of twigs containing a row of delicate leaves like a maiden-hair fern. These change color, bend, and close up, according to the conditions.

Many remarkable instances are quoted of the power of this plant in predicting weather and cataclysms, and it seems that it only needs recognition and co-operation for a great system of observatories to be established all over the world.

One can not refrain from remarking that here we have one out of innumerable instances where knowledge has progressed by observation of facts and not by the application of theories. Reasoned science, so far from leading the van, has more than it can do finding explanations for the things that are found out. The plant is susceptible to sun-spots, the conditions preceding earthquakes, and the presence of people. Electricity and magnetism will not account for all this unless they enlarge their borders. The truth is that all Nature is bound in a unity by chains which are not perceptible to the ordinary senses; and most of the theories we devise to account for this unity are necessitated only by the fact that we have set out by imagining a separate-ness.

## Mammoth 100,000 Years Old

AN expedition has been dispatched to Siberia to excavate a mammoth which has been found there. As the spot is 200 miles from the nearest village, the expedition will take two months to get there. The mammoth will then be transported on reindeer sledges to the River Lena, whence it will be conveyed to the railway at Irkutsk. It is said to be 100,000 years old; but authorities differ widely about the Glacial Age, and are not particular about the zeros in a date. E.

## SUMMER

J. H. Kummer

NOON---And we stand in the Sun's bright light  
And see what we did not know,  
That the giver of Life is the taker of Life  
And that we have made it so.

With the best we had or carelessly  
We planned and sowed the seed,  
And the growth is good or withers and dies;---  
As it is, so our future need.

Looking ahead we see the road,  
With the forks that lead two ways,  
One to the fruits of duty done  
The other to blackest days.

Push on, with striving much may be done;  
The rank weeds of error that grow  
'Midst our fairest dreams, may be torn away  
Tho' for life the scars will show.

So with Faith to guide our hurried steps  
And Hope to cheer us on,  
The time is short, but some remains:  
Summer is not yet gone.

## The Angel and the Demon

THERE was a musician who composed a piece of music which he called *The Way of the World*. When it was played from beginning to end it was a most uncomfortable setting. It bristled with difficulties, awkward figures and ugly phrases which caused disastrous pauses and very tiresome progressions. He seemed to have selected the most difficult and outrageous means of expression, mixing disproportioned exaggerations with an irregular, unrhythmical accentuation that was disastrous to a successful performance. But in spite of all this it had one very remarkable feature. If you turned it upside down and played it backwards it had a pleasing melody and progression that were cheering.

At first thought this seems too humorous to be a true picture of the way of the world. In the world there are three degrees of progress: get on, get honor, get honest. We embark on the voyage of life with "get on" writ large in our mind and as the musician expressed it we find life bristles with difficulties and awkward predicaments, often disasters, and seldom get into the second degree of getting honor, more often feeling dishonored. The third degree looms too late and the struggle to get on has left us with little time and less nerve or character to more than fancy we are honest. We have chosen the path of greatest difficulty and resistance—the life of selfishness, the one predominant characteristic being to get for ourself alone. We have become hirelings working and living only for what we would get.

Now suppose we took these degrees of progress in the reverse order: get honest, get honor, get on. Here we have the lines of least resistance. The struggle is all within ourselves. We have not to work in the fields

from dewy morn till foggy eve, from the downy cot to the sodden grave to become honest. We can at once endeavor to be honest in our thoughts, honest in our acts, honest in our dealings with ourselves and with others successfully. We *can* have an honest aim and purpose in life and carry it out with an honest method and an honest heart. And is it not axiomatic that "Honesty is the best policy"? Here is a line of life in the world that gets honor and gets on, in a far higher sense than the reverse order. And we live and work not as a hireling, but to accomplish a definite part of our destiny.

The fact is we are tired of and bored with the past and passing methods of life which led to nowhere and ended in nothing accomplished, and in our desperation we have been calling for, praying for a change, a truer, nobler, progressive aim and end in life. Then came Theosophy with its teaching that we were dual beings—Angel and Demon in one: that the cause of our miseries, disasters, and despairing lives was due to the demon of selfishness, due to our living the upside down life of our animal nature. This demon reverses the true methods of life. It lives for and loves only self. It is short-sighted, ill-tempered, greedy, vain, unreliable and dishonest. It has to be treated like a fractious pony, curbed, reined, and restrained, when it becomes obedient, useful and sane.

We, ourselves, are the Angel within the true, the honest, the reliable soul. We are that divine soul all the time, but our brain-mind forgets! As such souls we should endeavor to live for and as part of the whole universe. In opposition to the life of getting we learn to live a life of giving, being compassionate, helpful, forgiving and loving. We, as souls, think out the full meaning of honesty and try to live up to it. We find honesty is a love for truth, right and beauty. We find worrying about the past of ourselves or others is dishonest, foolish, and a stupid hindrance to progress. Honesty demands that we keep our minds on the immediate present, think out what we really are, and hope and act discriminately. To be honest is to keep our eyes and hearts on the good, the beautiful and the just, and act in accordance with our real natures. Our ultimate destiny is to become perfect beings, and the difficulties, the meannesses, the fears, worries and anxieties we have are from the demon of our nature, and are the very means and opportunities for us to assert our divine nature and put them down and not be baulked by them.

This is a task which kills despair and blocks the terrible crimes and calamities which spring from despair. It is a task which does not interfere with one's life or calling, except it be to ease and cheer it. It means to think of oneself as the divine, immortal soul who is inhabiting and using the body we own, and to think and act from our hearts. We can each and all resolve on some unselfish line of life and then make an effort to live up to it. More and more people are becoming familiar with the glorious truths taught by Theosophy about Reincarnation and the law of cause and effect, and we can readily see how every effort to be unselfish is a force which, by the well known law of the conservation of energy, attends us in our next life, if not in this, when circumstances will yield to our effort. And with it

all comes the feeling of gladness felt at once for having tried for even a short time to live the life of the angel within.

This feeling comes from something within us. We know that well. And that something is the soul. This knowledge alone is enough to convince us of the true source of joy, love, and strength, and ought to inspire us to efforts to be one with it.

STUDENT

## Concentration

HOW many realize the difficulty of true concentration, of holding their minds to a thought without permitting it to wander to a thousand and one other subjects.

This is not a mere concern of the mind; it affects the development of character; for the sudden invasion of impulse into the unconcentrated mind may swerve us off the moral track; for our inner nature is good. How many can hold a high feeling, without invasion of other feelings, for more than a fraction of a second? How many can hold impersonally and unselfishly the mental picture of a heroic deed or of altruistic service?—for practically the holding of the picture is one with the intent to carry it into act. In the case of both feeling and picture, the unconcentrated mind is invaded at every moment by other feelings and pictures.

For the same reason how little do we fully realize of that which we *think*! A man may get the *thought* that from a high enough standpoint he would see that his own welfare and happiness and success in life are of no more importance than that of the other fourteen hundred million persons that surround him—let us say not more than that of the forty or fifty who make up his list of friends. But he cannot dwell on this *thought* long enough to *realize* it, long enough and intently enough to make it an active power in his life and consciousness. So he remains selfish, and his consciousness remains unlit by the sunlight of the larger life.

For a moment the mind may feel the touch of the soul on the heart; but how rarely can it hold itself to that moment, how rarely it can prolong that moment! And so the soul remains almost unknown, is quite unknown, or is a matter of mere faith and speculation.

For the same reason how often do we find ourselves in greater or less degree influenced by the thoughts of others. These thoughts of other minds get through a gap in the armor, squeeze past the barrier when our minds have for a moment become negative, lost *all* hold on thought. Such moments may be too brief for ordinary notice, but they suffice for the enemy. And when the enemy is in, we perhaps think him a friend, or even something of our own creation.

So if we would make our attempts at aspiration, meditation, prayer, character-building—to say nothing of common understanding—effective, concentration of attention must be won.

STUDENT

THERE must be in us a power of discernment, the cultivation of which will enable us to know whatever is desired to be known. That there is such a power is affirmed, and the way to acquire it is by cultivating concentration. When concentration is perfected, we are in a position to use the knowledge that is ever within reach but which ordinarily eludes us continually.—W. Q. Judge

## THEOSOPHICAL FORUM

Conducted by J. H. Russell

**INQUIRER.** I have heard of the Rāja Yoga system of education which is carried out by the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY at its Headquarters at Point Loma, California, and at branch schools in different parts of the world; and of the remarkable results obtained by this system, as exhibited in the character and capabilities of the children brought up under it. As I believe that in order to reform the race we must begin with the children, I am naturally desirous of knowing how this can be done. Please tell me first what is the meaning of the words "Rāja Yoga."

**THEOSOPHIST.** The words are Sanskrit and are used because modern languages afford no adequate translation of them. The word *Yoga* means "union," and is employed in the ancient Āryan philosophies of India to denote union with the Supreme, or the methods of bringing about union between the mind and the God within. The word *Rāja* is a qualifying adjective meaning "royal," "supreme." Hence *Rāja Yoga* is the royal road to wisdom, the Perfect Way of life.

**INQ.** But how does this bear upon the education of children?

**THEO.** The basis of right living is recognition of the Divine in oneself and the constant endeavor to realize it in one's own life.

**INQ.** Is not this rather too high an ideal to set before people?

**THEO.** Please do not imagine that Theosophists advocate or practise any sort of monastic seclusion. It is not our fault that the idea of the Divine should have become associated with unpractical notions. We think the world was made to live in and that man is here for the purpose of enjoying it and beautifying it. We do not believe in gloom and our philosophy of life is practical in the truest sense.

**INQ.** But I thought Indian philosophy was always connected with retirement from the world and an attitude of devout resignation and solitary contemplation.

**THEO.** This represents the attitude of some later schools of religious thought in India, where, as in the West, the true and original spirit of religion has suffered various corruptions. But we can refer you to Hindū books which represent the original pure teachings which Theosophists advocate; and these not only do not enjoin false austerity and seclusion, but positively condemn them. They teach, in fact, that true wisdom is to be sought in the duties and privileges of daily life among men.

**INQ.** Could you express shortly what is the cardinal principle of the Rāja Yoga system of education?

**THEO.** It is the attainment of a *perfect balance of all the faculties, physical, mental, and spiritual*. Many of the ancient philosophers taught this principle; as, for instance, Plato; and the Greeks divided education under three heads which represent the same divisions. The neglect of any one of the three results in disproportion and lack of balance.

**INQ.** I can understand the physical and the mental training; but what about the spiritual? I sup-

pose, as you are Theosophists and do not believe in any particular religion, that you must teach the children Theosophy. Is that so, or what kind of "spiritual" teaching do you give them?

**THEO.** Herein lies the secret of the Rāja Yoga method. If we merely taught the children Theosophy out of a book, we could not expect to achieve so much. But at Point Loma, and as far as can be managed in the other Rāja Yoga schools, the whole atmosphere about the children is one of practical Theosophy; so that they catch the meaning and spirit of Theosophy from the conduct and example of their teachers.

**INQ.** Then you do not teach them Theosophy intellectually?

**THEO.** Yes; but not as a set of doctrines or catechism. A great deal of the teaching of Theosophy consists in merely *not* teaching dogmas and theories, thus allowing the natural sense and intuition to assert themselves. It is found that the Theosophical views of life are quite in accord with the views which a child naturally takes when not deliberately discouraged and forced into the conventional grooves of thought. In teaching theological dogmas or scientific theories, one is conscious of the efforts that must be made to bend the child's mind to these molds. But, where the teachings are so natural and logical as are those of Theosophy, no such coercion is needed in imparting them, and the child easily picks them up without any special effort being made.

**INQ.** I should very much like to know more about the actual methods used by you in your schools to produce such admirable results on the young people; as it seems to me that educators in general might usefully apply these methods in other schools.

**THEO.** I fear that it would be of little use for me to describe to you the *methods*, as so much depends upon the teachers themselves. The essential quality in a Rāja Yoga teacher is his *sincerity*. It is because he is so sincere in his convictions that he is able to exercise the influence he does. His evident sincerity and continual care to live up to his convictions afford an ever-present inspiring example to his pupils. Hence it is necessary first for the teacher to be a Theosophist and a worthy and capable one too. If we should attempt to issue to the world any syllabus of instructions as to how to proceed in Rāja Yoga teaching, the result would be that they would misapply them; for, not being Theosophists themselves, they would be attempting to teach what they did not know or did not believe in, and trying to instil principles which they did not practise.

**INQ.** But is the world likely to adopt a system which, as you say, can only be carried out by Theosophists?

**THEO.** The world will be forced to avail itself of it. One has only to study the conditions obtaining in civilized life today in order to see that unless a vital remedy of this kind is applied, the order of society will become impossible. The problem of how to bring up children and educate them so as to make them self-controlled, healthy, and useful citizens becomes daily more difficult. The truth is we do not know what to teach them, as we do not know what to believe ourselves. How can we give them moral control when

we have no practicable philosophy of life to appeal to either by precept or example? I need not refer to the many other social problems becoming more acute with each generation; such as nervous diseases, insanity, the drink question, and so on; nor to the ever-growing friction between the different departments in the industrial world and the different orders of society. But they all turn on the question of self-control and knowledge of self.

Hence Theosophists say that when the world finds itself at a hopeless deadlock in consequence of its lack of knowledge, it will be only too glad to turn to Theosophy as the only power that can show effective results. Necessity knows no law and facts cannot be gainsaid.

STUDENT

## Question

How will working for others result in the cultivation of discrimination? What relation is there between these two things?

## Answer

In the paper which gave rise to the above question it was not said that working for others would result in the cultivation of discrimination, but that by unselfish effort for the good of others with what discrimination we now possess — for we all possess some — such sense could be further developed.

We can gain some further light on this subject if we ask ourselves the question: When we work for others do we have in view the higher or lower nature of those others; do we work in such a way as to appeal to and draw out their higher nature, or is it to pandering to the lower?

We might work for others in the latter sense until our backs grew lame and our eyes grew dim without accomplishing either a sense of discrimination or the good of those for whom we labored. But when in our efforts we unselfishly consider what service will be of actual benefit, and what a means of retarding the development of those we would help, are we not called upon to exercise what sense of discrimination we may possess?

One law of Nature is that organisms develop with use. Then does it not follow that the effort to determine whether our contemplated service will strengthen or weaken our brother, will result in the growth of our power to discriminate?

The mother bird that did not force her young from the nest would be guilty of leaving them the helpless prey of cunning beasts. The bird acts under the law of Nature. Man chooses what service he will render.

The father and mother who under the plea of love spend a life in shielding their children from things they ought, under the responsibility of fatherhood and motherhood, to be helping them to understand and overcome, fail in their duty, give nothing of real value, and gain no increase of discrimination, even although they work their weary bodies into the grave; on the contrary, because they do not exercise the proper thought, their sense of discrimination becomes clouded and dulled from misuse.

It is not by mere working for others that we add to our sense of discrimination, but by our unselfish efforts, whether physical or mental, for their real and permanent good. M. F.

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West.

## What is Theosophy?

"THEOSOPHY itself is that complete story of the world and man, of which a part has been told to every people, a part suited to their needs and development and peculiarities, and told in language appropriate to their understanding."

There is a peculiar significance in the fact that the teachings of Theosophy, which H. P. Blavatsky brought to America over thirty years ago, are becoming widely distributed throughout the thinking world, and that the International Headquarters of the Movement are established in this youngest of nations. All cause and effect are regulated by law, and a knowledge of Theosophy is spreading under the impetus of our modern activity because the time is ripe for it, and the peoples are asking for a larger interpretation of the puzzling problems of life.

So much of modern thought has been along the lines of analysis and in developing specialties that the different departments seem to be separate affairs, not easy to adjust harmoniously together. It is time to relate its specialties to each other, and to study life and its manifestations as a whole. Of phenomena there is no end, but it is time to inquire what it all means. Symmetrical growth is the natural process. Excessive cultivation of the physical, mental, or moral nature alone may result in producing prodigies of muscular, intellectual, or devotional growth, but this cannot give the necessary all-round manhood which alone can rightly relate one to practical life. Attention concentrated upon particular subjects gives valuable information regarding them not to be obtained by a general study; but the specialist soon reaches a point where further progress is only possible by correlating his knowledge with the truth of other specialties.

The test of a man's education is not in the number of facts which he knows; he is cultivated in proportion to his ability to judge their relative values to the whole. Men's ignorance consists not only in failing to know facts, but in not knowing how to use their knowledge.

No one can question the fact that modern consciousness has been enlarged and intensified in every way. Even the children are born an advance upon their parent's generation. We have outgrown most of the old-time standards of measuring life, and yet we are no less confused as to the meaning and purpose of it all. Theosophy presents the timely teaching that man is working out the three-fold evolution of a triple nature. It is this which accounts for the impetus now eagerly active along material, intellectual, and spiritual lines. This is the impelling force which originally created a material stage of earth upon which man has been playing many parts in the age-old drama of human growth. The Theosophical teaching of Karma and Reincarnation shows the entire justice and the scientific reason for men reaping the results of varied experiences which they have sown in a present or a previous life. Viewing man as the immortal pilgrim journeying through the mazes of matter to greater light and wisdom, gives a beauty and majesty and purpose to a daily struggle, which from the partial teachings of theo-

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

logy and science has hardly seemed worth while. Regarding man as a soul, it is easy to see the logic of altruism which extends help to the ignorant individual or to the inferior nation now acting parts which in our turn we may have played with no more dignity or skill. History takes on a new meaning when one considers that the actors in far-off times and places may have been himself. The patronizing pride in our twentieth century progress must be tempered with more modesty in the face of archaeological and historical facts showing that humanity had formerly attained to even greater knowledge in many ways. With all our achievement no modern sculpture or architecture has equalled that of the best period of Greek art. As the Greeks became untrue to their high ideals, their art shows the degeneracy which at last culminated in the national downfall. It was one more example of the cycle of rise and fall in human progress in which the dual nature of man played the leading parts.

In thinking of the ruins scattered over Greece, in viewing the excavated remains of civilizations that are overlaid by dark ages preceding the Pheidian age, in studying the archaeological evidence of the superimposed cities of Troy and of elsewhere, one can but feel the futility of man struggling, insect-like, through his little day on earth if he is to have but one life in which to learn the lesson which so far seems to have eluded him.

The majestic ruins of Egyptian temples are typical of a pure and lofty purpose, and there is increasing evidence that the Theosophical story of the world and man was known in greater fulness in the days of antiquity than now. The rock-cut temples of India point to the importance of the religious life in a forgotten past. If we have but one life here—from which most of us go out but little wiser than we arrive—what use can result from an endless round of struggle to reclaim the waste lands, to build up slowly and painfully civilizations which are destined sooner or later to degenerate into the original desolation? By what right can man claim an inheritance in a spiritual world when he is so unequal to holding a fit residence in the more familiar world of matter? Science has pushed the age of the race farther and farther back; and hence this extension of knowledge calls for a larger conception of the destiny of humanity.

Even the archaeological stones cry out in evidence of the truth of the Theosophical story of the world and man.

The mechanical inventions of today which have multiplied means of rapid transit, facilitating travel and communication, have brought the ends of the earth together and made it easier to realize the unity of human problems. As the Orient and the Occident

acquire a more sympathetic understanding of each other, both are revising their previous opinions of a "heathen." The Hindû student readily finds the doctrines of Karma and Reincarnation in the teachings of the Nazarene. The unprejudiced Christian realizes that the words of Confucius: "Thou shalt not do unto others what thou wouldst not have others do unto you," is quite the same Golden Rule which Jesus taught five hundred years later.

In studying the world's great religions—ancient and modern—even superficial study shows that with all their points of difference, the spirit of the teachings have all fundamentals in common. The differences are more in the externals, in the forms and ceremonies, in the language and methods of teaching than in the fundamental truths which have been voiced by many teachers. We need go no farther afield than the religion of Jesus to see how the many sects of Christianity have variously interpreted the words of one Teacher. If a religion only two thousand years old shows this condition among people with a common environment, it is easy to understand how peoples of different ages and languages and characteristics would naturally lend their own local coloring to any truth.

The disciples of Jesus were given the plain rules for right conduct, and parables which they could comprehend. He gave these spiritual babes the milk that was suited to them, but did not forget the meat for strong men—the "mysteries of the kingdom of heaven." In the *Bhagavad Gîtâ* the teachings of Krishna are more metaphysical in quality, more abstract and comprehensive in relating the nature of man to the worlds of matter, of mind, and of spirit. The *Bhagavad Gîtâ* is calculated not only to appeal more powerfully to certain minds, but it can better satisfy them than could the parables given to the Jews. Yet these differences are only on the surface: the spirit of the teachings is identical. The Hindû who lived up to the best of Jesus' teachings would be as marked among his own for spirituality as the Christian would be distinguished from the average by living the life taught in the *Bhagavad Gîtâ*.

The basis of brotherhood which is a hopeful theory in the international religious congresses, is logically proven to be a fact in nature by Theosophy. This it is which justifies every man's faith to him, making it deeper and broader and more beautiful by proving his religion to be a part of every other religion. Thus the Christian can better reconcile science and theology and can enlarge his conception of a Spiritual Power which has always provided Teachers and Elder Brothers for the struggling masses, in a world which has needed guidance during all of its ages.

Wireless messages and rapid transit are modern symbols of the interchange of ideas and of ideals which is leveling up the world of thought and feeling. Western progress has been emphasized along material lines, while the Orient has always been rich in philosophic thought. The very conditions of the day make the Theosophical story of the world and of man a most timely message, for it comes not to destroy but to fulfil. LYDIA ROSS, M. D.

## Last Sunday Evening at Isis Theater

### A Study of Shakespeare—Hamlet

MR. I. L. HARRIS, at the Isis Theater, San Diego, last Sunday evening, read a paper of unusual originality, first written for and printed in the *International Theosophist*, during the year 1901. The writer of this exceedingly good paper was Mr. Kenneth V. Morris, and Mr. Harris most happily succeeded in bringing out the writer's theme with clearness and feeling.

The paper is reprinted below. OBSERVER

"Whose end, both at the first and now was and is to hold as 'twere a mirror up to nature."

IT has been said that the character of Hamlet has lost half the freshness of its wonder, and that marvelous as it may have been even to have conceived such a man in Elizabethan times, the marvel has grown a commonplace, and "we are all Hamlets now." Indeed, there is too much of truth in this last statement, and for that very reason the play should only take hold of us the more strongly, to shake and awaken us to our more competent selves. For it is the picture on a mirror held up to nature, and depicts a vital stage in the spiritual history of mankind. Hamlet himself is a problem, a mystery to the critics.

They do not know what to call him. They can find no keynote to his personality; was he most genius, madman, hero, coward, sage, fool, diseased ego, or victim of heredity and of the times, they cannot decide. But the truth is that he is not a personality at all, but personality itself, the eternal type of the personality at a certain point in its evolution—that point namely where, in order to become something greater and more divine, it has decreed its own end. Accentuated and blown into flame by the approach of that high liberation symbolized by death, it flashes out on all sides its fascinations and unwhettedness, its petty greatness and titanic incompetence, its brilliance and half-darkness, the humor that does not prevent it piling up for itself most mountainous molehills of sorrow, all the many accomplishments that go hand in hand with an entire inability to accomplish anything whatever. The soul has begun to stir, and its stirring has caused all the confusion manifest in the play.

And here it may be useful to get a little at the inscrutable author behind the invisibility mantle of his writings, and see or conjecture at what part of his life Shakespeare wrote *Hamlet*, and in connexion with what events. We may roughly divide Shakespeare's works and life into four parts and four periods. First an unconscious period, during which he was gaining the ordinary power of writing, or literary faculty. Second, the period of Quest, during which one would say that he was seeking and beginning to feel rather than see the Light—and perhaps *The Merchant of Venice* was one of the highest expressions of this time. Third, the period of struggle between his higher and lower selves, the two lovers of the Sonnets. To this time belong most of the sonnets and the great tragedies. And last, the serene evening, the peace time after conquest, culminating in *The Tempest*, where we are shown man as a great white Magician, a commander of the elements and the elementals, the wearer of a most calm and radiant halo of kingly power.

I think we may take it that Hamlet and Prospero indeed, are the two most significant characters in

Shakespeare; further that they are in truth one, and that one Shakespeare himself. Prospero begins long after Hamlet ends, but he too was once a dreamer like the Dane, and one can hardly doubt that Shakespeare actually painted himself in both cases, first in *Hamlet*, and then, after many years perhaps, in *The Tempest*. For *Hamlet* belongs to the third period, and is perhaps the key-play to the great battle dramas with their thunder and sacrifice and passing gloom.

It stands in point of spiritual chronology at the head of these, preceding *Macbeth*, *King Lear*, and *Othello*; also, in a sense, summing up the contents and lesson of them; so that they may perhaps be called offshoots of *Hamlet*. In all four of them the subject is the great battle between light and darkness from one standpoint or another; they are all tremendous mystery-plays, and the last word of each contains that hope and promise of serenity which is fulfilled in its completeness only in *The Tempest*.

*Hamlet*, then, is the story of one who has taken that vow which is the challenge to mortal warfare thrown to his lower nature and its auxiliary demons; the story of that warfare and of the victory; of how the victory may be bought, at what price, and of its consequences. Its occultism is very conscious, far more so than in *The Merchant of Venice* or any preceding play, and one would almost dare to say that it could only have been written by one who had gone the same way, died as Hamlet, and set up on the throne of his Denmark a hero Fortinbras with scepter and crown.

The play opens in Denmark when the Golden Age is gone, and for some time we are continually reminded of its going. King Hamlet has died, as it is given out, by a snake-bite; in reality his brother Claudius has murdered him, and having usurped the throne is about to marry the queen. With Claudius' accession the age of iron dawns; he is the dark and malignant force, the representant of the powers of selfishness and evil. His brother was that white solar force whose embodiment is in the Helpers of Mankind. So we may say that the Denmark of the play is whatever stage we may choose for the enactment of the soul drama; if we apply it to an individual, it will be his own self and the circle in which his life is cast, if to the race, then it is the world. Queen Gertrude is Nature. She is Hamlet's mother. In his father's time she had always been a good and true wife, winning her son's reverence and her husband's trust, and being under the dominating influence of the latter. But at the end of the Golden Age the White Power is driven away from the outer earth, and the world and nature come under the sway of the dark. Claudius becomes King and marries Gertrude, and Hamlet—poor, shy, incapable, ever delaying Prince Hamlet is left as the bringer about of better things. A shorn and blind Samson among the Philistines—yet there is that stirring within and behind him which will yet drag down their temple about their ears, though he himself be involved in their ruin. A shorn and blind Samson, is this that we call the brain-mind, yet it is the instrument which the soul will use for its own uplifting and the redeeming of humanity, even though again and again it cries out, like Hamlet:

"The time is out of joint;—O cursed spite,  
That ever I was born to set it right!"

For this point is quite worthy of note, that the whole tenor of the play shows that Hamlet has a vaster something to work for than his own kingship, or even than revenge for his father. He has to

set right the times, to abolish the many customs "more honored in the breach than the observance," to cure or cut off the effete rottenness that pervades society, introducing a breeze of purity, wholesome life and manly strength to blow away the sensuality and vice-laden atmosphere. Witness in the last scene, how with the entry of Fortinbras comes this very new atmosphere for which Hamlet has been striving.

We find the Prince full of horror and indignation at the marriage of his mother and his uncle, and here is a picture of the mind awakened from the dull unthinking carelessness of ordinary life to that sorrowful unrest and discontent with the reign of evil that is so often the preface to a search for the Light. In this case it is the next link in the chain to his seeing the Ghost. We find too, in the first scene, that he who was the Golden Age king, has not in truth entirely deserted Denmark—his Ghost walks on a certain terrace in the night. There it is seen by three or four; a phenomenon in a sense, a sign, a wonder; even materialistic but true-hearted Horatio is bound by this very sensible evidence to believe in what he would not. But this Ghost cannot speak or reveal himself except to Hamlet.

So here we have two factors, below, a mind prepared by its rebellion against evil, and above a conspiracy of the gods to win back their own. There are many signs of the peculiar import Shakespeare would breathe into Hamlet's time—much the same as that which we feel and know our own present time has among all the ages. Claudius is disturbed in his pomp and luxury by rumors of the activity in Norway of young Fortinbras, as Herod is said to have been disturbed by the news of Jesus' birth; as we might say, he felt his throne and grip on the world shaken by the far-off rumblings of the awakening of the Soul. He is disturbed, too, by Hamlet's black looks and strange behavior; all these things presage no good for the kingdom of evil and show as clearly as the walking of the ghost that "something rotten" which had to be uncovered and dragged out from the state of Denmark. The man, then, such as he is, and the time are brought together. Hamlet goes to the terrace at midnight and sees the Ghost. He alone of the four is not influenced by fear; he is bold enough now, and draws his sword to make those stand off who would hold him back. And this boldness wins him his commission.

It is curious to note how the Ghost, in truth the Father in Heaven, is here shown as being in hell. But there may be in this a suggestion worth dwelling upon; it is a hint of the tragedy of human history, and as such alone, the Ghost's words will repay study. Also, Hamlet is warned to do nothing against his mother; his mission is to be the overthrow of Claudius. Then, with "Adieu, remember me," the Ghost disappears, the vision has gone, and Hamlet is left to the accomplishment of his Father's will.

From this to the end of the second scene of Act III is chiefly taken up with a most true, delightful and deeply humorous sketch of the brain-mind, when it is fermented, active, sleepy, and thrown agog by the effects of passing a certain point in evolution, that point when determination is arrived at to enter the path towards selfless perfection. Hamlet is contrasted with various persons, they for the most part lightless and he haunted with a vision of light. He is placed beside Polonius and Laertes, Rosencrantz and Guildenstern, beside Claudius and Gertrude and the others, and he is a blind and shorn Samson at Gaza, an object of

pity and scorn to those he will yet destroy. Perhaps there is no character in Shakespeare more attracts our sympathy than Hamlet does, because he is the most general representative in many ways of our own selves. In truth there is hardly so funny a character, not even great Falstaff himself. Could we but see ourselves as we see him, nay not ourselves, but the ineffectual schemers wherein we are so often incased, should we not laugh at these personalities we so highly value? As indeed may be the great Gods who watch us do in spite of their compassion, laugh at our antics.

Mark then Hamlet, and see, if you can, your own lower self in him; for as he sets the players to overthrow and make a picture for his destruction's sake of Claudius, so Shakespeare has conspired to make Hamlet a picture of what we so often are and have been. The Ghost leaves him with a charge and a sacred commission, and straightway Hamlet makes a speech, hits on a phrase, "that one may smile and smile and be a villain," and having hit on it, makes a note of it (we might call it a commonplace perhaps, but remember that we who are looking on at this play are for the nonce the Gods, and how many cherished phrases and emptinesses of the brain-mind order do not sound commonplace to those true Gods who watch and pity us, as we Hamlet?).

Horatio and Marcellus entering, Hamlet is given another chance to begin the work he has to do. Let him tell them what he has heard, that the three of them may go out and rouse the populace and drag down the false king. But no, no, no. Your brain-mind will be in no hurry to do. So when they asked him what message he had had from his father we are again presented with "words, words, words."

"There's ne'er a villain dwelling in all Denmark  
But he's an arrant knave."

All that he made them do was to swear secrecy. If he should assume madness, they were not to seem to know any cause for it; all of which shows he has already foreseen a long course of inaction, of posing, of "play-acting"; all that strange long revelling in sorrow, which could yet walk far hand in hand with his genuine and deep remorse and sorrow for his mother's sin, and horror at the régime of his uncle.

And we must not think that this is a prejudiced portrayal of the brain-mind. On the contrary, it is the personality of rather a fine character; no extraordinary fool, but a man of great talent. The light of the soul is upon him, and though it is too far and dim for greatness, it is bright enough for genius in all but deeds. He can act, fence, fight, and do a thousand other things well. There is, too, a deep vein of earnestness in him which comes of course from the light of the soul, and though he keeps at a respectful distance from the performance of his duty, that distance does not grow really greater; the end in view recedes as he advances, but does not vanish. Indeed at one point it seems to grow very near. After the play he came upon the king kneeling. Assured of his guilt, and having him in his power, he found as usual a pretext for delay, and the chance slipped.

Remarkable is the incident of the play of Gonzago, in its way an effective attack upon the king, effective in that it forced him upon himself and to fight for his very life against Hamlet. But first it lightens his heart with some ray of aspiration, and drove him to that position and place in which Hamlet finding him, might have effected the crowning mercy of his death. But the prince, not having yet learned the true common sense of occultism, failed; and the king rose, having also failed; he could not turn in his path, nor drive backwards and upwards his thoughts, and from that moment there was no hope for him. Whether there would have been if Hamlet had struck then, who knows? Perhaps in some sort there would. For one feels that death then would have meant transmutation, but afterwards there was a certain finality in it.

Then comes Hamlet's memorable interview with the queen, in which the better side of his nature shone forth, and he eagerly strove to set before her a picture of the difference between her first and second husbands, the Higher and the Evil selves. This is a wonderful scene, full of the highest dramatic import. For here, losing sight of unreality for a time, his absolute intentness on the work of redemption won for him once more a vision of the Self Divine. But in the very moment of that vision the instability of the brain-mind is most marvelously manifested. Hamlet is thrown off his balance by it and fails to accomplish the work he has in hand.

Thus in one evening he made two mistakes, first failing to kill Claudius, and then allowing the vision of his father to disturb and ruin his attempt to save his mother. The Karma of these two failures will be remarked upon; in passing we must note an interesting incident. This is the killing of Polonius in mistake for the King. This is worthy of thought and attention, because men are often apt to root up some foolish conventionality, some unimportant mental tongue-wagger, with as great gusto as if it were the Giant Weed itself. If Polonius means anything, he means a very common quality in humanity. Look earnestly, O personality, into thyself, and thou shalt probably see there Polonius, strutting and talking and talking, giving out maxims on end; sometimes appearing to be wise, but always talking. But remember, he is but the tool and fool of his master, and if thy sword is drawn, let it be against the usurping king. The death of Polonius is to be considered an excellent thing, in that it hurried on events and brought nearer their consummation.

But the two great mistakes of that night had put Hamlet a little into the power of Claudius, and the latter was enabled to send his nephew into England, there to be destroyed. This was the Karma of failure. But there was yet a subtle protection for him in this very Karma itself. Still in earnest, still with his pledge to his father burning in him, he found himself shielded at his utmost need, and learned that:

"There's a Divinity that shapes our ends,  
Rough hew them as we will."

So he was landed back in Denmark, and the stream of events flowed on towards its emptying.

Here Shakespeare shows his hero in contrast with two men of action. It may be said in a sense, that looked at as persons, not as principles, Fortinbras and Laertes are the obverse and reverse sides of one coin. In Fortinbras we see the strong efficient man of action as hero, conqueror, and with his first entry a ray of hope and light comes into the play. He is the great soul manifested on this plane. In Laertes also we see a thoroughly practical man; he is likewise a soul thoroughly manifested on this plane, but a very little soul. Selfish, mean, and unprincipled as he is for the most part, his contrast with Hamlet serves to show most strikingly that "the sons of this world are wiser in their generation than the Children of Light." Laertes is certainly a son of this world. As conventional as old Polonius, he is underneath far more capable of evil. Yet when he had a father's death to avenge he did not mope and make speeches or sham mad. He hastened home from Paris, roused the mob, was proclaimed king, and came very near to unseating Claudius and Gertrude. But this little-souled selfish man was more at the mercy of the dark force than ever poor Hamlet was; the same protection of the light did not exist for him, with his shallow nature, and it was not difficult for Claudius to turn and mold Laertes' force and purpose to his own end. So his fencing match with Hamlet is arranged.

And now comes the final scene, the very essence and soul and justification of the whole drama. All through we have seen some higher power pushing Hamlet on towards the accomplishment of his destiny. This higher power that brings him into and

through so much sorrow is not exterior to the larger self of man, it is Karma; and all his sorrows and his death are the rich reward of his high aim. We have seen him with a noble purpose, yet incompetent, as Hamlet, to carry it out. And because of his sincerity in this purpose, we have seen that he knew of and felt a Divinity (the Soul) that shaped his ends in spite of himself, so that crafty, capable, wicked Claudius could do no harm to this irresolute dreamer. Now is to be the accomplishing and sum of his existence.

Those deaths in the last scene are very remarkable. In only one of them, we feel, is any finality. Claudius cannot live on. Death in his case must mean, to be no more as such; it is the destruction of the wicked, the blotting of the evil in a great evil force. Taken as a principle, after such a death only the force remains; taken as a person, after his ending there would remain only something entirely elemental. As for Laertes, he was killed with the sword he had poisoned for Hamlet. But in dying, the evil fell away from him, and he gave up the secret of his own and the king's guilt to their victim, thereby making a certain atonement for his treachery and for the mortal wound he had given to the prince. This death then symbolizes quite another thing from that of Claudius; it is only the handing over of the cord of life. Laertes makes submission and *becomes one with* Hamlet, and, purified, lives on for a few moments in the life of the man who killed him, and whom he too killed.

The queen drank from the poisoned cup which her husband had prepared for her son, and she too, in dying, suddenly attained a clearer vision of things. She perceived at last the vileness of her husband, and calling upon her "dear son Hamlet," left the thread and purpose of her being in his hands. Like Laertes, her higher nature lived on in him until he had done his work. And then, in the hour of his death as Hamlet, he at last killed his great enemy. The dreamer *does*, and dies. King for a moment, he gave his vote for Fortinbras as his successor; and the Norwegian entering, took up the thread where the Dane let it fall. There is no finality, no interruption even, in the death of Hamlet. It is simply that the dreamer has awakened, done one great *deed*, taken his seat on his ancestral throne, and then, lost as dreamer by the very act of awakening, dies and leaves crown and throne to the Mighty Doer, who is, verily himself. For just as we must think of the deaths of Gertrude and Laertes as their becoming lost in and one with Hamlet, so in the death of Hamlet, must we see him but enlarged and set free in the greater being of Fortinbras, and thus the King who enters at the end and assumes unquestioned command in this foreign court, holds in his hands all the threads of the play. When the soul was hidden the various powers of the lower nature were in disharmony; when it came forth they were all united and lost in its greater shining.

Truly then this is no tragedy of sorrow that ends in such a song of victory and joy; but a perfect magnificent poem of life, in which are not shunned nor hidden the passing darknesses and discords of the world, but in whose last verse is their interpretation and solution, a new ray from the unseen sun to make purple and magical all olden woe.

KENNETH MORRIS

THOU shalt not separate thy being from BEING and the rest, but merge the Ocean in the drop, the drop within the Ocean.—*Voice of the Silence*, p. 52.

PUBLIC Theosophical Meetings are conducted every Sunday night in San Diego at 8:15 at the Isis Theater, by students of Lomaland assisted by children of the Rāja Yoga School. Theosophical subjects pertaining to all departments of thought and all conditions of life are presented. Excellent music is rendered by students of the Isis Conservatory of Music of Lomaland, and Theosophical literature may be purchased.

# Art Music Literature and the Drama

## Italian Opera: A Glance at Its Evolution

OPERA was born in Italy. It was the direct outcome of the concerted effort of a *coterie* of cultured Italian noblemen to revive Greek drama and harmonize it with the then modern life of Italy. They failed of this achievement, but as the fruit of their earnest and sincere striving after artistic truth, they created a new musical art-form.

Music was the last of the arts to feel the generous inflowing of the rich current of life from ancient Greece. Both Italian art and letters responded at once to the new influence, when the key to the classic language came into the possession of Italian scholars, who at once translated the masterpieces of Greek literature into the popular tongue. This revival of Greek learning was made possible by the return to Italy of Greek Christians after the fall of Constantinople in 1453. The invention of printing about a decade before facilitated the multiplication and wide distribution of these translations, and their influence was felt in all countries where art and letters were cultivated.

The effect of this upon the music of the day, however, was hardly appreciable—something not to be wondered at when we consider that the first modern school of music was then at the height of its pride and glory. This school of the Netherland masters, so-called, was coincident with the acme of power of the low-lying countries, and the Netherlands were excelling as scholasticists, mathematicians, mechanics, navigators, painters, and in laying down and formulating the laws that govern the science of music. As music was cultivated mostly in the monasteries and convents, it was but natural that its earliest efforts should be devoted to the church service, and that the needs of the liturgy should in large measure govern its development, so that music, like so much of the rich and ample life of the time, became creed- and dogma-bound.

Rigid church modes dominated the work of the musical composers from the Twelfth to the Sixteenth century. Despite the strictness of the laws that governed it, ecclesiastical music reached its perfection towards the end of the Sixteenth century in the beautiful works of Orlando di Lasso (known by this Italian form of his name), who was the chief ornament of the court of Albert, Duke of Bavaria, and the incomparable Palestrina, who, although an Italian, was the very flower of the Netherland School. All the musicians of the day were bound by the strict ecclesiastical forms, and if a Palestrina and an Orlando di Lasso could attain artistic beauty under this restraint it was because of their transcendent genius. Lesser men could not thus build and so composition was miserably fettered.

The germ of a rich secular music was present in all the countries of Europe, where the memories of the old skalds and later troubadours still lingered, in the charming folk-songs and in the pastoral plays. Exquisite madri-

gals were also being written, a development of the old shepherds' songs, and the fashionable sonnet was also set to music and sung; but it was in Italy that this ever-present strain of popular music was first given a definite, amplified, artistic form in what was later termed opera. Under the blue Italian skies, the festival play, the gorgeous pageant and the multiform masque found a natural setting, and brought delight to the hearts of the color-loving and vivacious Italian populace; but the refined sensibilities of the cultured art connoisseurs of the latter half of the Sixteenth century, fed at the fountain-head of Greek art and letters, full of the spirit of freedom

Lomaland Photo. and Engraving Dept.  
VERDI

of the great renaissance, were shocked constantly by the inharmonious music that accompanied their most brilliant fêtes. This dissatisfaction reached a climax when, at a grand festival play in honor of the marriage of a noble ducal pair, the words of the songs were all in joyous praise of the beauty of the bride, while the music to which they were set was strictly canonical, as lifeless as a dirge.

From this incident grew the calling together of the famous Bardi group of noble *dilettanti*. Giovanni Bardi, Count of Vernio, was both poet and composer and, besides, an ardent student of Greek literature. He became the leading spirit of the *coterie* of art-loving noblemen who met at his palace to give to music a truer, freer expression. Such a work could hardly have been done by the professional musicians of the day, bound as their horizon was by the set ecclesiastical forms.

There were present at the Bardi meetings, Count Corsi, a scholar of profound and wide learning, devoted to the study of Greek art and letters; Ottavio Rinuccini, an admirable and gifted poet; Pietro Strozzi, musical composer and poet; Emilio di Cavalieri, the creator of the oratorio, a development from the old Mystery and Miracle plays; Giulio Caccini, a singer of note; and Vincenzo Galilei, father of the illustrious astronomer, himself a brilliant mathematician, musical composer, and skilful lutenist. In their study of the works of Aeschylus, Sophocles and Euripides, they had become impressed with the fact that music was an essential and integral part of the ancient dramas, and that it represented faithfully the spirit of the text. This brought home to them all the more keenly the woful shortcomings of their own dramatic efforts. To the Bardi *coterie*, the most striking feature in the ancient dramas was the dramatic *recitative* to musical accompaniment, so different from the elaborate contrapuntal part-songs of Palestrina and the church musicians. Its most enthusiastic admirer was Galilei, who, to express his conviction, selected a passage from Dante's *Inferno*, which he called *Il Conte Ugolino*, and set it to music for a single voice with lute accompaniment. He performed it himself, to his own accompaniment upon the lute. This dramatic-musical monody was the artistic germ of the future opera. It met with admiration and favor from this critical circle of friends, and this form was taken up and developed among them.

About 1595, when the group was meeting at the palace of Count Corsi and under his presidency, occurred the first extension of the dramatic *recitative* or musical monody into a play. The poem, *Daphne*, was written by Rinuccini, and the music by Jacopo Peri, now a member of the Corsi *coterie*. This very first musical drama was given a private hearing only, but it met with great favor. In December of the year 1600, however, the second work of the composers of *Daphne*—*Tragedia per Musica* as they called it—*Eurydice*, was performed with brilliant *éclat* and much pomp before a grand assemblage of the nobility and royalty, at the fête held in celebration of the marriage of Maria di Medici and Henry IV of France.

The epoch-making work of Jacopo Peri was taken up by Monteverde whose dramas (they were not yet called operas, that term being first used in 1650) were tremendously successful and were works of real merit. He formulated and set forth certain laws governing the outlines of opera, which still obtain, these endowing it with artistic purpose and form. The works of Monteverde were so enthusiastically received that in 1637 a theater was erected in Venice devoted solely to the production of opera. It is a long but logical step from those works to the operas of Giuseppe Verdi whose notable career so recently closed. A LOMALAND STUDENT OF MUSIC

clouds and wind without rain.—*Proverbs, xxv:14*

### Mental Ruts

THESE are unfortunate obstacles to progress from which no ordinary person is free. But recognizing this, we should begin to dig about them, loosen them, level them, not continue to make new ones nor run contentedly in the old ones. It is so much easier to go on acting as we have done, repeating our old mental processes. In some way, though effort is so generally an agreeable thing, it becomes disagreeable the moment it is turned on our own natures—many like to reform others, but it is rare to find the man who likes to reform himself. Everyone has noticed how much more difficult anything is the first time it is done—new routine, a new journey, a new method. This may not involve anything unfamiliar in detail, not the use of any new muscles nor unaccustomed skill, but simply a rearrangement of the hours, a getting out of an old rut and changing a little the way the brain-mind moves from one thing to another. It is quite sufficient to exhaust some people! What a freedom it would be, to be free from this harness, to be able to move without mental resistance from one set of circumstances to another, to welcome what comes and fear nothing!

The Great Ones are not held down in this way. Think of H. P. Blavatsky, who literally plowed her way through life and who probably never had any two days which were alike. These ruts really prevent us from seeing what is to be done, for little by little the walls get so high that they obstruct the view—and we do not like to look over them. We are secretly glad of something which shields us, that is to say, one part of us is glad. Another part frets because life is so monotonous. And so we go, battered back and forth between our fears and our laziness.

It says in the *Bhagavad Gîtâ* that "no man without having previously renounced all intentions can be devoted." This cannot, of course, refer to the great intention—that of

### TO A SWALLOW BUILDING UNDER OUR EAVES

JANE WELSH CARLYLE

THOU too hast travell'd, little fluttering thing—  
Hast seen the world, and now thy weary wing  
Thou too must rest.  
But much, my little bird, couldst thou but tell,  
I'd give to know why here thou lik'st so well  
To build thy nest.

For thou hast passed fair places in thy flight,  
A world lay all beneath thee where to light;  
And, strange thy taste,  
Of all the varied scenes that met thine eye,  
Of all the spots for building 'neath the sky,  
To choose this waste!

Did fortune try thee? was thy little purse  
Perchance run low, and thou, afraid of worse,  
Felt here secure?

Ah, no! thou need'st not gold, thou happy one!  
Thou know'st it not. Of all God's creatures man  
Alone is poor.

By truth, I rather take it thou hast got  
By instinct wise much sense about thy lot,  
And hast small care

Whether an Eden or a desert be  
Thy home, so thou remain'st alive and free  
To skim the air:

God speed thee, pretty bird; may thy small nest  
With little ones all in good time be blest.  
I love thee much;

For well thou managest that life of thine,  
While I! Oh, ask not what I do with mine!  
Would I were such!—*Selected*

serving our fellow men, which we know should underlie every thought, but to all the little personal intentions which throw us into ruts and get us headed in a certain direction which we are determined to follow, all other calls to the contrary. Probably no one of us passes a day without being able to verify the truth of that quotation. Oh, to be flexible in body and mind! What would it not mean to us as instruments of usefulness! The Great Law under which we move seeks to urge us onward, but the donkey trait in our natures

comes to the surface and we refuse to stir; or we lie up against the wall of our rut and let the urge pass by without us. But suppose we were out in the open, sensitive thoroughbreds, responding to and guided easily by the Great Law?

Without doubt the way out of these ruts is the same as that out of many things from which we have got to emerge sooner or later, namely, to cultivate a genuine sympathy for others. This would lead to a genuine desire to help them, and what we genuinely desire, we always find means to accomplish. When our desires lead us out of the ruts, we will assuredly go out. Before that if we leave them, it will be only on short excursions.

Little children come upon the arena of life free from mental molds, and for a short time the earth remains smooth under their feet. This is one of the many ways in which we must become like them, before we can enter the Kingdom of Heaven.

One of the objects of the Râja Yoga school is to preserve in children the flexibility they already possess, and to increase it year by year, instead of allowing them to harden and stiffen until they become almost useless as instruments of progress. STUDENT

### Genius For Motherhood

SOME women—not the majority, to be sure, but unquestionably some—have a genius for motherhood, using the term in its widest signification. One of these was Susanna Wesley, the mother of John Wesley who was her fifteenth child. She was born of Non-conformist parents in London, January 20, 1669, and her mother, too, must have had some genius for her duty, since the little Susanna was carefully reared and, considering the epoch in which she lived, very highly educated. She studied Latin, Greek, and French, logic and metaphysics as well, and from childhood showed an absorbing interest in the religious questions of the day. Her mother allowed

her to think for herself on matters of creed and doctrine—for in her day there was no Theosophy and it was merely a matter of choice between creeds and creeds—and at the age of thirteen Susanna joined the Church of England. In young womanhood she married a curate and then began the history of as noble a battle as ever hero fought, a battle that lasted almost until she was laid to rest in Bunhill Fields, a long persistent siege for the education of her children. There were nineteen of them in all and with the first two or three came the problem of how they should be educated. Mr. Wesley, the father, had no time to spare from his sermons and church work—or thought he had not—nor had he money to pay for their schooling. The burden of the whole problem was calmly laid upon the shoulders of his wife, often in delicate health and never robust, and the way in which she carried it reads like one of the old Bible tales. She started a little school in her house with her own tots as pupils, their number increasing as the years went by, and for six hours a day *throughout twenty years* she continued this work, she the only teacher. Think of the courage, the will, the trust of that woman! Think too, of what she would have found in Theosophy! for in all that is told of her and in her own writings as well, one feels that she felt the limitation of theological thought continually. But hers was the Heart-Doctrine and so her faith was *not* limited.

Many years later, after John Wesley had become famous, he induced his mother to write down some little account of her method in educating her children and this to a degree she did. It is recorded, however, that she said to her son at the time:

No one can, without renouncing the world in the most literal sense, observe my method; and there are few, if any, that would devote above twenty years of the prime of life in hopes to save the souls of their children, which they think may be saved without so much ado; for that was my principal intention, however unskilfully and unsuccessfully managed.

Sarah K. Bolton writes of Susanna Wesley in a recent book, and it is interesting to read between the lines and see how the mother-genius of this woman guided her through all the problems which theology is supposed to solve, but which it does not:

The children were early taught to obey, and to "cry softly." A child was never allowed to have a thing because he cried for it, and John Wesley used to emphasize this in his talks to parents, urging that if a child obtained a thing because he cried, that he would cry again. Mrs. Wesley says, "That most odious noise of the crying of children was rarely heard in the house."

... "Eating between meals was never allowed,"

she says, "unless in case of sickness, which seldom happened. . . . At six, as soon as family prayer was over, they had their supper; at seven the maid washed them, and, beginning at the youngest, she undressed and got them all to bed by eight, at which time she left them in their several rooms awake, for there was no such thing allowed of in our house as sitting by a child till it fell asleep."

The children were taught never to address each other without prefixing "brother" or "sister," a fashion which John Wesley followed through life, as indeed he did thousands of things taught him by his mother. Her will was law with him, her letters through college his oracles, her life his blessed example.

With great firmness she combined great patience. Once, when she repeated the same thing to one child twenty times, her husband said, "I wonder at your patience; you have told that child twenty times that same thing."

"If I had satisfied myself by mentioning it only

how glorious does she seem, building her a little world of aspiration and will for these budding souls to dwell in—her children. What an example is she to the modern woman who so often loses sight of the simple and only true way of life because of the multiplicity of things that beckon towards ease or ambition and away from duty. Motherhood has to do with more than rules and recipes, it must find its divine union with the great Heart of Wisdom or it is not motherhood in any high sense, at all.

STUDENT

### The Tower Prison of Joan of Arc

THE Parisian papers contain reports of an important discovery recently made at Rouen—ruins of the round tower in which Joan of Arc was kept a prisoner. These were found under the earth of an old court-

### A GROUP OF STUDENTS OF THE RAJA YOGA ACADEMY OUT FOR A CONSTITUTIONAL ON THE CAMPUS

nineteen times," she replied, "I should have lost all my labor. It was the twentieth time that crowned it."

Psalms were sung every morning and night at the opening and the closing of school. Each elder child took a younger one morning and evening, and read a chapter in the Bible with him or her, after which each went to private devotions. As soon as they could speak the Lord's Prayer was taught them.

They were to be courteous in all things; a servant was never allowed to grant a favor unless the child said, "Pray give me such a thing." If a child confessed a fault and promised to reform, he was not punished. "This rule," says Mrs. Wesley, "prevented a great deal of lying." Nor was he ever reminded of it afterwards. Acts of obedience were commended. Mrs. Wesley had learned early that the world forgets to commend, but rarely forgets to blame. No one could take the property of another, even to the value of a pin. Every promise must be strictly observed, and a gift once bestowed could not be taken back.

Susanna Wesley stood unique, a woman, a mother, apart. In the light of the present day

yard in which the prison once stood. Antiquarians state that these vestiges are the foundations of the "Tour de la Pucelle" referred to in old French histories.

This "Tour de la Pucelle" has undergone many vicissitudes. As late as 1590 it was still in good condition, being part of a château; but early in the Seventeenth century this château was torn down to make room for new streets in the city of Rouen, the tower, however, being preserved as a historic monument. There is a record that in the Eighteenth century the tower was rented for six pounds per year, and in the annals of Rouen, under the date of 1780, we read that it was demolished. In 1798 it was described as follows: H.

All the lower part of the tower still exists, but the remnants are almost entirely covered with a mass of earth on which vines and trees are growing and athwart which winding paths lead to the summit. A door exists on a level with the earth by which one can enter the prison chamber. This has a sanded floor and the ceiling is still very dry.

# OUR YOUNG FOLK

## Correggio

ONE of the greatest painters of the golden period of the Italian Renaissance, and of all modern times, was Antonio Allegri, known as Correggio from the tiny hamlet of his birth. He was born just two years after the great Genoese explorer landed at San Salvador. Correggio, the son of a baker, had come into a superb heritage. All Italy was aglow with the buoyant strength of the new day. The noble life of olden Greece had been revealed to Italy, at the dawn of the new time, in the discovery of remains of classic art and in the translation of Greek literature into the Italian language. The noble ideals were quickly absorbed into the congenial souls of the Italian people; for the first time in a thousand years, they shook off the veil of darkness that shut out the light, and were joyous and hopeful. Now, as in the ancient days by the sparkling Aegean and among the sun-kissed hills of Greece, a people translated their joy into music, literature and art.

The flower of creative genius was blooming all over Italy, and especially in the favored northern region where Correggio was born. Within fifty miles of his birthplace were Cremona, Mantua, Genoa, Florence, and Venice, while Rome was not more than a hundred and fifty miles to the south. Yet although Leonardo da Vinci, Michael Angelo, Raphael and Titian, stars of the first magnitude, and a galaxy of others hardly less brilliant, were at the zenith of their glory, and admirable schools flourished all over Italy, Antonio Allegri, the happy son of the laughing, flower-embowered hamlet of Correggio, trusted the powers of his own soul and sought none of these outside influences to guide and perfect his native genius. He stayed at home and, painting, found the universe, I dare say, in his own ample soul.

Little is known of the early years of his life. What little instruction he received came from local teachers, with perhaps the encouragement of friendly criticism from visiting artists. When a lad of fifteen, it is said that he went to Mantua to escape the plague in his own village. There he saw the paintings of Andrea Mantegna, an early Italian master, whose imagination had been stirred by the few works of Greek art then known. Correggio was admitted to the cultured circle that assembled in the great castle of Correggio, that towered above the village, where his great gift was known and esteemed. Here the quiet unassuming youth of eighteen heard the works of the great Leonardo praised. These stimulating influences alone seemed to have been enough to usher Correggio into the realm of art.

The outward life of Correggio was almost

CORREGGIO'S MADONNA OF ST. SEBASTIAN — DRESDEN

## THE CHILD IN THE MIDST

Margaret E. Sangster in McClure's

WHEN the Lord of the great and the little,  
The potter whose hand shapes our clay,  
Sets a child in the midst of the market  
Where the world-peoples chaffer all day,  
Sets a child with its innocent questions,  
Its flower-face dimpled and fine,  
In the very heart's core of the clamor,  
A thought of the Maker Divine;—

And men, in their lust for dominion,  
Their madness for silver and gold,  
Crush the beauty and charm from that spirit,  
Make the flower-face withered and old,  
Bind the hands and the feet with a tether  
That childhood can never untie,  
Deem not that Jehovah unheeding  
Looks down from the heights of the sky.

He sees, though we think Him unseeing,  
He knows when the factory wheels  
Grind down to the life-blood of children;  
When the poor little bond-servant kneels  
In the pang of its frightful abasement;—  
Though all men are deaf to its prayer,  
There is coming a dark day of judgment,  
And the Lord of the child will be there.

The child in the midst, as we've marred it,  
Bent-shouldered, dull-eyed, and a slave,  
That cringes at word and at fetter,  
That cries for the rest of the grave;  
With our free flag unfolding above it,  
So free, from the pine to the palm!  
And our scared pallid children beneath it!  
There's a jar in the lilt of our psalm.

From the mine where the midnight engulfs it,  
From the mill where the clogged air is thick  
With the dust of the weaving that chokes it;  
From the home, where it's fevered and sick  
With man's toil, when God meant it for gladness,  
The child in the midst, in our clay  
God-moulded, greed-marred, calls to heaven  
For the vengeance we're daring, this day.

devoid of events, save for the momentous call to Parma, a city about a day's journey afoot from Correggio, whence he was bidden by the abbess of the Convent of Sta. Paola, to decorate the walls of her room.

On these walls and upon the domed ceiling the youthful Correggio, for he was only twenty-two at this time, stands revealed. His ardent, enthusiastic, loving soul poured itself out in color, light, form and motion. Ancient Greece lives again, in his Diana returning from the chase in a car drawn by white stags; the trellised vines of Correggio fling their graceful tendrils and long slender branches over the domed ceiling; and peeping out from amidst the wealth of greenery, laugh the chubby dimpled children of his native hamlet, in the most natural and bewitching poses.

How Correggio loved children! He rarely painted a picture without them; he expressed the joyousness of his own soul in their innocent glee, and they help to give his paintings that character of fleeting motion which they possess. The charming ever-active and omnipresent *putti*, as the Italians call the plump cherubs and cupids; his mastery of light and shade, known as *chiaroscuro*; and the foreshortening of his figures, so that when seen from below they appear in the correct attitudes, are the distinguishing marks of his paintings. An exquisite tenderness and depth of motherly love are expressed in the faces of his Madonnas, as can be seen in the detail from the Madonna of St. Sebastian, on this page. This noble picture is one of the greatest paintings in the world, and is almost as beautiful as the Sistine Madonna of Raphael. The Madonna is represented enthroned on the clouds, and a host of cherubs encircle her head. When you look upon this painting, you feel uplifted as by beautiful music, and you share the joy that raised the soul of the happy Antonio of Correggio on wings.

Correggio never afterwards left the city of Parma. He was so great that he never thought about himself at all. He was simple, quiet, unassuming, happy, talking little, but painting grandly. His real life he lived with his brush, which today still tells the story of the loving, joyous, humane soul that dwelt within his outer being. STUDENT

A SOCIETY for the Prevention of Cruelty to Horses has recently been established in Berlin, Germany. In order that the police officials may act intelligently in carrying out the aims of the Society they are to be given a special course of instruction in matters concerning the treatment of animals. For the guidance of those who cannot attend this course a special list of regulations has been drawn up. M. S.

# THE CHILDREN'S HOUR

## King Thrushbeard

**A**MONG the German fairy tales is one which relates what a very hard experience was needed before a certain princess would learn that royalty does not mean merely royal birth and living in a palace. This is it:

Once there lived a king who had an only daughter, fair and beautiful, but, sad to tell, as selfish and proud as she was beautiful. She cared for no one but herself; her heart was cold. She had many suitors, but scorned them all, saying that they were not good enough for her.

The king wished her to marry, thinking she might be less selfish if she had some one else to think of besides herself; so he gave a great festival, and invited all the young kings and princes from far and near.

The princess, however, treated them all with such scorn and made such scoffing speeches about them that they all felt insulted. One very good and wise king, whose chin was rather pointed, she said made her think of a thrush's bill, and from this he was named King Thrushbeard.

Her father was so displeased at her when he saw how she ridiculed the honorable men who presented themselves, that he declared she should marry the first decent beggar who came to his gate.

Now King Thrushbeard loved the princess, and knew that she had many admirable traits of character, but that they were so buried under her false pride, which she had never been taught to conquer, that her better nature could not show itself. So taking the disguise of a musician, two days later he appeared at the king's gate, and played, in order to earn a trifle. When the king heard him he ordered that he be brought to him. So, in his old clothes, the musician was introduced into the king's presence and played for him and his daughter, and then begged for a small present. The king replied: "Your music has pleased me so well that I will give you my daughter for a wife."

How indignant was the princess when she heard those words! But her father was unmoved by her anger and entreaties, and insisted that she should marry the musician, which she did because she could not help herself.

Her husband then took her to a very small house, which was on the estate of King Thrushbeard; and as there were neither servants nor anyone else to do anything she was obliged to do her own cooking, as her husband ordered her to, or starve. Never having done

Lomaland Photo. and Engraving Dept.

RAJA YOGA TOTS IN A SYMPOSIUM IN THE ROTUNDA OF THE  
RAJA YOGA ACADEMY, POINT LOMA

anything, she did not know how to cook or to attend to the house, but her husband showed her how, and made her do the work in spite of her tears. Then, in a few days, the provisions gave out and her husband cut some willow-rods and said she should weave some baskets to sell. When she tried to plait and twine, it hurt her hands so that she could do nothing but weep. Then he said she must spin, but the thread cut her tender fingers so that they bled.

The musician pretended to be much displeased to think she was so useless, and bought a lot of pots and earthenware and made her sit in the market-place and sell them. "Oh," thought she, "suppose any of my father's servants should come to the market and see me — how they would despise me!"

She was so pretty that everybody bought the earthenware of her until she had soon sold it all. Her husband then bought a fresh supply and secured a very conspicuous place in the market for her to sit in and sell it.

One day a hussar came riding along and rode all over the pots, scattering them about and breaking them in a hundred pieces. In fear and trembling, the princess, weeping bitterly, went home to tell her husband. So relentless and stern he seemed, she did not know what he would do. It was a very humble princess that appeared before the musician.

"Ah!" cried he, "I see you are not fit for any kind of ordinary work, so I have procured you a place as kitchen-maid in the palace of our king" — who was none other than King Thrushbeard!

This was the worst stroke of all. "Oh!" cried she, "if only I had treated King Thrushbeard more kindly, I might now have been his wife, instead of his servant!"

This greatly displeased her husband, who said coldly: "It does not please me at all to hear you wishing you had another man for your husband. Am I not good enough for you?"

She was silent after that; she felt hopeless; her fate seemed to bring nothing but unhappiness; and all this, she realized, was due to her own self, her uncontrolled pride and selfishness. Soon she was installed in the king's kitchen, where she was at the beck and call of the cook, and was forced to do all kinds of hard work, getting nothing in return but her food and some scraps which were given her to take home, and which she carried in her pocket.

Now it happened that the servants in the palace were ordered to prepare a great wedding-feast for a prince. The feast was prepared; the palace full of guests; and the poor princess crept upstairs and tried to look into the ball-room unobserved. The lights were all ablaze, and everything arranged.

Suddenly, forgetting herself, she stood too near the door, and the prince who was to be married, dressed in silk and velvet, with glittering jewels, came in, and seeing such a beautiful girl in the doorway, seized her by the hand and wished to dance with her. She excused herself, in great dismay, for she saw that it was the very King Thrushbeard whom she had treated so rudely.

Her excuses were useless however; the prince drew her into the ballroom, and in struggling to free herself, the scraps in her pocket rolled out on the floor. A great laugh arose, and so overcome with shame was she, that she wished the earth would open up and swallow her. She rushed to the door to escape, but the prince caught her and said kindly: "Fear not; I and the musician who is your husband are one and the same person. For love of you I disguised myself; and I am also the hussar who rode over your pots in the market-place. This has all been done to conquer your pride and make you see how wrong was the scorn with which you received my love. Now, this is to be our real wedding; all is prepared for us."

The princess wept bitterly and said: "I have been very wrong, and am not worthy to be your wife." But the Prince comforted her, saying that the dark days were past and now they would be happy together. So the attendants were called and the princess was presented as their mistress. Soon she was attired in garments befitting her royalty; and all the guests were congratulating her on her marriage with King Thrushbeard. FRED A

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis

Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

### Spirit, Mind, and Matter

OUR present day scientists are still occupied, as indeed they may well be for centuries to come, with attempting to pierce the mysteries which surround the ideas conveyed by the words *mind* and *matter*. Of course this is excellent work, and in course of time must produce results which will enable us to form increasingly true concepts of the world in which we live.

One sometimes wonders, however, whether these investigations would not proceed more advantageously if some preconceived ideas could be eliminated and a return made to more simple and radical conceptions. Or, to put it in other words, would it not be well to take into account the philosophies of the ancient sages, and make the endeavor to go back farther into evolutionary ideas, so as to free the atmosphere from the somewhat tangled chaos of modern theories? The seeker who has failed to find the clue which he is looking for, has many times found that a wider sweep of investigation, outside the first supposed limits, has been rewarded with success.

### Truth Lies Above Argument

It is undoubtedly true that any devoted and persevering searcher for truth finds that his real steps in progress lie outside the usual limits of logical argument, and also outside the limitations of the attempted definitions of others. They appear to come from impressions which he himself receives, and which he is often unable to define or explain. To him however, they are none the less vivid and true. Call it mind, imagination, or what you will, he sees with more or less clearness the germs of basic truths which are all-important in their potential tendency, and which he cannot afford to neglect if he would get upon the right path.

Let us suppose, then, we go back in thought to the inconceivably distant period when the world in which we live came forth from the unknown Absolute. All of the ancient scriptures speak of this in various forms of allegory, and some of them have described in outline a process so reasonable and obvious that no one of educated perception, if he could for once lay aside the mass of modern speculations, can fail to see that these histories bear the stamp of truth written across them. He who would read and see their truth and beauty must, however, stand free in the power of his own best gift of highest perception.

### Wisdom Self-Tested and Evident

In speaking of these ancient philosophies, W. Q. Judge says in *The Occan of Theosophy*:

The divisions of the seven-fold universe may be laid down roughly, as: The Absolute, Spirit, Mind, Matter, Will, Akasha or Aether, and Life. In place of the Absolute we can use the word Space. For Space is that which ever is, and in which all manifestation must take place. . . . As to the Absolute we can do no more than say IT is. None of the great teachers of the School ascribe qualities to the Absolute, although all the qualities exist in IT. Our knowledge begins with differentiation, and all manifested objects, beings, or powers, are only differentiations of the Great Unknown.

The first differentiation—speaking metaphysically as to time—is Spirit, with which appears Matter and Mind.

Within this trinity, then, of Spirit, Matter, and Mind is the whole Cosmos as we know it. The differentiations which succeeded them have been multiple. But these first three stand forth as the basic triad which lies at the foundation of the universe.

It is therefore no great wonder that we can form but vague ideas of what anyone of them really is. Of their qualities and attributes and powers our everyday experience is, however, continually informing us. Objectively and separately, we do not and cannot know them. Subjectively, they are at the very basis of our collective and individual existence. If we think deeply upon the subject we dimly discern that Spirit and Matter are the opposite qualitative poles of every seen and unseen thing, and that Mind is the container of the plan of evolution, and also the evolutive agent, the wielder of destiny, the experienter and the thinker.

The human world as it is today, is therefore the result of the combined thought of the humanity which now exists, and of all humanities which have ever existed; that is, of all who are, or have been, men.

In attentively regarding the abstract ideas which are conveyed by the words Spirit, Mind, Matter, we find that they produce certain impressions more or less well defined. Take Matter for instance. We conceive of it as something more or less hard to the physical or material senses. It has qualities of inertness, divisibility, cohesion, density, gravity, impenetrability, and crystallization. It appears in myriad forms of which it is its own substantive basis.

Of Spirit it is almost impossible to speak, and yet it conveys ideas which are vivid though untranslatable into words. It appears to be everything which Matter is *not*. One of the ancient books of the East, valued by students of Theosophy, speaks of it as follows:

### The Universal Triad of Existence

### The Quality of Materialness

The weapon divideth it not, the fire burneth it not, the water corrupteth it not, the wind drieth it not away; for it is indivisible, inconsumable, incorruptible, and is not to be dried away; it is eternal, universal, permanent, immovable; it is invisible, inconceivable and unalterable. . . .

**The Quality  
of Inner  
Reason**

Some regard the indwelling spirit as a wonder; whilst some speak and others hear of it with astonishment, but no one realizes it, although he may have heard it described.

We can therefore regard Spirit as the essence of all the Life, Law, Order, and Harmony of the Universe, as the one central main-spring or factor, which stands apart, and yet appears in its essential quality behind an infinite multiplicity in created nature.

Of Mind, we may by investigation obtain some very essential and all-important ideas. The ancient philosophers speak of mankind as the "Sons of Mind"; and it is in this capacity that they stand forth as "Lords of Creation," Sons of *Universal Mind*. Mind is evidently a power self-consciously exercised, and as regards man, it is constructive, creative, free, in its essential characteristics. Humanly speaking, it is sensitively delicate to impression, susceptible of cultivation to an extraordinary degree.

Viewing Mind from the human standpoint, it is clear that it stands between two opposite poles, and may reflect the qualities of either,

**The Directive  
Organ in  
The Midst**

so as to modify and alter its character and action. It may be consciously turned towards spiritual impression or material impression. From the circumstances of life in this age and cycle, it naturally receives more easily the impressions of the outer or material multiplicity; but it may be directed in the other direction by him who wills it; and it may be so attuned as to discern the spiritual nature of the universe in the multiform material envelopes which enfold it.

And herein also may be recognized the properties of matter in material thought. Who is there who is not conscious of mental *inertness*? Who of us is able to overcome the sense of *division*, between ourselves and our neighbors? How many of us are able to withstand the *crystallization* of our thought around some passing triviality? Are we always on the alert to withstand the *gravitation* or magnetic attraction towards some divided, separate material pleasure for ourselves alone? These are the material qualities

**Material or  
Spiritual  
Impresses  
on Thought**

of the mind which are deterrent to spiritual progress. On the other hand, there are spiritual qualities to which the mind may be consciously directed. They are so subtle and recondite in their character, that it is no wonder their very existence is doubted so often by those whose minds are persistently turned the other way. They do not force themselves into view like the properties of matter, and yet they are always present. Men may deny their existence with their brain-minds, and yet subconsciously know of their existence and unknowingly work under their guidance. They may be called by various names, such as self-denial, charity, tolerance, patience, and the like. They may even be diverted from their

high purpose by being crystallized and localized into special forms; yet in the lapse of time, and by dint of disillusion, their true nature becomes manifest.

The formative power of nature according to law and order is a demonstration of Immanent Mind. In material life, the hexagonal shape of the bee's cell and of the feathery snow-flake, the octave of colors in the rainbow and of sounds in the musical scale, the perfect shape of the crystal, of the frond of the fern, or of the petal of the flower, *all speak of a geometry which has been conceived in law and harmony.*

And the same great laws are behind all existence in the plane of mind. Materialism in separate, selfish, divided, thought brings about a state of disharmony which we call pain and sorrow. These are great teachers leading us to higher concepts and showing us that the spiritual laws cannot be broken with impunity.

True science is therefore that which is founded upon the first principles of evolution; and whether we look upon it from the lower view, or from the more spiritual view of our higher intuition, it is well sometimes to lay aside the multiple forms of modern speculation and try back to the origin of things, if we would find a clue to the discovery we are seeking.

C. W.

### On Cosmopolitanism

THE essence of patriotism in all times has been the worship of some divinity felt to be incarnate in the race. Of old, Athenian Pallas, or Roman Mars or Vesta; today Columbia or Britannia—they are divinely humanized figures: the only difference is that the ancients knew theirs as real, possessing wisdom, swift to succor, compassionate; while nowadays we dub them conveniently "symbols" and "personifications," to show that we do not know what we mean.

Yet the old inspiration is not lost, and we gain a new and broader vision when the Goddess Mother awakens and her pulses stir through the land, in whatever land it may be. In her hands are the flaming threads, whose ends float now and again into our minds; when we can seize and follow them they lead us to an inward glory, which, think of it as we will, is parcel of her own self. In her mind are all the experiences of countless generations of her sons. Their language is impact with the beauty of whatever vision she may have had of the heavens. She has never expressed herself altogether. Being the Higher Self of a few or of many millions of men, the dignity she has, and the power, are beyond our understanding. The way is opened for her into infinity; her thoughts and memories are shot with the glory of old-time sunsets and dawns. Out of her heart came all the brave deeds and splendid imaginings of demi-god bards and heroes. I doubt you can ever escape from her: leave her, and something of her being is taken with you into other lands; forget her, and still, if you are a true man, she is marching at your side.

This the picture that thrilled the patriot. Now what picture shall move the cosmopolitan to enthusiasm? Is it that of the nations dead, their several glories extinguished? This may look well for commerce, but it will not make a

man's heart beat one jot the faster. Rather shall he see a splendid company of Goddesses, and give love and devotion to them all. Some of them may be young and ungrown; a few old, and seeking re-embodiment in other races; but each has her own splendor, her own glory and beauty, her own mystery to declare. There is not one of them whom the Mighty Mother, the Spirit of Humanity, could do without, not one whom she loves less than another. One, maybe, is shining in silver armor; one plumed and mantled with peacock glamor and magnificence; one raimented with amethystine fires; one robed in topaz stuff. He will not exalt this one above the others, except with regard to temporary or historical importance, nor think of any of them in terms of greater and less, or better and worse; he will exult in the beauty of each. Now one has been in the foreground of events while others slept; now that one has retired into slumber while another or others have come forward. Yet shall he not deem those in the shadow to be less than those in the sunlight; to each has come or shall come her hour and work for the world.

Homage to you all, and praise, you Nations of the world! Glorious and beautiful you are; splendid we know, shall your missions be! The time is coming when the Mighty Mother shall call you all, and give each her own labor; and all shall go hand in hand into the sunlight of the new history. Enmity for any one of you, that have such powers and beauty? No, but love and understanding, and the strong will to waken you into life, to call you down that you may have your active part in the daily living of all your children. With reverence and love we salute you! M.

### Awful Effect of a Telegraphic Error

A STORY is told of how thousands of lives were recently lost in China through a telegraphic error. Owing to the heavy rainfalls in the mountains of northwest Hupeh torrents of water often rush down the sides into the Han, a tributary of the Yangtse. Warning is telegraphed from San-yang, 400 miles away from the mouth of the Han; and on receipt of the warning, men are sent out with gongs to warn the boats at the mouth to find safe anchorage.

On this occasion messengers were sent round with news that a freshet six feet high was on its way down; but little heed was paid to so small a freshet, and it was believed that as in former years, it would not arrive for another twenty-four hours.

But the telegram had been delayed, and moreover the message should have read twenty-six feet instead of six. The flood arrived at midnight in profound darkness, tore thousands of boats from their moorings, sank them, pulverized them, set them on fire. No service could be rendered. The papers state that a small steamer, 700 large junks, and innumerable small craft were destroyed. The loss of life probably exceeded 4000, 1800 bodies having been picked up at one bend of the Yangtse alone.

Was that telegraphist off his guard? This is an instance of what is sometimes called the caprice of fate. But if we could trace out all the links in the chain of events, we should see that no happening is arbitrary. And is such knowledge unattainable as a fact? E.

# Some Views on XXth Century Problems

## How Shall We Deal with Criminals?

A CERTAIN young man who was sentenced to death a year ago, but whose sentence in consequence of an agitation in his favor, was commuted to penal servitude for life, has attempted to commit suicide—for the third or fourth time. As punishment, he is given a period of solitary confinement. A correspondent to a paper asks if it would not have been better to hang him than to condemn him to such stupid and barbarous torture, mental, moral, and physical?

But is the death-penalty not also stupid and barbarous? Does the death-penalty reform a man?

In the light of Theosophy we know that the death-penalty does not even protect society, the notion that it does so being based on the ignorant belief that when you have killed a man you have made an end of him.

Many of our punishments are stupid impatient ways of shirking our duty towards our erring brothers. If a criminal could be gently removed to some institution where he would be deprived of the privileges of society until he reformed; and if that institution were such as to give him the power to reform; then punishment would indeed be humane and remedial.

But how are we to reform him? By religion? and by *which* religion? By science? By agnosticism? How are we to prove to him that a man has power to summon to his aid a supreme Will from the depths of his nature, and by its aid to take his own life in charge and direct his wayward faculties? How can we make the Divine nature of man a living working reality for him?

Clearly we cannot do this so long as we ourselves are tossing on the waves of doubt and do not know whether we have a Divine nature or not. And this is the root of our inability to deal with such cases. One can imagine that a Christ would be able to arouse in this criminal a sense of the strength and purity of the Soul beneath the deluded mind and turbulent passions; but where is the Christ? Not in the pulpit, nor in the academy, nor yet in the market-place.

But that there can be such Christ-men, our ability to form the ideal proves. Ideals do not mock the heart in vain; they are the realities of the future. Theosophy alone has been found able, among the systems of the day, to inspire men with confidence in themselves and give them an anchorage from which they can control the impulses of the lower nature. It alone has positive and rational teachings about the nature and destiny of man and the meaning of life. A civilization based on such knowledge would be able to cope with criminals.

STUDENT

## Mind and Self

AN English physician, recently lecturing before the Institute of Hygiene, threw more light on himself than on his subject. This was "The Special Psychology of Women," and his contention was that there is in reality no such special psychology at all.

But the *psyche* of his psychology turned out to be merely the brain-mind, even merely the brain. From that viewpoint it is easy to show that man and woman are identical, such superficial difference as there is being due to long generations of different habit. One has been accustomed to stay at home, one to go abroad; that is all there is to say.

Some of the elements of mind are more or less developed in women, but there is no special feminine element, no factor present in one sex which is without counterpart in the other. . . . The form of brain-action is identical both in men and women, sane and insane. . . . One sex might carry on the work of the world just as well as the other.

But *psyche* is more than a stream of thoughts about things, more than the producing center of that stream; it is also the atmosphere of feeling in which thoughts arise, an atmosphere absolutely different in the two sexes. The physical basis of maternity is but the outermost expression of true womanhood—which is a keynote of feeling that will continue to sound, whatever imitations of masculinity the woman may affect in her life and education, whatever identities of life and education the pressure of the times may require. The *psyche* is the inner person, between the purely spiritual and the purely animal. It is this which wins conscious immortality by assimilating into itself more and more of the light of the spiritual; yet may lose consciousness of immortality by utter identification of itself, life after life, in thought and action with the body it inhabits. It is in it that inhere the diverse potentialities of masculine and feminine, *both* of which must be brought to perfection in the perfect individual. In successive lives, therefore, it brings one or the other to the fore, the final and outermost expression being physical. Its duties, its mode of education, its path in life, should have close and wisely directed relation to the sex of that particular incarnation. But this direction is obviously impossible if a materialistic identification of mind with brain, and a consequent ignoring of the deeper planes of selfhood, hinder recognition of the profound diversities of sex.

STUDENT

## Divorce and Degeneration

TWO sets of figures come from France, the connexion between which may or may not be visible to everybody. One set shows that the birthrate, for many years declining, has at last fallen *below the death-rate*. The population, slowly ceasing to increase, has at last entered upon a period of positive decrease.

The other set shows that *pari passu* with the falling birthrate is the rising divorce-rate. In 1885 there were about 3000 divorces; in 1890 they had risen to more than 5000; by 1900 they were 7000; the figures for 1906 ran up to 10,600.

The lesser measure of legal separation is in correspondingly increased request. Twenty years ago the annual number of couples availing themselves of it was 5600; it is now

21,000. And according to a new law the separation may after three years become divorce at the request of either of the parties.

The arguments for the facilitation of divorce have all been falsified by the facts. That a husband and wife, knowing that divorce was so easily attainable by the other, would be more careful in conduct; that an unhappy marriage passing through the gates of divorce into two happy ones, would tend to increase the population; that immorality would become less frequent; that there would be fewer illegitimate children:—are contentions which experience has disproved. In the various civilized countries, illegitimate children are about in the ratio of the ease of divorce.

The ease of divorce in any country is the measure of the power there of the spirit of sexual license, and those who argue for the facilitation of divorce are consciously or unconsciously making themselves the mouthpieces of that spirit—the great degenerative force in human life.

France has high ideals—of freedom, of civic virtue, of patriotism, of intellectual possibility. But many of her thinkers seem not to see far enough into human nature to understand that sexual laxity is the rotting of the roots of that *will* without whose health and activity no ideal, of an individual or a nation, has any chance of being realized. What a nation is can never be more than the sum of what its individuals are.

STUDENT

## Prohibition Figures

THE Prohibition Law, now in effect in Georgia, has had time to show its effects.

The traders, small and large, railway men, estate men and charitable institutions give reports all in the same direction.

But one likes concrete figures, and those furnished by the clerk of the Recorder's Court of Atlanta will cover all the ground. This official says:

Prohibition has affected Atlanta a great deal—but for good. The record of this court for January, 1908 (when prohibition was operative), and January, 1907 when saloons were running, speaks for itself:

Number of cases tried in January, 1907	1568
Number of cases tried in January, 1908	637
Number of drunks in January, 1907	553
Number of drunks in January, 1908	65

We are doing about 50 per cent less business this year so far (Feb. 21). This will apply to money collected for fines and the number of cases.

There is nothing surprising or unexpected in any of this. No statistics relating to the effects of alcohol ever collected, failed to point in the same direction. On one side of the case stand the unanimous statistics; on the other the fact that for half an hour or so after a dose of alcohol, its victim feels the pulse of an apparently added vitality. Among those thus taken in is a portion of the medical fraternity. And one of them from time to time giving voice to an opinion which no facts support, affords the necessary scientific backing to a habit which our civilization should have outgrown this long time.

## Old Scandinavian Bronze Work—Ancient Culture of Northern Europe

THE Icelandic sagas alone would prove that a high culture existed in the North some thousands of years ago. The high conceptions of life found in them can by no means be ascribed to a race in which the light has faded; on the contrary, they picture most vividly a people living in the light and spreading this light in their undertakings.

We know furthermore that the people of the North were indisputable masters of the sea for twelve centuries, extending their expeditions into the Mediterranean and the Black Sea, even to Africa and America. There are signs indicating that what we really know about this Viking-time is but the last phase of it—but the shadow of what it originally was, as the light is already rapidly fading when historical records begin their tale of the robust warriors and sea-kings of these days.

The notion of an older and more noble Viking-time is amply confirmed by the abundant treasures of most beautiful and costly antiquities found in the graves dating from this time. This is especially true of the so-called Bronze age, which is said to have commenced in the North about 1750 B. C., lasting to 500 B. C. An interesting fact is revealed by the bronze finds, namely the near relation between the people of the North and the Greeks in the centuries B. C. North of the Black Sea antiquities from early Greek colonies and of Northern origin are found side by side, each distinct in shape and work, though showing equal skill; and in the Scandinavian countries, antiquities of Greek origin are numerous, even of such a fragile material as glass. This fact seems to support some dim traditions of a close intercourse between the great temples of the North and the sacred spots of Greece, Asia Minor, and Egypt.

The graves of the bronze age are generally to be found on the top of some high hill with an unobstructed view of the sea or of some lake. In the early times of this age the bodies were not burned but laid in coffins made of the trunks of oak trees. It is undoubtedly due to the tannin in the oak that even the articles of dress from perhaps more than three thousand years ago are so well preserved that we are able to make out how the people of this time dressed.

Most of the bronze objects are cast, even swords 38 inches long being cast in one piece; and especially the smaller objects are real marvels of casting, such as could not be surpassed even today. There is nothing equal to them to be found in any European country at this time. Gold jewels and gold vases are common, as well as gold ornaments on bronze objects, testifying the wealth of the people.

Among finds peculiar to the Scandinavian countries are large horns or trumpets

of a peculiar shape with pendant chains. They are entirely of bronze, made with surprising skill, and sometimes so well preserved that they can still be blown. They produce

Lomaland Photo. and Engraving Dept.

OLD SCANDINAVIAN BRONZE WORK  
Sword-Hilt, Boss and Bracelets. (Bergen Museum)

a dull and not very loud sound. The ornaments and figures on the objects are often symbolical; we find, for example, the sun-ship, serpents, fishes, the svastika, the three dots, triangles, the triskele, etc. [The triskele is a figure composed of three radii each curved in an arc, and sometimes there are nine dots, three at the outer end of each radius. It is evidently a companion figure to the svastika.] Even the smallest objects, such as pins and buttons, are elaborately ornamented with exquisite taste.

There are no signs of inscriptions from the bronze age. The runic alphabet does not appear before some centuries B. C., and its characters are at first very similar to the characters of the Etruscan and Greek alphabets and were in the beginning written from right to left.

Of the language and means of communication of the bronze age we thus do not know anything as yet. A near future has, however, evidently many surprises in store for us, as each year brings us new finds and will probably throw a clearer light on this remarkable time, when the North was such a high center of culture in Europe.

PER FERNHOLM

Wherever we turn we read in the archaeological records the story of a great culture in the far past that was already decaying at the dawn of history. The same geometrical and numerical symbols are found in the Mediterranean basin, on the Euphrates, on the Nile, on the Ganges, on the shores of the Baltic, on the plains of Mexico and the plateaus of Peru. The same skill in stone and metal work, the same allegorical epics, the same signs of intercourse with distant peoples. Everything bears out the teachings of *The Secret Doctrine*, and confutes the conventional ideas of history.

Dogmatism, skepticism, narrow ideas of all kinds are fast melting away like snow giants in the rays of a rising sun. Our notions of history will be things for our grandchildren to laugh at. Ancient culture and knowledge are revealing their existence more clearly every day. The "gods and heroes" from which races have claimed descent were no myth, but the mighty races of old of whose wisdom and prowess we catch a glimpse in the ruins left by their heirs.

On all grounds, reason requires that we concede to humanity a much greater antiquity than is usually accorded, and cease trying to delineate the whole drama from what are (by comparison) but recent small episodes in that drama. By recognition of our great heritage from the past, we may better fit ourselves for achievement in the future. For, if preceding races have reached such heights, to what heights must ours, a later race, be destined to attain when it has emerged from its childhood and grown strong in unity—that power which made the races of the past so great. H. T. E.

# ✻ The Trend of Twentieth Century Science ✻

## The Two Methods

THE Nilsson experiments on wheat, made in Sweden by a Swede, have taught us the scientific path to the attainment of any variety we want. The ordinary wheat grain is more than it seems. Besides the powers it shows, it contains others more or less latent, coming fitfully into view in its descendants, finding perhaps then no favoring conditions, and passing out of sight again. Growers have hitherto spoken of "developing" a strain to fit such or other conditions. Finding it and giving it a chance to come out, is the more modern view. Roughly speaking, perhaps quite accurately speaking, any desired power to meet any reasonable condition of soil or climate, can be found in any one grain.

In any ordinary grain the hidden characters are known as "dominant" and "recessive." The dominant character is the one tending to come forth and stay, in a majority of the descendants. Recessive characters are those which tend to go out of sight. But if we follow up the other descendants we find that they too have *their* dominant characters, and in *their* descendants, if we keep the line unmixed, we can make them come into relief.

Nilsson's method is to follow up one ear, developed from one seed, and sow its grains separately from the grains of other ears. Various characteristics were manifested in the new ears from these grains. In some of the new grains these characteristics were casual and vanished in the next generation. In others they persisted if the strain were kept unmixed. Such characteristics, which have persisted across a generation, constitute elementary species, and, like the main species, will breed henceforth—unless mixed—true to type.

The simple principle employed by this Swede is therefore to keep to one ear, not to allow cross-fertilization; to select in the progeny the elementary species whose characters you want; and to test and filter that through another generation.

It seems therefore probable that any wheat grain contains all characteristics possible to wheat, latent in reserve, always trying to show up, but always at once diluted by cross-fertilization or hindered by climate or soil to which they are unfitted. But by careful study of the field they can be picked out, filtered clean through a generation or two, and made fully manifest and permanent. We can thus very quickly get any characteristic which it is in the nature of wheat to show. To get characteristics *not* in the normal wheat organization we must experiment, like Burbank, in cross-fertilization with other things.

A Columbia University lecture recently commented on the difference between the Burbank methods and those of science.

It is not that he (Burbank) should not be given the credit of having established new and useful strains of cultivated plants, or of having done some remarkable feats in the way of plant breeding; but it is that his methods are almost purely intuitive and would die with him, . . . a striking difference

from the mass of data accumulated by Nilsson. It is the rule-of-thumb method, picturesque but uncertain, as against the surer but less romantic practices of science.

Suppose the art of musical composition had been lost; no musical geniuses now arose. A science would take its place. Experimenters would say: We want to find some way of expressing a delicate and refined shade of melancholy. They report that the old composers knew how to do so in some intuitive or rule-of-thumb mode. But the exacter scientific methods are now known as the right ones.

So a noted scientist tries all the keys, major and minor, on all instruments, and finally absolutely settles it for all time that the key of A-minor on the cello is necessary. He then tries all the combinations and successions of notes possible to a bar and finally fixes on one of them. By scientific methods, as opposed to those of intuition, it is now determined that this phrase is *the* one for the expression of that mood of melancholy. It is an elementary species.

It would seem that there may be two sciences, one as above; the other a swift intuition of which there are gleams in such men as Burbank. So far as they can use it they get swift and striking results. Other men must plod by the other way—and indeed he also for the most part. For as yet it is in germ. But it is a faculty to be one day fully awake in all men.

## Back to the Nebulae

IT is already being felt that Chamberlin's "planetesimal" hypothesis, offered as an alternative to the nebular theory, still needs the latter to rest upon. According to this latter, space was once filled with a hot nebular haze, either uniform or not uniform. Clouds of this began to revolve round their centers. The center of each became its sun, and various secondary points of condensation in the outlying cloud became the planets, rotating in the same direction as the primary mass.

There were grave difficulties to the hypothesis—among others, that you had to put into the nebula, or suppose to be already there, whatever you proposed to get out of it or explain by it. If the original nebula was still, how came it to rotate? If uniform, how came separate cloud masses, and how the centers that were to become planets in these masses? Grant that it was not uniform, and was rotating—and you can of course explain solar systems. But the difficulty has only been shifted back a step. You have now to explain the rotation and non-uniformity.

Professor Kemp thus summarizes the other hypothesis:

Instead of a highly heated, and subsequently cooled and solidified, gaseous original, minute particles of matter . . . are believed to have moved in orbits around a common center in a manner analogous to the solar system of today. In their evolution they became aggregated into larger bodies such as the planets and the earth, continuing in groups the motions and relations which they pos-

sessed when individuals. As the mass gradually increased, the pressure of the outer layers consolidated the core, and by the mechanical changes involved produced those internal stores of heat with which we are familiar in volcanoes and deep borings and mines. . . . The little particles are called planetesimals or diminutive planets.

The differences of the two theories are obvious. One begins with heat which gradually radiates itself away; the other with cold, heat being generated by friction and contraction as evolution goes on. One begins with nebular gas; the other with solid particles.

But how came the solid particles? And why did they move in orbits? Astronomers are consequently saying that we still need the nebular theory in some form and must regard the planetesimal conditions as but a stage between that and the fully mature systems. So the arguments against the nebular theory reappear with their cause. How is differentiation going to arise in your primary protylic fire mist? Why should subsidiary centers form in it?

But granted that they do, somehow, what about the other end of the drama? Then, we are told, all things will have reached equilibrium and uniformity of temperature. Life, which depends on unstable equilibrium, will have ceased.

But since the theory has been obliged to postulate the inexplicable appearance of diversity, non-homogeneity, at the beginning: why should not the same phenomenon be continually inserting itself all along, absolutely preventing the lifeless uniformity of temperature and the final equilibrium which the prophets perceive to be grimly awaiting us?

The difficulties must stand until a *Nous*, a constructive Will, is admitted into the scheme, that is, until the scheme is rationalized.

## Fruit Life

AN English investigator has been studying the "electric structure" of fruit, using a delicate galvanometer. In different parts of certain fruits he claims to find differences of electric sign. Thus the successive segments of an orange are, he says, alternately positive and negative. The film of connective tissue enclosing the segment is insulative. After the fruit has left the tree for some time this condition no longer obtains; and to cut across the segments with a metal knife of course instantly destroys the insulation. Cooking also destroys all observable traces of electricity.

This sounds probable, and extension of research might reveal the same facts on a much smaller scale. There is probably a difference of sign wherever there are compartments, lamellae, concentric layers, and so on. Even the humble starch granule may contain the same phenomenon. It consists of alternate concentric layers, one series containing a large proportion of crystalloids, staining blue with iodine; and the other consisting mostly of colloids (jellies), readily taking up aniline dyes—thus distinguishable.

## The Suicide of the Norwegian Lemming

**A**N extraordinary phenomenon of animal life is that of the migrations of the Norwegian lemming, a native of the mountains of Scandinavia and akin to the water-rat. This rodent breeds with great rapidity and the surplus population is compelled to seek for new feeding-grounds. Hence from time to time, at intervals of years, it migrates, moving in a vast horde over the country in a march which takes three years. During their progress they eat up every green thing on the way, but are themselves the prey of eagles, hawks, owls, foxes and other carnivora, all of which follow the march with the greatest interest.

But the most extraordinary thing is what takes place when they reach the sea; for here, descending the cliffs, they plunge headlong into the water and swim as if for some promised Eldorado, with the result that all perish. A few survivors on the march are all that remain to form the nucleus of new colonies. It is clear that the question of individuality is but little considered by Nature in the case of these animals. The individuality of Man might look equally insignificant if the human race were viewed from the same distance as we view these animals. After all how little we see of life—merely its outward aspect. But let us not, judging by our own artificial standards, call Nature cruel, which merely drowns animals instead of killing them by old age or disease. Is it not clear that the mere birth and death of physical forms, whether in animal or man, is but a detail in the drama of life? The great inner life, behind all this ceaseless change, and in which we all have part, what is it? Should we not aspire to be it and to know it? May not the human consciousness reach out beyond the confines of personality into a union with the eternal and universal life? Truly men are insignificant, but Man is great. STUDENT

## Gathering Sea-Birds' Eggs

**O**N the coast of Yorkshire in England there is a stretch of coast-line from Filey to Flamborough Head where for nine miles the cliffs rise abruptly from the sea to a height reaching 400 feet. Here professional cliff-climbers risk their lives in the perilous calling of gathering sea-bird's eggs.

The face of the cliffs is studded with sea-birds, chiefly Guillemot and Kittiwake, but also Puffin and Razorbill and jackdaws and carrion-crows. The climbers are let down with a rope, and sell the eggs for eating, or, when they are curiously marked, to collectors.

The egg-gatherer dons a helmet to protect his head from falling stones, and around his body straps a stout web harness. To the harness is attached a rope 400 feet long, and an-

## REBIRTH

From Shelley's *Ode to the West Wind*

**O** WILD West Wind, thou breath of Autumn's being,  
Thou, from whose unseen presence the leaves dead  
Are driven, like ghosts from an enchanter fleeing,  
Yellow, and black, and pale and hectic red,  
Pestilence-stricken multitudes: O thou  
Who chariotest to their dark wintry bed  
The wingèd seeds, where they lie cold and low,  
Each like a corpse within its grave, until  
Thine azure sister of the spring shall blow  
Her clarion o'er the dreaming earth, and fill  
(Driving sweet buds like flocks to feed in air)  
With living hues and odours plain and hill:  
Wild Spirit, which art moving everywhere;  
Destroyer and Preserver; Hear, O hear!  
Be thou, Spirit fierce,  
My spirit! be thou me, impetuous one!  
Drive my dead thoughts over the universe  
Like withered leaves to quicken a new birth;  
And, by the incantation of this verse,  
Scatter as from an unextinguished hearth  
Ashes and sparks, my words among mankind!  
Be through my lips to unawakened earth  
The trumpet of a prophecy! O Wind,  
If Winter comes, can Spring be far behind?

other rope to be used as a guide. As soon as the climber is harnessed, one of his comrades sits on the ground with his feet in holes cut in the earth; he holds the main rope, but is not attached inseparably to it; it is passed through a groove in his stout leather belt and

the free end is held in his hands. The main rope then passes around a pulley attached to a stake at the cliff edge, over which it is paid out to the climber. The guide-rope is attached to another stake.

The climber gradually descends, assisting his fellows with his arms on the guide-rope. There is a code of signals between the men, by which those above can tell what the climber needs and what he is doing. On his boots the climber wears iron claws which enable him to grip the cliff, and from time to time he kicks himself out from its surface to clear a projection, exercising great skill in saving himself from the shock of recoil. During his pendulum-like journeys he gets a view of the nests and grabs the eggs as he swings inwards.

Then the three comrades haul in the rope until the climber appears with his two canvas bags of plunder. These are unloaded and the party moves on to another pitch. T.

## Shifting of the Poles

**A**N article on "Is the Axis of the Earth Shifting?" in the *Scientific American* gives the results of the most careful investigations of this question. The movement referred to is not either of the changes in the direction of the axis relatively to the celestial sphere and known as precession and nutation, but a change

in the position of the axis in the body of the earth itself. That is, the earth does not always spin around the same poles, but the positions of its poles shift in the earth itself.

It had been found that, in determining the latitudes of places, certain errors appeared which could not be accounted for. An observer announced that the latitude of Berlin varied as much as two or three tenths of a second in a few months. Observations were made in the antipodes and found to correspond by opposites with those made at Berlin.

Two periodic influences are at work, one with a period of a year, the other  $12\frac{1}{2}$  to 14 months, their combined effect giving a cycle of about seven years. The pole is shifted 30 or 40 feet from a mean position and follows a rough spiral curve. STUDENT

## Tree-Planting on Railroads

**I**T is stated that the Canadian Pacific Railway intends to plant a row of trees on each side of its line from Winnipeg to Vancouver, a distance of about 1500 miles. These will furnish ties, poles, and wood for various purposes. Besides this use, it is calculated that the trees will form a wind-break and act as a valuable barrier to the snowdrifts which are such a serious problem on the open prairie. Indeed they are expected to save in this way more than the cost of their planting. E.

### 'New Mysticism' Crazes

WHEN the THEOSOPHICAL SOCIETY AND UNIVERSAL BROTHERHOOD was founded by H. P. Blavatsky under the direction of her Teachers, the world was just about to enter into a cycle of its development when attention would be directed anew to the occult forces in Nature and the latent powers in Man. The human organism was growing more sensitive as though in preparation for a new stage in its evolution.

If this new development had been allowed to proceed unguided in the midst of the modern atmosphere of self-seeking, of religious dogmatism, and of scientific materialism, certain and great danger would have resulted for the race. For selfishness being the predominant power, the new forces would have added themselves to the list of powers that were already being misused, and humanity would have plunged headlong into an era of strife and suffering universal enough to have set back its progress for ages.

Foreseeing this, and to save humanity from it, H. P. Blavatsky founded the THEOSOPHICAL SOCIETY AND UNIVERSAL BROTHERHOOD, whose purpose was to *sow the seed of brotherhood in the soil of mysticism*, in order that the development of Man's latent powers might proceed on unselfish lines and be beneficial to the race.

As a consequence of the foundation and subsequent work of the Theosophical Society under its three successive Leaders Helena P. Blavatsky, William Q. Judge, and Katherine Tingley, Brotherhood and purity of life have been firmly established as the fundamental and indispensable conditions of Occultism; and all movements having a contrary tendency, have been forced out into the open and into a declared opposition to these cardinal principles.

The watchword of these movements is *self-aggrandizement*.

To illustrate this, a few quotations are given from an article entitled "The Magic and Mysticism of Today," in a recent number of the *Hibbert Journal*. Quotations from the writer of that article are given below in small type, and the citations which the writer makes from actual "New Thought" publications are in quotation marks within the small type. The cult is described as

That supersensual egoism which is the essence of occultism, disguised by a vocabulary borrowed without acknowledgment from mysticism, metaphysics, psychology, and the New Testament, now being offered to a community too self-indulgent for the discipline of religion, too materialistic for mysticism, too credulous to be satisfied with the wary certitudes of an agnostic philosophy. To mingle Buddhism, Christianity, magic, physical culture, and feeble metaphysics, and make with these ingredients a faith whose chief rewards shall be health and wealth, "heaven here and now indeed," seems a consider-

able task; but the Higher Thought has managed it.

This may be selfishness in a negative form but we get it also in a positive form:

When he is not curing himself of nervousness and indigestion, he is busy checking the inordinate affections which might cause him to feel fear or anxiety for the safety and happiness of other people. "How unkind we think we are if we do not sympathize with our neighbor's sufferings!" says "the New Mysticism." Such an emotion is incompatible with Higher Thought. . . . "Each man is an epitome of the whole creation; and as he rebuilds his consciousness, he re-makes the consciousness of the world. This is comfort for those bewildering first hours when the deep-seated 'heresy of separateness' tempts us to think that this new mysticism is a selfish disregard for the salvation of any soul but one's own." (Quoted from a book on "the New Mysticism")

This should suffice to show even the most skeptical that these cults are not merely selfish but avowedly so; and that they can employ the most jesuitical sophistry in extenuating selfishness. The beginner will experience at first qualms arising from his conscience and natural sense of decent humanity. These qualms—or so we are told—must, however, be fought down. And to help to fight them down a phrase is quoted from the most sacred ancient teachings, a phrase intended to guard against the very sin here committed—the "Heresy of Separateness." What words are strong enough to characterize such tactics as this?

Another mischievous perversion of a sacred teaching is the following. Theosophy says that in order to help the world one must purify one's own nature. This is world-old philosophy, morality, and common sense. But it is here perverted into the doctrine that in order to help the world, one must cultivate one's own personality. Theosophy and all true morality, teach that *self-abnegation is the first step*. We can only develop our own Higher Nature by forgetting our personality and helping the world. Cultivating the *personal* self will not help either ourselves or anyone else.

To live to benefit mankind is the first step. To practise the six glorious virtues is the second.

So says H. P. Blavatsky, quoting from ancient precepts. If even the six glorious virtues come second, where does psychism come? To illustrate again:

"Let your light [that is your solar plexus] so shine that men may see your good works—your love-sunshines—and glorify your I AM GOD which is in heaven."

A religion such as this, which frankly declares that the first and only concern of the believer is with himself, with the prevention of his own ills, the increase of his own income, the recognition of his own Divine Principle waiting within his own solar plexus—which offers prompt practical results, . . . is sure at the present time to be popular.

The vices of this creed seem hardly to need insisting upon. Its outrageous individualism, its concentration upon the ideas of comfort and tranquility, make its rapidly increasing influence a grave evil, whether looked at from the spiritual or from the social point of view. Its interest to the observer of life lies in the cunningness and perfection of its adaptation to a half-educated and over-sensitized community. Our selfishness, our unhealthiness, our conceit, our terror of pain and death, our love of long words and hatred of anything "dogmatic" are here traded upon in turn. From one point of view

the spectacle is an amusing one; from another, and from those who take humanity seriously, it has an element of sadness.

Thus the "New Thought" appears as a concentrated form of that enemy of the age, selfishness, in comparison with which the merely animal selfishness of the ignorant self-seeker is trifling, and even the cultivated selfishness of the sybarite pales into insignificance. Here we have every faculty enlisted in the service of self, and all that is noblest in human thought parodied in the frenzied worship of "I."

No true Theosophist can feel aught but sincere pity for the misguided fanatics who are getting themselves into such terrible straits by their idolatry of man's worst enemy—selfishness. Long and difficult will be the labor of undoing what they are now doing; and, as every man must eventually either conquer or be conquered by his lower nature, they are indeed laying up for themselves a plentiful store of bitterness in times to come.

Fortunate it is indeed that there is still so much inherent health in human nature that these ravings inspire chiefly a well-deserved disgust. But yet it is these notions that serve to frighten away many an honest but timid soul from truths that are sorely needed by all and to drag in the mire of defamation the noble efforts of those who are fighting for the truth. The earnest endeavors of unselfish Theosophists, who have no other aim in life than to promulgate the noble teachings of the Law of Compassion, and to arouse Man to a sense of his real Divine Powers, are continually frustrated by these harpies who prey upon their bounty and infuse poison into the waters of life.

But this is not all the danger. Quotations are given showing that one of the principal and most advertised crazes of the "New Thoughtists" is "cultivation of the solar plexus"! the chief powers of man are said by them to reside in the solar plexus! and rules are given for developing it, such as postures, breathing exercises, fixing of the mind, and so on.

Most people have enough trouble with the desires arising from that part of the body as it is, without wanting to cultivate it. The solar plexus is the chief seat of animal instincts and passions and an important center of animal vitality. Its proper function is to organize and regulate the natural vital functions. It should be let alone, for when the mind comes in contact with it, there arise powerful desires, which menace moral, mental, and physical stability. The commonest way of arousing it is to drink alcohol; and there are other ways, often associated with vice.

In old Eastern teachings, dating from an age long gone by, one may find instructions as to the nature, functions, and modes of controlling the bodily centers. To begin with, they are now but fragmentary, very much that is preliminary being taken for granted by the teachers that wrote them. It must be thoroughly understood that what may have been harmless or even beneficial in an age when people had not the vices and failings of modern civilization, may be most injurious now. In order safely to engage in such studies, it is absolutely essential that the student should enjoy the most perfect health, have perfect

control over all his instincts and passions, be chaste, temperate, and well-balanced, and above all *unselfish*. But in this age humanity is afflicted with selfishness and self-seeking to the degree of a mania, habits are anything but healthy and temperate, and the majority of people are afflicted with weaknesses that prove how little they can control their present vital forces.

Hence Theosophy has always strongly condemned any foolish attempt to meddle with bodily centers; for such practices are fraught with great and certain danger to present humanity. They can but increase the sensitiveness and violence of the passions, without increasing the power to control them, and so must plunge the practiser into difficulties far worse than those which he so vainly expects to overcome by such methods.

The cultivation of the Spiritual Powers of the mind, of Compassion, Purity, Sincerity, Devotion to the cause of human welfare, is the program of the true Occultist. In this way alone can Man develop the powers of his Higher Nature and so control the lower. If any bodily center must be cultivated, let it be the Heart, not the seat of animal life and selfish desire.

It is clear that the selfish forces in humanity are coming to a head under the pressure of a rapid evolution. The moral blindness of these fanatics is amazing. They mistake the sense of personal well-being, the glow of animal life, the feeling of complacency and irresponsibility in the mind, for virtue and holiness. So long as the "I" imagines that it feels happy and good, all is well. The misfortunes of others are treated as afflictions of one's own mind, and the cure is to banish the thought.

There seem to be some people who have never had the faintest conception of a sentiment that is not egotistical or a thought that is not personal. They import the same narrow self-concern into their religion, and care only for the safety of their own "soul" and the spiritual satisfaction of their own inner man. It matters little to them, in the ignorance of their vanity, that the wisdom of mankind through the ages and today has declared that happiness is only to be found in keeping down that tyrant self-assertion of the "I" which it is their most earnest endeavor to accentuate.

Happiness! One can scarcely use the word at all, so tarnished has it become by these personal ideas. One is obliged to say that happiness (in the sense understood by many) is not the goal of humanity at all. There is an old story, variously ascribed according to the nationality, of two generals, one of whom said to his soldiers before the battle, "Glory!" and the other said, "Duty!" One might say the same thing today. One says, "Happiness!" another says "Duty!" If there is happiness for us, it cannot be put first. Duty comes first, and from it follows what is more than happiness — Peace that passeth all understanding.

And see how the fanatics have obscured the Path to Wisdom by their perverted doctrines. The writer quoted from thinks that no form of mysticism or occultism can be of interest today unless it has a practical bearing, and that this is why the "New Mysticism" gets its following. But no allusion is made to an

Occultism which has a practical bearing and yet which is pure and unselfish. Yet this is what Theosophy is, and it is for this reason that Theosophy daily appeals more and more to humanity.

The message of Theosophy to the world is that there is a true Occultism whose watchwords are KNOWLEDGE AND SERVICE, and which proclaims the inherent Divinity of Man, not in a cold academic way, but as a practical fact in daily life. This Occultism is no new craze, but it is that ancient Wisdom which has always been poured forth by the World's Teachers to bless and serve humanity. It is the highest morality and the highest Wisdom. It is known as the HEART DOCTRINE. It recognizes no knowledge but that which comes from the performance of duty. Hear some of its teachings:

When waxing stronger, thy Soul glides forth from her secure retreat: and breaking loose from the protecting shrine, extends her silver thread and rushes onward: when beholding her image on the waves of Space she whispers, "This is I," — declare O Disciple, that thy soul is caught in the webs of delusion.

Give up thy life if thou wouldst live.

If thou wouldst cross the first Hall safely, let not thy mind mistake the fires of lust that burn therein for the Sunlight of life.

Ere thy Soul's mind can understand, the bud of personality must be crushed out, the worm of sense destroyed past resurrection.

Let thy Soul lend its ear to every cry of pain like as the lotus bares its heart to drink the morning sun.

Let not the fierce Sun dry one tear of pain before thyself hast wiped it from the sufferer's eye.

Kill thy desires, Lanoo (disciple), make thy vices impotent, ere the first step is taken on the solemn journey.

Sow kindly acts and thou shalt reap their fruition. Inaction in a deed of mercy becomes an action in a deadly sin. . . . Self-Knowledge is of loving deeds the child.

Step out from sunlight into shade, to make more room for others.

'Tis from the bud of Renunciation of the Self that springeth the sweet fruit of final Liberation.

The selfish devotee lives to no purpose. The man who does not go through his appointed work in life — has lived in vain.

Be humble, if thou wouldst attain to Wisdom.

Be humbler still, when Wisdom thou hast mastered.—*The Voice of the Silence*

H. T. EDGE, B. A. (*Cantab.*)

## THEOSOPHICAL FORUM

Conducted by J. H. Fessell

### Question

How would Theosophy correct the extravagance and wanton waste so prevalent at the present time?

### Answer

By the revival of an old-time virtue which has apparently been forgotten, and whose name seems in danger of becoming an obsolete word — Economy.

Madame Blavatsky told us that "Theosophy is the quintessence of duty." A very important duty, and one of which Mother Nature is constantly reminding us, is to conserve all things, to waste nothing.

Just what does this term, economy, mean? It has been defined as "a sense of the fitness of things," "a knowledge of values," "true economy implies a scrupulousness about that which is not ours," "conservation of force."

When economy is mentioned we usually think of stinting the food, both in quantity and quality; of plainness in dress, perhaps even to shabbiness; of hoarding our money, spending only what is absolutely necessary. With this conception, what wonder that it is looked upon as an undesirable virtue and only to be practised by the miserably poor!

It is one of the objects of the Theosophical movement to restore the true significance of those attributes of man's nature which have been perverted and degraded by his gross materialism. With the higher idea in mind, let us see how economy applies to our physical life.

Every one should know that only when we eat wholesome, well-cooked food in sufficient quantity to satisfy hunger, and for that purpose alone, does our food perform its proper function in building our bodies into healthy instruments for our use.

"A sense of the fitness of things" will not permit us to expend more time, thought or money upon dress than we can conscientiously afford, neither will it allow us to don apparel that by its ugliness or its enormity interferes with the comfort and safety of our neighbors. When we understand that whatever has come under our control, money, power, the natural products and resources of the land, or any of the so-called possessions, none is really ours for self alone, but that we are simply stewards appointed to use them for the benefit of the whole human family; when we realize that our only right in them is the right to share, shall we not, having a true "knowledge of values," use them with economy?

Is it not plain that true economy along right lines tends towards health, morality and spirituality, while extravagance and waste lead to disease, immorality and materialism? How little we know about conserving our vitality, our emotions, our thought force and our spiritual strength is demonstrated by the hosts of nervous wrecks all about us, by the moral downfalls that appal us by their frequency among those who have held the confidence and esteem of their fellows, and by those who without a spiritual compass are unable to get their bearings, and lacking the will to withstand the tide are swept onward by the swift current of doubt and indifference towards materialism.

All these are awful products of existing conditions, and show the necessity that man should understand his nature and destiny, the different manifestations of his power and their source, and how they may be controlled and properly applied to the business of living.

Is it not time that we had educational centers throughout the world where children may be taught these lessons of self-knowledge and self-control, that they may become the real economists of the future and solve the perplexing problems over which we are puzzling under the name of "economics"?

This work has already begun and, through the interpretation of the Wisdom-Religion by the three Great Souls — our Teachers — who have given themselves for the regeneration of Humanity, may we not hope that the extravagance and wastefulness which disgrace our modern day will be unknown to the coming generations who will people this country at the close of the Twentieth Century? H. F. M.

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West.

## The Church Vainly Extols Its Wares

IN an unidentified newspaper clipping a recent sermon is reported to this effect:

"No man has a greater power over his fellows than any other. Christ is the head and all men are brethren. Christ says: 'I am the way, the truth and the life. No man cometh to the Father but by me.' This is clear, distinct and definite; and it is therefore a mistake to approach him through the mediumship of any other. We must take his word as our rule and guide in faith and practice.

"We take issue with those who place the writings of a woman on a par with the Scriptures. Three of the greatest apostasies in the Christian Church were founded by women—spiritualism, theosophy, and christian science. The claim of these people that there is no sin and no satan, and therefore no reason for Christ's atonement, is not Christian.

"When a sect places the writings of a woman on a par with those of Jesus Christ, it is time to speak plain truth."

In the CENTURY PATH, number 28 of this volume, will be found an account of some of the views as to Jesus, Christ, and Christianity, now held by leading theologians and Christian clergymen. The sermon quoted above reflects an attitude of pure dogmatism which is now rapidly crumbling away in the Churches. All the leaders of religious thought are taking the view that religion must agree with reason and common sense, and that it can be but a gainer by so doing.

Let us be quite clear what it is we are speaking of. We are speaking of *present-day* Christianity—that is made clear by the above-quoted sermon. Now upon what are we to base our faith in this system? Upon its intrinsic merits? If so, then we may call upon the system to vindicate them. But instead, we find that the system is everywhere crumbling, is confessedly incompetent to deal with the problems of modern life, and is not leading thought or action, but following in the wake of various secular movements philanthropic, social, etc. If asked to accept this system on its intrinsic merits alone, one must decline.

Then shall we judge it on the strength of historical evidence? What are the facts? Almost all our evidence consists in that selection of gospels, etc. which the various early Church Councils thought fit to bequeath to us out of the whole collection then existing. Of the date, authorship, and authenticity of these writings we are most uncertain; but of one thing we are certain—that they have suffered at the hands of editors both in the original and in the translation. Apart from this, the evidence for the existence and mission of Jesus is so meager as to be rather an argument for his non-existence than otherwise. He is mentioned by no contemporary writer, ecclesiastical or otherwise, and the two or three allusions to him of later historians are considered by competent critics to be interpolations. And when we turn to the accounts in the Gospels what do we find? A prophet, teaching ethics that are as old as the world and could not have seemed in any

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

way new or remarkable to the Jews or Romans, who had heard them all before from a multitude of sources. This man preached over a very small area and died unpopular and deserted even by his immediate followers. After his death a most remarkable and sudden change is alleged to have taken place. The disciples, who had fled for their lives returned and gathered in council; many Jews who had rejected Jesus began to accept him as the Messiah; and around the name of this dead teacher grew up a system that gradually evolved into what we know as Christianity. It was a conglomerate of ancient pagan teachings about the Christos or Logos and the alleged life-story of a Jewish prophet.

The above is briefly the attitude taken by the leaders of modern theological thought on the historical question. Let us apply it to one of the points mentioned in the above sermon—"Christ says: 'I am the way, etc.'" Are we to accept this statement as true and binding for the reason that it was Jesus Christ who said it? If so, then the historical question is raised, much to its disadvantage, as shown. Or shall we accept it on its merits? In this case we shall not forget that other great Saviors have used the same expression in almost identical words, and that their priority in time excludes the idea that they borrowed from Christianity. As an example we may refer to the *Bhagavad Gita*, where Krishna speaks throughout as the Logos, in the first person,

"In whatever form a devotee desires with faith to worship, it is I alone who inspire him with constancy therein; and depending on that faith he seeks the propitiation of that God, obtaining the object of his wishes as is ordained by me alone.

"I am the Goal, the Comforter, the Lord, the Witness, the resting-place, the asylum, and the Friend."

Similarly in the *Avesta* we find utterances like this: "My name is: He who may be questioned; the Gatherer of the People; the Most Pure; He who takes account of the actions of men."

It is needless, however, to multiply quotations in proof of the indisputable fact that it is customary for the teachings of Great Teachers to be cast in this form of using the first person. The Christos or Logos is admittedly a very ancient conception, constituting the basis of all religions. Consequently, the fact that we find the same in Christianity does not entitle that religion to a unique place.

The plain man has no greater reason for accepting the words of Jesus as exclusively authoritative than he has for accepting those of Zoroaster, Krishna, or Gautama the Buddha. If historical evidence is to count, the balance will scarcely be in favor of Jesus.

But no one but a sectarian will follow the *personality* of any teacher, whether Jesus, S'akyamuni, or Zoroaster; but will realize that all of them taught of the "Christos"—that is, the true Self of Man, the Divine in Man.

As to placing the writings of a woman on a par with the Christian Scriptures, we may surely, especially in the absence of historical evidence, estimate writings by their value. Jesus' sayings, if valuable, are so because they are true and not because he said them.

Many other people have said them, before and after Jesus. If the teachings of Christianity are true and serviceable it need have no fear from people who set up pernicious and false teachings; it can surely deal with them. But if some Teacher proclaims a message which is more serviceable to mankind than what the churches are teaching, the people must be excused for forming their own opinion.

It may be remarked in passing that the way in which the preacher has confused Theosophy with christian science and spiritualism, shows that he has not taken the trouble to acquaint himself with Theosophy, which is a drawback in one who undertakes to combat it. It is true that the word "Theosophy" is not copyrighted and that consequently many grotesque doctrines are promulgated in its name; but it is as unfair and as unwise to represent the system one is attacking by its worst misrepresentations as it would be for the CENTURY PATH to represent Christianity by the teachings and practices of the "Holy Rollers." The true teachings of Theosophy may be found in the works of the Founder of the THEOSOPHICAL SOCIETY, H. P. Blavatsky; and the only people equitably entitled to call themselves Theosophists are those who still promulgate those teachings in their entirety, and endeavor to carry them out in their daily life. The present headquarters of the THEOSOPHICAL SOCIETY are at Point Loma, California, from which center Theosophy and its principles are promulgated under the direction of the present Leader and successor to H. P. Blavatsky, Katherine Tingley.

The preacher has a legitimate quarrel with the different cults to which he alludes—that is admitted. But it must be added that the exponents of Christianity have only themselves to blame if they have fulfilled their mission so badly that these crazes have gained ground against them. Christianity is fond of making great claims; let it vindicate these claims.

If the preacher wants the people to come back to the teachings of the Christs of all ages, he must look to a reconstitution of the ecclesiastical machinery; for instead of making these sublime truths living facts in the life of the people, it is acting as a stumbling-block in the way of progress by clinging to old worn-out dogmas. Hence Theosophy has had to take on the duties that the churches have neglected and to withstand the tides alike of inert dogmatism and psychological crazes. Towards such complaints as this preacher makes, one can but feel the same compassion as towards a worried animal that in its fright strikes out blindly at protector and assailant alike.

## Last Sunday Evening at Isis Theater

The Subject: "Druidism."

A PAPER of really exceptional interest was read at the Isis Theater, San Diego, last Sunday evening by Mr. Kenneth Morris, the subject being "Druidism." While the choice of the subject may seem novel to those "in the street," there is absolutely no reason why it should be, for if the fragments of ancient Druidical teaching that have come down to us, and the concordant statements of the ancient classics about Druidism be true—and they are, with due reserve for prejudice and lack of knowledge—that little known system of thought contains mines of the truest wisdom. We repeat, a sympathetic study of Druidism from the available materials will be well worth while, if its only result were the simple freeing of the investigator's mind from the influence of the crass conceit and stupid ignorance that characterize so many of our modern *littérateurs*.

The paper will be reprinted in full separately.

The music rendered was exceedingly pleasing, and executed with both taste and skill.

## Why Old Folks Should Feel Young

THE notion that our assorted scientific knowledge, in this age, is responsible for such success as we may achieve in facing the problems of life, is somewhat of a delusion. It would certainly be truer to say that our accepted ideas frequently stand in the way of the practical wisdom we gain from experience and the light that comes from intuition. How often have the intuitions of our poets failed to carry them over the high palings of theological dogma, and the aspirations of our most enlightened thinkers been weighed down by the ball and chain of consolidated ideas!

When these intuitions find expression, they are either brought to an anticlimax by the attempt to reconcile them with dogmas religious and scientific, or else they take refuge in prudent silence, leaving the reader to adjust his conclusions for himself. For instance:

To become old is not necessarily to grow old. There are young old people. Do not brood over the past. The golden age is in the future. Forget all the unhappy experiences you have had.

Excellent advice! But—Has not the old man, according to current notions, but a few short years to live? Where is his future golden age? If it is a golden age of humanity that is meant, then what concern has the old man with it? He will be perhaps in heaven, where at best he can enjoy this golden age only as a spectator unable to participate; or perhaps—but do not let us brood over the future! Perhaps, again, he may be an agnostic or something of the sort, and expect no glorified futurity whether luminous or fiery; and

again what has he to anticipate from the future?

Ah! Hope: Ah! golden faith, the precursor of Knowledge, that springest eternal in the human breast, how art thou smitten down and beaten back by brain-mind. One could write a new *Pilgrim's Progress* recounting thy fights with the demons and giants of Theory and Doubt, thy imprisonment in the dungeons of Creed and Dogma and 'isms and 'ologies. Wilt thou win through to the Promised Land of thy yearnings?

But Theosophy comes ever to the rescue with its teachings that frown not down nor explain away the golden promises of Hope and Inner Light, but reinforce them, echo them, add to them. Man *knows, feels*, his immortality; but his brain-mind gets to work and quickly undoes his knowledge. He spins himself a web of theory and therein sits, sighing for freedom.

Who invented the theory that Man's life is limited by the duration of his present physical tenement? When was such a belief fastened upon the human mind? It arose during times when man gave himself so deeply to sensual life that his faculties became case-hardened and crusted over with cataract; he lost the knowledge of his Soul-Life and immortality, and believed that his body was all there is of him. Having thus forgotten his immortality, he invented it over again in the form of religious dogmas.

But the ancient Knowledge which Theosophy revives, never doubted the continued existence of the human Soul, nor regarded the body as other than a temporary dwelling-place and instrument, one out of many successive ones. The eternal sequence of birth and death which we see around us, are episodes in the life of the Soul, just as are waking and sleeping.

The old man has indeed the future before him. He can discharge the duties of his maturity as we discharge the duties of an evening after the more vigorous work of the day, in full confidence of a morn of renewed youth, when we can resume what we laid aside.

It will take some time for these wider saner views of life to instil themselves into the thoughts of humanity, especially after such a long reign of despairing dogmas. But the process if slow is sure.

## Buried Potencies

THE discoveries of the age are rapidly vindicating the teachings of H. P. Blavatsky in regard to the knowledge of the ancient sages, and it cannot now be long before the mine of lore discovered in *The Secret Doctrine* is more generally recognized.

In *Harper's Magazine* for May, Professor R. K. Duncan writes as follows:

Outside of all speculation, we are now aware that matter is possessed of transcendent energies—en-

ergies of which, so far, we have been living but on the fringe. Since we know that there is enough radiant energy in one ounce of radium to lift 10,000 tons one mile high, since we know, too, that radium as a chemical substance is in no wise peculiarly different from ordinary matter, since we have shown that even today men have actually devised "trigger" arrangements by which the existence of this intra-elemental energy in ordinary matter has, at any rate, been proved and made manifest, it does not surely unduly strain the imagination to foresee for a future generation that some day some man, somehow, will win forth these super-terrific energies, and will guide them into the work of the world, and that then—there will be a new day.

The dead-letter conception of Matter resulting from the evidence of our physical senses, must be brought to the test of a scientific thought, which is based upon an all-comprehensive philosophy; and if scientists admit (as they now generally do) that matter, as we know it, is but the differentiated manifestation of one primordial substance, it is obviously desirable to endeavor to get some idea as to the cause of these differentiations and their mode of evolution. This is all explained in *The Secret Doctrine*.

In other words it is clear that the wisdom of the ancients must be brought into close contact with modern discovery.

H. P. Blavatsky declares that mineral substance is nothing more nor less than "Light crystallized and immetalized." Compare this with Professor Duncan's statement above. Think of all the coal which is buried in the earth. True, we get from it *some* of its buried heat and light but it is well known that our imperfect methods only make a very small fraction of them effective.

H. P. Blavatsky says that

In all cases when matter *appears* inert, it is the most active. A wooden or a stone block is motionless and impenetrable to all intents and purposes. Nevertheless and *de facto*, its particles are in ceaseless and eternal vibration which is so rapid, that to the physical eye the body seems absolutely devoid of motion; and the spatial distances between those particles in their vibratory motion is—considered from another plane of being and perception—as great as that which separates snow-flakes or drops of rain.

Inertia, so-called, is force according to Newton, and for the student of the Esoteric Sciences, the greatest of the occult forces.

At first sight this may appear inexplicable, but let us consider the curious phenomenon of the gyroscope. No one has yet been able to explain why rapid revolution has so strong a tendency to *resist* any alteration in the direction of the axis. The faster it revolves the greater this resistance. If we accept the teaching of *The Secret Doctrine* as to the rapid gyration of the molecules, we may have less difficulty in seeing how the segregation of a mass of such molecules produces the external phenomena which we know as hardness and inertia, attraction and repulsion. STUDENT

### Unrest Among the Churches

EVIDENCE is continually accumulating that the present is an age when systems of religious thought and practice which have existed for centuries have reached the end of their public usefulness. One can scarcely take up any magazine or daily newspaper, without seeing this fact written large across its pages. The world is seeking something which it has not yet found, and—as in the past, so now—dissatisfaction and disillusionment with existing conditions, must precede any practical measures leading to the next higher step. Iconoclasm of some kind must pave the way to progress. It need not necessarily be violent, but it must be a breaking up of old ideals, so that the phoenix may arise from the ashes of the past. These are the “world’s eternal ways.”

As an instance of this, witness a paragraph taken from one of England’s most important newspapers, *The Liverpool Daily Post and Mercury*.

It is from an editorial review of a book called *Anglican Liberalism*, and written by twelve well known members of the English Episcopal Church. The review is written in such plain language that there can be no possible mistake as to the meaning. The writer says:

In the opinion of the writers, the Church of England today stands upon the brink of an abyss. She has lost her hold upon the people; she is altogether out of touch with educated thought; as a factor in the national life she is disregarded; her doctrines are antiquated and outworn; and her theology is not wholesome food for the Englishman of our generation. Unless reformed she will be engulfed. Unless adapted to the age she will not survive. The language of theological dogma is like Latin, a dead language, and requires retranslation. In what measure reform is needed, to what extent and in what direction the doctrines of the Church are capable of adaptation, into what modern tongue the dead language of theological dogma may be translated, the book designs to show. . . . The reputation, the scholarship, the sincerity of purpose, and the deep spirituality of the writers are alike cordially admitted, and to whatever extent the views set forth may be repellent, if not even shocking, to Churchmen of the orthodox school, the bona-fides of the authors of the twelve essays, of which the book before us is composed, is not likely to be brought into question. Not since the publication of *Lux Mundi*—it appears to us—has a volume appeared, more likely to become the subject of fierce, and, we may hope, fruitful controversy, than the book published this morning. . . . “Liberal Christianity,” if it be in any sense true, must live, and its life must depend, and will depend, upon its truth, and nothing else. If it does not survive it will be because it is not true, and because it conveys no message to the human soul from its Creator.

Such utterances as these, taken with other signs of the times, which are springing up in every direction, serve to amply confirm the statements of H. P. Blavatsky, that the beginning of the twentieth century would witness a great upheaval of existing conditions, caused by a renewed spiritual force. The truths which underlie the teachings of Christ, are just as powerful for man’s enlightenment as they ever were. They have been misinterpreted and diverted from their meaning, crystallized into narrow and mistaken systems, the numberless ramifications of which are the puzzle of the age. From the stand-

point of the basic truth called Theosophy, the history of all this is explained, and students of that teaching await with confidence, that evolution of contemporary history which is founded upon a return to first principles. W.

### Episcopal Congress Pronounces Against Bible

THE Congress of Episcopal clergymen in Philadelphia pronounces against the Bible as “holy writ”; and three or four members declared that the two testaments are full of inaccuracies, while many admitted that the Old Testament was full of fiction, and very poor fiction at that. One delegate stated his opinion that Moses had “borrowed” his laws from nations a thousand or more years older than his own.

Years ago scientific men dared to utter these views. Later isolated ministers made bold to utter them and were banned. Now they are officially declared in a Congress of ministers. The times move rapidly. T.

### A Timely Warning

THE following article written specially for members of the Masonic Order depicts the general conditions of the Western world so graphically that it can be read with profit by all members of society both as a warning and an appeal. A warning because a society honeycombed with dishonesty is bound to speedy destruction, and an appeal to the heart of every man to re-ignite the smoldering embers of brotherhood.

The great danger arising from the selfishness prevailing in our civilization has been forcibly pointed out for many years by the Leaders of the Theosophical Movement, H. P. Blavatsky, W. Q. Judge and Katherine Tingley; and the need of a higher standard of ethics is not limited to the legal profession but that standard is equally lacking and equally desirable in every transaction from man to man, in thoughts, words and deeds, extending even to the creatures whose complaints we cannot hear. STUDENT

### DISHONESTY

THE idea prevalent at the present time that it is not dishonest to cheat, wrong or defraud your fellowman, so long as you manage to keep out of the clutches of the law, has caused and is causing much anxiety to honest, truthful men who ask themselves, where will it lead to? That much unrest among the masses and a disregard of human rights has been the result of the dishonest practices of men who knew that they were violating law when they consummated the questionable transactions in which they were interested, is not to be denied.

Dishonest practices have become so general that Judge David J. Brewer of the United States Supreme Court, in a speech on the subject spoke as follows regarding the dishonesty of the law:

“In the present day of intense commercialism the lawyer cannot escape its temptations. Indeed, in some aspects, he is more exposed than others. The rapid accumulation of money is a mania. Money mad was the criticism placed upon a man who personally, socially, and in the ordinary affairs of life, was kind, considerate in his treatment of those in his employ, generous and, according to purely legal standards, honest; but in the domain of business, he had acted apparently upon the theory that whatever is not positively prohibited by statute is morally right; and so in many ways, some of which were certainly open to criticism, he had accumulated

a large property. That man will seek the brainiest counsel, one who can advise correctly as to the precise limits of the law; but his only thought is of the brains and knowledge, and the lawyer who best answers that thought will get employment and compensation corresponding to the pecuniary returns which follow the advice.

“Counsel responding to such a client may in one sense of the term be honest; but it is a negative honesty. It is an honesty which regards simply the client, the statute, and the pay. It is an honesty which ignores the fact that both client and counsel are members of society, and assumes that there is no moral obligation upon either to respect the general welfare.

“Is it strange that there should be so much criticism of the bar? We must remember that the wisdom of the law-maker can never keep pace with the ingenuity of trained minds seeking to evade legal limitations. The old saying that holes may be found in every law means simply that an ingenious lawyer can often find either in the statute itself or in the mode prescribed for its enforcement some way of escape from its penalties. It is this which provokes the frequent remark that the law so seldom reaches the rich, for the rich can pay for the brainiest, who quickly discover the means of evasion.

“As against this, I appeal for a higher standard of professional ethics. I appeal to every lawyer to put his heart alongside his head, to mix his conscience with his brains. Let him have the courage to say to his client, ‘It may be legal; but it is dishonest, and I will have nothing to do with it.’ Is this asking too much of the profession?”

This speech should be carefully read by every Mason and applied to his every-day doings with his fellowman.—*Masonic Tidings*, April, 1908

### Cubic Contents of Heaven

IT is no argument against religion to show up the absurdity of taking figurative passages in the Bible literally; but it may serve as a warning against literal interpretations in general.

In the correspondence columns of a newspaper an inquirer asks:

Can it be shown mathematically that there will be room enough in heaven for all the people of past and future centuries?

The answer is given by reference to the text in *Revelations*:

And he measured the city with the reed, 12,000 furlongs. The length and the breadth and the height of it are equal.

From this it is calculated that heaven is a space of 469,783,088,000,000,000 cubic feet, allowing room for everybody, even at the most liberal computation, to have a little cosmos to himself. The present writer remembers a book written by an English clergyman of a past generation in which this and other similar subjects were treated with all seriousness and solemnity. It was called *Physico-Prophetical Essays*, was extremely learned and mathematical, and had diagrams of the “New Jerusalem” drawn to scale, represented as a gigantic cube protruding from the periphery of the earth. The author proved that it would alter the center of gravity of the earth and hence its axis of rotation.

But if we are to take the *Apocalypse* of St. John literally throughout, we shall have to face greater difficulties than this. The question is, Why should we take the “Lake of Fire” and the city of golden streets literally? The symbolism of the *Apocalypse* is treated of in *The Secret Doctrine*. STUDENT

# Art Music Literature and the Drama

## Music-Drama and the Actor of the Future

**A**MONG the higher attributes of man are the appreciation and love of aesthetics and poesy. Through these the mind conceives the limitless beauties of Nature, and they are potentialities in every human being. Music is in one sense the chief agent by which they may come to fruition, but to attain to the fullest expression of these noble qualities requires a setting of all the arts combined. The prodigious wonders of the soul and its marvelous beauty demand the opening of every available avenue of perception in order to realize its inherent nobility and perfection.

musical declamation, philosophy, and illustrative orchestration. The chief support and basis is music as being the most versatile descriptive element. Foremost in musical tone is the human voice, and singing declamation can be brought to such a point of perfection as to give the fullest scope to the great wealth of emotion which lies pent up in every human heart. When combined with thoughtful and suggestive orchestration and the other accessory arts it should express much that is inexpressible by the spoken word, and surpass all the other vehicles of culture.

It is not generally recognized that singing

auditor into a perfect fairyland of nature pictures. Siegfried lies on a moss-covered rock, perfectly oblivious in his youthful exuberance of the close proximity of the voracious monster dragon he has come to slay. The orchestral interpretive picture of the bright summer morning is so perfect, so happy, the mood of Nature so consonant with the youth's feelings, that it suggests almost an identity between Nature's majestic peace and the unruffled composure of the fearless boy. Overshadowing this peaceful picture is the momentous danger that lurks near in hideous enmity. The actor's prolonged silence is not even noticed. His

### A GLIMPSE OF THE GREEK THEATER IN LOMALAND

Erected early in 1901 by Katherine Tingley, and the first of its kind to be planted upon American soil. Here the *Eumenides* of Aeschylus, *Hypatia*, and other Mystery-Music-Dramas have been presented by Lomaland-Students

The average human soul, as the "eternal pilgrim," has by this time passed through all conceivable joys and pangs during its journeyings through all forms of evolution, and now that it is laden with the sympathy and experience of the ages, it is capable under certain conditions of appreciating and enjoying in one instant of time the whole retrospective panorama of life through which it has passed. At such moments of release from the bondage of the body it can also enter into vision and prospect of the divine life which is its own realm.

The Music-Drama in which all the accessory arts have their proper setting is an ultimate form of the highest expression of feeling. It is the only form which affords all the manifold opportunities for combined effects of scenery, tableaux, music, rhythm,

induces to much greater freedom of acting. A singing actor, when unrestrained by theoretical and mechanical limitations, is able to display more spontaneity, as well as greater ease and naturalness in gesture and poise than a speaking actor. Illustrative music supplies while it bridges the gaps in the continuity of sound, stirs the imagination and suggests unlimited applications and meaning to gestures.

We have had delightful examples by some impersonators of the noble characters of Wagner's operas. A more suggestive situation can hardly be imagined than the innocent soliloquy of Siegfried at the beginning of the second act in the Music-Drama by that name. The actor impersonating the hero needs but to respond with the simplest gestures to the sublimely idyllic musical setting to transport the

previous sweet notes still linger, being carried on the wings of a most wonderful tonal effect. At this point there is crowded upon the hearer such a wealth of emotion that he almost fears to breathe.

Imagine, then, in the Music-Drama, while the eye is fascinated by such perfectly simple and natural moving pictures of acting, the same enhanced by musical declamation and even mystically interpreted by telling descriptive orchestration, what flights of the imagination are not thereby made possible for both actor and audience. It is capable of calling up to memory every possible corollary of forgotten emotions from the remotest past and of opening up vistas of yet unexperienced delights; and all true to the last, telling of Nature's mysteries. E. A. NERESHEIMER

### Rāja Yoga Comradeship

TRUE comradeship is the expression of soul-life. The voice of a Rāja Yoga comrade is the voice of the warrior calling to arms—no flattery there, no negativeness. It is the voice which urges "UP and forward! Should the path lead through Gethsemane or Paradise what matters it, so that it be found and kept, that path which leads straight to the land of the free—the Isles Blessed!"

A Rāja Yoga Comrade seeks perfection in another as he seeks perfection in himself, the other's welfare being dearer to him than his own. The heart's behest is: "Live and act as a god—nothing less." The student who, through experience, has gained some knowledge of the true life and of spiritual freedom, cannot submit to slavery or delusion in any form either for himself or for his other selves; nor will he consent that the dear voice of his friend which has given utterance to the soul in true and inspiring words calling forth joyful response in other hearts, shall hereafter drop to a lower key.

H. P. Blavatsky once quoted from a certain ancient Book of Rules the following:

Before thou [the Teacher] shalt impart to thy disciple the holy words of *Lamrin* . . . thou shalt take care that his mind is thoroughly purified and at peace with all, *especially with his other Selves*. Otherwise the words of Wisdom and of the good Law shall scatter and be picked up by the winds.

In comment she adds:

The "other Selves" refers to the fellow students. Unless the greatest harmony reigns among the learners no success is possible.

Rāja Yoga Comrades, scaling the same heights, facing the same fire, fighting the same foe, with the one Living Power in the heart, asking nothing and giving all, strike a new note on the sacred lyre of love and friendship. In human life there exists no tie stronger, none more divine than that which unites comrades such as these. M. V. H.

### The Higher Trust

THE higher trust is positive, impersonal, and conscious—not negative, nor personal, nor blind. It is a power of the soul, and bears to it the same relation as does knowledge of finite things to the mind which works through the brain. When this knowledge passes through the brain it becomes trust, for to the lower mind it is this; and the influence this finer soul-force can exert over the evolving character depends upon what it finds in the brain-mind, and with what it has there to mingle itself.

Dogmatic theology and dogmatic science have put such obstructions in the way of soul-

ĪŚVARA is spirit, untouched by troubles, works, fruits of works, or desires.

In Īśvara becomes infinite that omniscience which in man exists but as a germ.

The soul is the Perceiver; is assuredly vision itself pure and simple; unmodified; and looks directly upon ideas.

For the sake of the soul alone, the Universe exists.

The mind is not self-illuminative, because it is an instrument of the soul, is colored and modified by experiences and objects and is cognized by the soul.

When the understanding and the soul are united, then self-knowledge results.

—Yoga Aphorisms of Patanjali

light that the real meaning of trust and faith has been lost. It is a travesty of the real thing to call it blind, for blind faith will never lead anyone into the light, but will keep one wandering in darkness. The ideal of negative quiescence which has been held up by some degenerate religions makes one who has the least idea to what it opens the door, shudder with horror. Man has to progress by his efforts. There is no power standing above him to do all his work for him, to lead him along

blindfolded, nor can he expect anyone to protect him from evil, while he sits down to take a short-lived, ignorant enjoyment. This is surely not the meaning of the Higher Trust; and any religion which inculcates this brands itself as having no interest in the saving of souls, but a very active interest in confusing and confounding them.

The real trust is a most positive quality. It implies an absolute belief in the Higher Law; a wish that this should prevail; a determination to work with it, and not impede it, and a conviction that if this is done (no matter what the seeming may be) all will be, *must* be, well. Therefore there can be no anxiety about results, for the results are already established in the act.

Anything less than this is temporizing with evil, and there comes anxiety regarding results. It means that the one who feels this is holding on to something in his nature which is personal and selfish. The soul knows under these conditions that the results cannot be perfect, and so comes anxiety. The Higher Law can work to perfection only when it is unimpeded. Even a little thread of evil can annul its work, just as a tiny grain of sand can arrest the movement of a mighty machine. And it would be absurd to trust in perfect results when the conditions for perfection have not been fulfilled. Yet the Higher Law *can* be trusted to adjust what is wrong in its own way. And therefore, one who truly desires to work with it, cannot be anxious as to results.

But the conception that the Higher Law is one thing, and we quite another, is wrong. The Higher Law is the expression of the Will of the Absolute, and we, being a part of this, are, in essence, a part of the Higher Law. A Law cannot work on nothing. It must have instruments. And so far as we are concerned, it cannot work to our benefit unless we so will it, unless we co-operate, lend ourselves, in other words work with it. When we do not do this, it means that all down our nature,

from the highest to the lowest elements, we have placed obstructions to the working out of the Divine Will. And this being in us—a part of us—it must work, *but first it must work to the tearing away of these obstructions.* And as we confuse ourselves with all these elements, seemingly it works to the destruction of ourselves and we have pain and suffering. Then there is no trust, or it is weakened to the extent that we have placed obstructions and identified ourselves with them.

He who possesses the truest trust will not lie back in complaisant ease, expecting the Higher Law to carry on his evolution for him and adjust what is wrong in his environment without trouble to himself. On the contrary, he will become an agent for its working. He will be of the most positive type, finely sensitive to its leadings and ready to follow them to the limit. And he will know it cannot do its fullest work unless he (who really is *it* in action) also does *his* utmost.

When these conditions are filled we see the Higher Trust in its perfection. Probably this is only possible to the fully awakened soul, but the only way to become fully awakened is to awake—to do the best one can.

And then are the doors opened for help from those Higher Powers who guide our evolution—as a teacher does a pupil—and who can only teach those who are willing to learn.

But to keep the doors open and allow the light to pass through, it is necessary also to be positive regarding the obstructions. If the soul-knowledge or trust meets a brain full of personal wishes, it is as if a higher force encountered a number of other forces pushing in different directions, and the resultant cannot possibly lead one in the straight path. If it finds a brain full of preconceived opinions and holding them tenaciously, what can soul-knowledge do? It cannot make a mind grow which is determined to stay small.

Equally, if it finds the mind impregnated with false sentiment, it is impossible for the power of discrimination to work. By constant vigilance, the mind must be kept clean of all these things, for the Higher Trust cannot make itself felt in a mind which is diseased, and without it, a soul is like a rudderless bark on the ocean of life—a helpless wanderer in the night of ignorance. M.

### The Chinese Wife in America

THE Chinese Minister in America, Wu Ting Fang, recently addressed an immense body of his countrymen in New York City. He enjoined them to combat gambling, opium-smoking and the drinking of liquor; and he took the husbands to task for not having made the position of Chinese women in America a happier one. Said he:

If I were to advise, I should advise you first of all to consider the happiness of your wives, and then—to obey them, for their lives should be happier than they have been in the past. And a good man will obey his wife, who is often in a better position than he is to see the bad effects of gambling and indulgence in opium. STUDENT

### Jottings and Doings

A CALIFORNIAN daily, at the end of a long article describing the crimes (robbery and a series of most cruel murders) of a certain woman whose crimes were recently exposed, adds:

The pastime of murder did not interfere with Mrs. Gunness' religious duty. When she had completed a butchery she would wash her hands, dress herself neatly, have the horse hitched and drive with her daughter of a Sunday morning to the Methodist church in La Porte, where she was a member in good and regular standing. She did not go every

Lomaland Photo. and Engraving Dept.

### SAN GIOVANNI DEGLI EREMITI: PALERMO

Sunday, but in so far as her fellow members could see, she was present at divine worship as often as the weather and her duties as the mistress of a sixty-acre farm would permit.

Her voice, deep and rather pleasant, and as became a woman of her large, powerful build, swelled above the other voices in the joyous songs of praise. Her face was benevolence itself. The pastor admired her as a woman of courage and determination; she was looked up to and respected by every member of the congregation.

We need something besides dogmatic theology if the world is ever to be saved, or humanity protected—evidently. Hypocrites, knaves and vampires stalk abroad in every community and not until their paths are literally strewn with victims does this or that community wake up. How long would the careers of such creatures as these last, think you,

if people knew *human nature* as well as they know their Kant or their Gray or their "Lives of the Saints"?

But human nature is a book that is being deciphered at last for the world's reading. It is the great study of the true Theosophist—this mystery that expresses itself in word, in look, in deed, and whose glyph is written plain as day upon the human face, in the voice, in the very turn of hand or of eyelid, in that indefinable something *beneath all this* which attracts or repels, mystifies or throws off guard—and only the Theosophist can read this glyph. But by "Theosophist" we do not mean any or every one who may happen to know a little Sanskrit or who can swell his chest out and talk by the hour about "Theosophical ethics." There have been such, whose influence, fortunately, is as limited as their brains are empty. We mean a true student of Rāja Yoga, one who has disciplined his life into purity and strength and has actually reached a point of knowledge and a capacity for impersonal service. "The wise," says the *Zohar*, "can read the mysteries in the human face." Unless the wisdom of the wise is at least brought within reach of a part of humanity, wedged as it is like some poor floundering thing between the twin destructive forces of its ignorance and its desires, what hope is there? Occurrences such as this are a severe indictment of those who claim to be qualified as leaders and teachers of human kind. Should not the shepherd be wiser—at least on the lines where he claims wisdom—than his flock? STUDENT

THE very essence of Rāja Yoga may be felt between the lines of the following little extract from a letter written in the early days by Mrs. Garfield to her husband, our martyred President. (*Italics mine*) STUDENT

I am glad to tell you that out of the toil and disappointment of the summer just ended I have risen up to a victory; that silence of thought since you have been away has won for my spirit a triumph. I read something like this the other day: "There is no healthy thought without labor and thought makes the labor happy."

Perhaps this is the way I have been able to climb up higher. It came to me one morning when I was making bread. I said to myself, "Here I am compelled by an inevitable circumstance to make our bread this summer. Why not consider it a pleasant occupation and make it so by trying to see what perfect bread I can make?"

It seemed like an inspiration and the whole of life grew brighter. The very sunshine seemed to be flowing down through my spirit into the white loaves and now I believe my table is furnished with better bread than ever before, and this truth, old as creation, seems just now to have become fully mine: That I need not be the shrinking slave of toil, but its regal master. . . .

Now I wonder if right here does not lie the "terrible wrong," or at least some of it, of which the woman suffragists complain. The wrongly educated woman thinks her duties a disgrace and frets under them or shirks them if she can.

She sees man triumphantly pursuing his vocations and thinks it is the kind of work he does which makes him grand and regnant, *whereas it is not the kind of work he does but the way in which he does it.*

# OUR YOUNG FOLK

## MIDSUMMER NIGHT

Lomaland Photo. and Engraving Dept.

### Midsummer Night

ONE might still dream in sun-warm midsummer-time, when all the world is full of beauty. The hum of bees, the rustle of leaves, the fragrance of a thousand flowers are bridges to the dreamland world.

I saw nothing strange—just flowers and trees, grass and bees, butterflies, birds and beetles; and I could hear only a little brook laughing and giggling as it jumped the rocks.

Only the brook! The brook was alive! Nymphs were at play; quick as lightning their shimmering forms dashed over the rocks, hid behind them, out again, playfully throwing armfuls of glittering beads high in the air,

"Catch us quick, sunbeam fay!  
We know the trick to hide away.  
You're waiting to catch us on top of the rocks;  
Just try!  
We throw diamonds and pearls on your golden locks,  
And fly!"

Voices came now from flowers, trees, air, water,—everywhere surprised exclamations!

"A human! A human!" "Is it of those we are waiting for?" "Hie! Hie! Bring hither the testing-stool!"

As I listened and wondered, an elf stood before me, saying with a deep bow: "Mortal Highness! What kind of wings are you accustomed to use?"

I felt ashamed to confess the truth, still answered frankly: "I have never in my life had any wings." At this he instantly sped away, and I heard the elves and fays chatter nearby, like birds in the early morning.

"It has no wings!" "What has it done to be doomed wingless?" "The creeper must be harmless, let us use it for our sport!"

"No, no! Be cautious! Some of them are said to be very powerful."

"Is that why they cannot have their wings?" "Have they done something to offend Queen Nature? How terrible then is their fate!"

"Ignorant elves! what are you now speaking of?" said a sweet fairy voice. "The humans have wings, swifter than any one of you can ever hope to get."

"But this one told us that it never had any."

"This one is, perchance, of the blind, common kind. They live in houses called bodies, which the air, water, fire and earth fairies

help them to build. From being blind, they believe that they themselves are the houses; just as if Fairy Bluebell here were to think of herself as being the flower which she is using as a dwelling."

"How very funny!" and the air got so full of fairy laughter, in all different colors, that it dazzled my eyes. But I was too interested in the conversation to feel offended at being laughed at, and strained myself to lose no word.

"The mortal really meant that it had no wings to its house," explained the wise fairy, and again the air was filled with rippling laughter. "Is this the kind of human which all fairyland is waiting for?" questioned a mocking voice.

I tried to hear the answer, but glancing off, I saw that I was surrounded by curious elves. All their features were insignificant, except enormous ears, large as half their body; they all stood with necks stretched and mouths open, as if ready to swallow every word. I felt disgusted, but could not turn my eyes away; and as I looked their ears grew smaller, while the one eye which they had, grew so big that it covered the whole face, and every eye stared at me.

I felt uncomfortable and wished to be free from them, but did not know how, and they started to chase each other around the place where I sat until my head spun round. Oh! I had lost my chance to hear more about the "humans whom all fairyland was waiting for."

Marching on came a solemn procession of gnomes, bearing a strange-looking seat, and my tormentors disappeared. I was motioned to take the seat and heard a voice say: "Call the tribe and let the judges take their places."

Opposite my place appeared twelve judges, seated on red tulips. They all scanned me with gravest dignity. One, with a great document before him, rose from his seat and spoke:

"Mortal," said he, "it is the custom in our land, whenever one of your kind appears among us, to have him seated on that magic testing-stool on which you are now sitting. We will now call before you the tribe of fairies, elves, and sprites belonging to you, that you may, before our judges, exhibit your power in the following points:

What kind of fairies are you keeping in

your service? What elves do your bidding? How are they being trained?

What use are you making of their services?

If you succeed, according to our law, a festival of great rejoicing is held throughout fairyland."

I wondered what was the reason for all this, and would have asked the judge had he not looked so stern. Now he gravely waved his wand and instantly appeared a great crowd of fairies in all shapes and colors. Some were light and beautiful, some dark and ugly; many were misshapen, some came limping on crutches, creeping, running, or rolling, others flying on beautiful wings. A great many had only big mouths in their faces, and kept chattering all the time, others had only ears or eyes, some had body only and no head, some came rolling with all head and no body.

Imagine my feeling when they all crowded around me in the most familiar way. I wished to select the beautiful white ones, who were waiting patiently in the background, and have them help me to drive the ugly ones away; alas! I could not make my voice heard above the noise of the others.

"You want to play with that elf in the gilded coat; he is doing tricks," one imp said to me. I really did not want to play then, but what could I do? They all crowded together and started the game, and before I knew I was right in it.

"Now you want to read this funny book," another one said, and he started to read and laugh; I could do nothing but listen, until some one else whispered: "Throw the book away! Your life is sad. You are all alone, with no friends to love you." Tears trickled down his hollow cheeks; I felt very sad, and what could I do but cry too!

"You are tired. You want us to dance and sing to you," said the next one. They all commenced to dance in the wildest disorder, tumbling over each other; they sang each a different song at the same time, until my head whirled. I did not want to have them do it, but how could I get them to stop—there were so many of them!

An ugly imp, with a long nose dragging on the ground, came and said: "You want to say something bad about your neighbors; they

Lomaland Photo. and Engraving Dept.

## FAIRY HELPERS

will never know, and others will see how much better you are than they." He started to talk, and his lips dropped poison,—but then I screamed out; "No, I do not want that! I do not want it! Away!" Instantly the ugly imp disappeared, and a white beautiful fairy stood by my side. I felt safe and happy when I clung to her; she called her companions and said to me: "You are strong and mighty, you can command those others at will. They will then become fairies like us and serve you. Now, do not look at them whatever happens."

"Yes!" I heard a voice say, "you can command us easily. Look at us!" I did not mean to disobey the advice of the white fairy, but thought it would not do any harm to look a little, sideways. There they stood in fine orderly rows, looking very submissive. Woe to me! Before I knew it I was again surrounded.

A signal was heard, and they all disappeared. The trial was ended; I saw the twelve judges on the seats looking at me with grave sad eyes.

All was silence about. How I wished to have the white fairies with me! How truly I would follow their advice now! But they were nowhere to be seen. I was too timorous to call them, after my weak yielding to their enemies. Would they ever trust me again?

The judges still looked at me with sad eyes. Their eyes haunted me. Why need they be sorry over my failure? Now a soft solemn song reached my ears from somewhere:

"Fairies' beauty spoiled by you!  
Tears are mixed with pearly dew.  
Human, hear us!  
Sweetest music, purest joys,  
Mixed with discord, drowned in noise.  
Human, hear us!  
Smiling Hope, our dearest fay,  
From you is fleeing far away.  
Human, hear us!  
You, who through the ages long,  
Learned to judge of right and wrong,  
Human, hear us!  
You alone can make them light,  
Mighty judge of wrong and right!  
Human, hear us!"

The song died away in the distance, and I arose and followed. "I hear you! I hear you!" I cried. "O, what shall I do?" Again a song, but clearer and sweeter than before:

"Winged soul, who light and fleet  
Sees regions we may never greet!  
When from blessed heights again  
You return, O, let us then  
Fly your errands! Fly and give  
God-send gifts to all that live.

Where your blinded brothers sigh  
Let us speed, their tears to dry!  
We'll bring your thoughts of peace and light,  
To hearts that bleed in weary fight.  
Where the evil wishes breed,  
Or the black-elves sow their seed;  
Love and truth, at your command  
We will plant with fairy hand."

Farther and farther the song had led me; my heart was filled with longing to help all the people on earth and all living beings, and I called: "White fairies all! I need you! I need you!"

In the next moment I was surrounded by beautiful fays, whose star-eyes shone with kindness. Over their foreheads each had a burning light. One said, taking my hand:

"Come! You are permitted to see the work of the fairies, who obey the highest humans. When you return to your house we shall be with you, if you still desire our services."

"I shall always want you," I said.

"Yes, as long as you do not listen to our enemies," she answered.

"Not one of them is here!" I observed in surprise.

"The air is too pure for them to live in. There are no thoughts of selfishness, hate or fear in it, and without those the evil fairies can not breathe."

A great lovely meadow opened before us. There was busy life everywhere. Gigantic trees stretched their strong branches far out, and little flowers grew at their feet. From one of the trees came strains of sweetest music; at the root sat a beautiful nymph, spinning to the rhythm of a song:

"Spin, spin silken strands,  
Weave the cloth with fairy hands.  
Sun and moon and star-beams spin,  
To wrap a baby human in."

Elves, nymphs and fays from wood, sea, mountain, and air; the dryads of the trees; the naiads of springs and brooks; all brought their gifts to the nymph, to spin for the baby human's wrapping. Then came other fairies, more beautiful than the rest, showing that they were guardians of high trusts. Said one:

"Music and story  
Bring I along.  
Forefather's glory  
In saga and song."

Another one:

"Here his every noble thought,  
Preserved and wrought  
Secure in seeds;  
To sprout and grow in noble deeds."

The next one:

"Here is love which he bore  
For his brothers of yore.  
Weave it in! Weave in all if you can.  
He will live as a blessing to man."

Thus gift after gift was brought; and the nymph spun and spun to the rhythm of song and music.

There was busy life everywhere. Some fairies put honey-drops in the flowers for the bees; others distilled the dew for the next night; some were instructing the birds in building nests. There were some fastening the frail tendrils of an unsupported vine to the branches of a tree, while many were building flowers; there was a tiny fay living in each one. Here a faithful horse was feeding on the grass; the kind fairies were all about him. What do I hear? Children at play!

A signal brought a host of fairies to where a chief among them sat waiting their reports.

"Is everything ready for the Midsummer festival, as our king has ordered?" he asked.

"My last leaf is finished," said the dryad of the oak.

"My fruit is ready for the sun-fays to ripen," said the dryad of the apple-tree.

"My flowers are long completed, and the seeds ready to ripen," said the fairy of the wild rose. "My helpers, the bumblebees, have been carrying the pollen from flower to flower, and all is ready."

When all had reported, said the chief: "All well! The season's work is ended. Let the joy tones ring in every hidden nook! Hail to the Sun! Hail to the King, high in his power!"

"Still! First may we fulfil our customary duty, at the king's command." A number of shining fays were instantly at his side.

"Go, as is your wont to the world of mortals! Touch their lips with fairy finger, that each may receive the blessing of silence. The righteous who feel the touch, obey; their hearts are made happy, for their eyes see nature's secrets."

A song was heard as the fairies sped on their mission:

"Silence! O, Silence! Strong is thy power!  
Gentle thy reign. O, be with us again!  
Silence! Sweet Silence! Now is thy hour!  
O, put of thy balm in the heart-life of men!"

A silence fell over fairyland; a silence full of sweetest fragrance and softest colors. A signal! The Midsummer festival was beginning.

All too soon the hum of bees, the rustle of leaves reached my ear—I was back from the dreamland world!

HUMAN

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogenesis  
Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

### The Mystic's Door

A RECENT VOLUME, one of a series dealing with contemporary men of letters, in this case an Irish mystic, raises the whole question of the relation of morality to mysticism. The appearance of a school of mysticism which professes no relation to morals is probably a phenomenon exhibited by every civilization in its decay. Our own times show sporadic examples of such mystics in fair numbers, as well as some schools of even quite definite organization and leadership.

We find ourselves shut in to a little personality. The great majority of us are content; we do not want to burst the shell and get out into a greater field of knowledge and interests.

A few are not content; they want a richer volume of feeling than the life of the personality can generate. To get it, some press outward into the world of men; others press inward into the world of feeling itself. These latter are the mystics. Inward, they find, is the door that leads into the vast inward of nature. By accentuating a feeling they strive for wings that may carry them through it. They succeed or fail according to the meaning they give to the word *nature*.

The philosophy of mysticism expounded, though *not* advocated, in the volume in question, will have it that it makes no difference what feeling is thus intensified. Any will furnish the wings for the passage through the door into the spacious field beyond.

From it [this philosophy] comes also the doctrine . . . that man should abandon himself without restraint to the passion that rules in his breast. And this doctrine is justified by the conception of the soul as an entity distinct from the body, and incapable of being soiled by the sins of the body. Morality is a practical matter, based upon the small prudences that make for the body's well-being. With this the soul has no concern. On the contrary it is on the wings of intense and unmixed passions, as well as in meditation and trance, that the soul escapes into an immortal state of pure being. Man, then, should follow the devices of his heart, good or evil, as the chance may be, with the wings of the wind; for spiritual happiness overtakes those alike who have sought it in asceticism, or abandonment to desire, "even in the Holy Sepulcher, or in the wine-vat."

### "Sensation the Gate to Heaven"!!

The soul, we are told correctly enough, is an entity distinct from the body. Yet though thus distinct, and finding its highest joy in an escape from the bodily prison we also learn that in utterly merging itself in some bodily

passion—even the "wine-vat"—lies the path to this very joy of freedom! *Through* the "sins of the body" it achieves "spiritual happiness," escapes "into an immortal state of pure being."

An immortal state! Merge yourself in the passionate enjoyment of the "wine-vat," and you will presently crystallize into a glorious and immortal wine-vattishness, which is also a state of pure being! It is the relation of this mysticism to insanity, as much as to morality, that the author should have discussed.

Mysticism is right in teaching that our moods are the limited expression of vaster antetypes in nature. It

### Searching for Emancipation

holds to a belief in one great mind, one great memory, the mind and memory of nature herself. Of this great mind and memory our minds and memories are a part, sometimes separated from it, sometimes passing over into it and bearing away treasures of eternal wisdom. This great mind is, first of all, the dwelling-place of the immortal moods, those "disembodied powers whose footsteps over our hearts we call emotions," the gods of an earlier, the angels of a later, dispensation, and the real rulers of the world.

There is no use in doing much dissection of that. The "moods" of nature, are only immortal if they become men and as such win self-consciousness and the power of self-guidance. Until then they are but the servants of, and within, immortal and Divine Nature, of whose final purposes they know nothing. It is only man, if he will, not they, that can know the universal mother. Some of these forces build for her; some destroy. But this mad philosophy, in teaching an alliance with them, draws no distinction. We need make no selection of mood; any passion will do. We can find immortality by attracting to ourselves the forces that destroy, that break downward into elements, just as well as by their opposites!

### "Immortality through Passion"

The confusion lies in the word *nature*. They use it for the conscious forces of nature, represented in us by emotions and passions. But by the same word the real mystic means the ultimate source, to be reached and known only by the destruction of all passion, the mergence of passion in *com*-passion. For Divine Nature can only be reached by furtherance of her purposes in thought and wish and act. That mystic who loses hold for a moment of the "small prudences" of morality, who leaves the narrow path of restraint and self-rule, who neglects the dictates of universal ethics, has taken

a destroyer for his mate, a destroyer of body and mind. The path to escape is not one of the passions of that from which escape is desired. Body cannot be transcended by means of itself. Immortality cannot be reached by the help of the mortal:

**Nature**  
**Herself is** the more than human by  
**Moral** resolution into, by return to, the sub-human and less than human. It was not for nothing, not for "vulgar consumption only" that all the world teachers began and finished with ethical precepts. The soul, truly, is not the body, but she has the body in charge. She demonstrates and achieves her distinction, not by yielding to it but by ruling it. If, instead, she encourages some one of its passional impulses, she has opened the door to the entry of a destroyer rather than to her own exit. She has elected to have her consciousness in that pulsation, and when the hour of exhaustion comes she finds herself still tied where she tied herself.

There are examples all around us of mystics who took this path. At the end of it wait the demons of suicide, insanity, morphinism and nameless debauchery. H. CORYN, M. R. C. S.

### Lost Pages of History

THE archaeology of Central Asia, some account of which is given in *Records of the Past* (quoted below), is proving that even in the Old World have been vast and complete civilizations in recent times, of which the pages of our history books are quite innocent. The great number of different languages spoken, some of them new, is surprising. It is also remarkable how the most divergent races and nations mingled. As usual we find that the traditions and records have not exaggerated but understated the facts. All this shows what a meager basis our knowledge of "history" is on which to dogmatize about the human race.

At Turfan, in Central Asia, about 200 miles north of Lop-Nor, lies a basin whose floor is below sea-level, while the surrounding mountains tower to heights of over 12,000 feet. Almost no rain falls, but mountain streams support some 50,000 souls. The former density of the population is attested by the number of ruins, mostly composed of adobe brick. Kara Khoja, the chief ruin, is surrounded by a thick adobe wall about 60 feet high and 2000 feet square. Outside Kara Khoja are numerous similar ruins. There are also several monasteries composed of a great number of rooms, many of which are excavated in the banks of the streams.

From Turfan, Kucha, and one or two less important regions, explorers brought to Germany over 230 cases filled with all manner of materials illustrating the ancient life of the Iranian and Turki people of Central Asia. In Turfan, unlike Russian Turkestan and the Lop basin, no evidences of extreme antiquity have as yet come to light. But manuscripts in a great variety of languages have been found, which afford "remarkable evidence as to the spread of artistic and religious ideas from India and Western Asia, through Chinese Turkestan to the Far East."

Most of the manuscripts found at Turfan are written upon paper, but some are on finely dressed white leather and others upon wood. They are in ten different languages, Nagari, Central Asian Brah-

mi, Tibetan, Chinese, Tangut, Syriac, an unknown tongue (which appears to be a curious variation of Syriac), Manichæan, Uighur, and Primitive Turkish. The manuscripts are now being deciphered and are attracting the deepest interest among philologists, who see in them not only clues to many linguistic problems but a number of most important new problems. It is most remarkable that here in a provincial town of far western China abundant manuscripts should have been collected in languages spoken in the remotest parts of the continent. Turfan must have been in close touch not only with the countries immediately around it, but with India, Persia, and even distant Syria, whence Nestorian Christians are known to have penetrated to China. . . . In the VIIIth and IXth centuries of our era there must have been a degree of civilization and communication in the desert regions of Central Asia vastly in advance of anything which now exists.

South of Lop Basin, the sand-buried ruins near Khotan and eastward give added evidence that

Near the beginning of the Christian era an Indian language and an Indian art tempered by Greek and Scythian influence had come across the Himalaya and Kwen Lun Mountains and established itself in the Lop Basin. At the same time Buddhism had been introduced.

The Buddhist ruins are of two dates. There is evidence of an earlier occupation, ending in the latter half of the 3rd century A. D., and of a later, ending about the close of the 8th. The first period yields documents on wood in the so-called Kharosthi language and in Sanskrit. Chinese documents are also found written on paper, and Sanskrit manuscripts on birch bark. From the later period come also documents on wood and paper, but the language has changed. Though the Chinese is still the same, the Kharosthi has disappeared, and there is an Iranian tongue which has not yet been deciphered. It is referred to by the Chinese officials as the "barbarian language." Besides these, there is a good deal of archaic Tibetan and some Sanskrit.

There were found frescoes showing classical influence so strongly that one would have expected to find them on a Roman villa.

### Technical Education in Japan

WHEN the Emperor of Japan came to the throne, he issued a proclamation that knowledge and learning should be sought throughout the whole world in order that the status of Japan might be raised higher and higher. In 1873 was founded the Imperial College of engineering at Tokyo, from which college have come the majority of engineers now working the resources of the country.

The teaching staff consists of 270 members, the majority being Japanese; but there are 15 foreigners, including Germans, Britons, Frenchmen, Americans, Austrians, Swiss, Italian, Chinese and Russian. There are nine courses of study, each extending over three years: civil engineering, mechanical engineering, naval architecture, technology of arms, electrical engineering, architecture, applied chemistry, technology of explosives, mining, and metallurgy.

Arrangements are also made for the practical training of students in Government or private establishments. The former principal, Mr. Henry Dyer, writing in the *London Times*, says, of the time when he was principal, that

the whole course was six years and included half college work and half practical work, the college being then in the Public Works Department. The diplomas were awarded on the results of a practical examination extending over a month. The students were placed under the same conditions as they would be in an engineer's office, and allowed the use of their notes and text-books, as the object of the examination was to test whether they could apply what they had learned, not to see if they could reproduce what had been crammed into them.

Some years ago a university was established at Kyoto which also includes a well-equipped engineering college. Besides these two, there are many smaller ones throughout the country.

In the Tokyo technical school there are six sections: dyeing and weaving, foundry work, applied chemistry, mechanics, electricity, and industrial designing; and an apprentices' school for the instruction of artisans in metal work, wood work and weaving. There are over 30 technical schools of different sorts in the country and about 40 apprentice schools, all under Government control, besides a large number of supplementary schools.

As a result of all this technical training, the roads of the country have been repaired and extended, railways made and shipping equipped. There were 18 miles of railway in 1873; now there are over 5000. At the end of 1906 there were 2021 steamers and 4497 sailing vessels, besides 21,920 sailing vessels of smaller tonnage. Lines of steamers run to all the more important ports in the far East and also to Europe, America, Australia, and Bombay; and posts, telegraphs and telephones have been introduced into all parts of the country. T.

### A Discovery

IT is rumored that in the north of Europe a scientific thinker has been discovered in possession of a clue to the meaning of radio-activity. The septenary law of Mendeleef, it is said, gave him the initial impulse. According to his view the density of the elements is under the sway of an irresistible law which operates throughout enormous periods of time. He asserts that long aeons ago root-substance or protyle was continuous and diaphanous in the highest degree and that in the inner spatial depths waves of heat and coolness arose from inner impulses which gave rise to the first stage of still subtle, but now growing discrete, substance. That other inner causes gave rise to germinating centers or world-nuclei around which successive waves of heat, moisture, and coolness, commenced to differentiate and objectivize root-substance. That every seventh great wave completed the formation of typical basic groups and was accompanied by the appearance of definite but subtle living forms. That these processes continue in increasing complexity and rhythm until a point is reached conditioned by the duration of a life-cycle, where the maximum density of some of the objectivized substance is attained. That this point of maximum density was reached in the solar system only a few million years ago, and that the return journey then began, the effect of which is most observable among the heavier forms of matter, those in fact which are radio-active. It may be that he has read *The Secret Doctrine*. J.

# Some Views on XXth Century Problems

## Moral Catalysts

THE subject of enzymes, catalysts, and ferments has been to the fore of late in the world of science, because of the immense importance of the question in commerce. Commerce holds the stage in the civilization of our day, just as in the times known generally and vaguely as "antiquity" other human interests occupied the limelight of men's attention. And as commerce is affected to the extent of many millions of dollars by the increasing applications of the properties of those chemical substances which by their mere presence induce action—just as alcohol is produced by ferments which lend no more than their mere presence to the operation performed—so public interest is forced to look seriously in this direction.

But are we to think that the wise ancients knew nothing of these things? Scarcely. Then why did the world not exploit this line of money-producing research before? Perhaps it did to a degree. Yet the genius of the ancient thought was not towards the production of so much cash, but the, to it, more important matter of human progress, the great journey of the soul towards perfection. Once this position is realized, many of the puzzles with regard to the ancient use of knowledge and the secrecy of the temples and the sages become clear. Even now there are secrets of medicine well known among certain classes, which are used occasionally but not commercially exploited in general, and which would be hailed as epoch-making discoveries by the scientific world—after submitting to the usual ordeals of all such: discredit, ridicule, adoption without acknowledgment, and the rest.

The line is very, very thin, and the materialists of thirty years ago are being forced to a point where the despised wisdom of the ancients, so boldly upheld by the voice in the wilderness—Madame H. P. Blavatsky—will be justified of its children. They spoke, vaguely for the masses, and for us, of "powers," "genii," "elemental forces," which could be controlled by knowledge wisely (or unwisely—hence the silence as to detail) used. There are names innumerable for the forces innumerable which are amenable to human direction through the right means, and science is on the verge of discovering that medicine is a representative science using magic keys to rub, to call into action the forces of nature.

But we must look, also, for the moral expression of such catalytic processes in human life, and finding the unmistakable evidences, many a problem may be solved. And perhaps one phrase of the "jargon" of the wise old alchemists may become clearer, justifying their methods of expression, whose object was (and is) to heal the world and conceal the process from all but the few capable of reading their cryptographic symbol-language. The process of "mixture, precipitation, and separation" is well known in human progress, from the larger point of view, and the "powders of projection" on the mental and moral planes are very marked in their effects, although the

causes underlying may be seldom suspected.

There have always been alchemists in the world. Perhaps the best-known (in the West) and least understood is Jesus of Nazareth. Of a character pure and purposeful far beyond the ordinary conception of human possibilities of attainment, an example of the divine in man in actual control of the organism, we find the curious fact that he stirred up strife and the enthusiasm of altruism by his mere presence, or by the repetition of the commonplaces of the sages who had gone before him—for there is very little, if anything, in his public teachings which was not already part of the popular wisdom of the Orient even then quoted as the teachings of other World Saviors; and most of it, were it pronounced by a mere sentimental preacher of no particular force or purity of character, or by a vain materialist insincerely seeking adulation, or by any ordinary character, would sound insipid enough to an unbiased mind.

Following the clue, we find the same in every case of which we know anything of the great world-saviors. Their simplest platitudes stir up fierce antagonism or tremendous enthusiasm.

May it not be that this is on the moral plane the catalytic process at work? What is this thing that makes the simple words, the untrained natural gestures, the expression in a foreign tongue of a helper of the nations such a power that the memory thereof persists through centuries? Other people do the same thing and afford a night's entertainment—and that is all.

Jesus in the short three years of his mission was able to say very little. His audience was unprepared, and enough harm has come to the world in the name of religion from the little he dared, in view of their unpreparedness, say. Guarded as his language was, we may yet sense behind some of the words the longing to find some who could understand and use the deeper truths, those which he could not teach "to the multitude." And behind the simple words that "Where two or three are gathered together in my name (the name of the Christos) there am I in the midst of them," some may suspect a reference to the actual fact that where there is a meeting of two sincere unselfish souls working for the world's spiritual progress, there is generated in greater or less degree the force of the Christos which force continues to exist and do its work as a catalyst, untouched and undiminished, "establishing a universe with a portion of itself and remaining separate." P. M.

## An Infectious Disease

A CONTEMPORARY reminds us that in a certain little city in Kansas, during 1901, an epidemic of suicide broke out. The rate rose from 90 to 1665 per million. The mayor noted the figures and did some strong clear thinking. He thought that the word "epidemic" was perhaps no metaphor at all, that he had to deal with a real disease. Now an epidemic disease is infectious. If physical, the medium of contagion

is usually the air. What is the medium if, as with suicide, the disease is mental? He noted that the newspapers gave the minutest accounts—doubtless with photographs—of the cases, the mode of self-slaughter selected, and so on. *It was the newspapers that constituted the medium of infection!* They must therefore be aseptized, which in this case meant forbidden to publish their accounts.

Said this extraordinary mayor:

I have consulted the board of health, and if the papers do not comply with my request I shall have a right to stop, and I will stop summarily, the publication of these suicide details, under the law providing for the suppression of epidemics.

"Psychic suggestion" was his view of the trouble. His view was correct and his finely dictatorial procedure ended the epidemic. Now three-fourths of the murders which annually disgrace our country, are the result of this same psychic suggestion. The suggestion is mostly administered to weak and criminal natures in the print and woodcuts of the journals, though there are some subtler paths. Why should they not be compelled to aseptize themselves? As they are, no alienist, no police authority, no commonsensed thinker, has the slightest doubt of the noxious work they do morning by morning. Very well. . . .? H.

## China's Filtrate from the West

AT a recent meeting of the (English) Christian Literature Society, the chairman, urging the further flooding of China with Christian literature, said:

China now recognized that we were leading, and she had made up her mind to equal us. She also realized, though not completely, that our civilization depended on our religion.

Suppose this true; suppose that China has recognized that we are leading; suppose that she has made up her mind to duplicate our civilization in her midst. Having done her best to understand it, she proceeds to imitate. How? What is her first move?

To increase her fighting efficiency! And her second? To teach her young men our Western science. Indubitably, fighting and science are for her the keynotes of our civilization. If not, what? Religion? Is the reverend chairman right? According to him, our civilization seems to the Chinaman to rest on our religion. And yet, when he decides to imitate, the fruits which he begins first to transplant are—armaments and science. The chairman must make his own reconciliations.

As a matter of fact the Chinese suppose, rightly or wrongly, that they can filter, that they admit to their country whatever is useful (such as science), or to them—since they are to deal with our methods on equal terms—necessary: namely armaments and Western military paraphernalia. They will only welcome our religion on condition that we can prove to them that our "civilization" is the result of *departure* from our Western spiritual Teacher, Jesus Christ.

Believing true religion to be the producer of inner peace and light they probably refuse us the possession of it or of civilization. C.

THE RUWANWELI DAGOBA ANURĀDHAPURA, CEYLON

## Anurādhapura, Ceylon

THE building of this stupendous monument was commenced about B.C. 161 by King Duttha Gāmini, and was completed by his successor, Saddha Tissa, in B.C. 140.

The present height is about 150 feet, with a diameter of 379 feet. It is now being restored under the superintendence and through the efforts of the zealous and enlightened priest who is the present incumbent.

Some thirty-six years ago, this priest, then quite a young man, was obliged to cut his way through dense jungle, the home of wild elephants and poisonous snakes, to reach the scene of his life-long labors. Now the jungle has been completely cleared, the lower platforms of the dagoba excavated, and the re-building is making sure, if slow, progress. The funds for this work are largely derived from the pious contributions of pilgrims, some of whom bring 10, some 20, or even 100 bricks, while others bring money offerings.

E.

## Boundless Possibilities of Archaeology

IN an article on "Objects and Methods of Archaeological Excavators," in *Records of the Past*, Dr. Aug. Koester of the Berlin Royal Museum brings out some points of interest to the student of antiquity.

He says of the objects dug up that "to this day

they are of the greatest value as unequalled models to our artists and artistic workmen." Surely this is an admission—and who can gainsay it? regarding the ancients that amounts to a great deal. For is the ability to produce great original works of art that cannot be surpassed and that serve as a model for all future ages an isolated ability, or does it imply commensurate ability in other directions? One would say that a people who were backward in other ways could not be so forward in art, and that this consummate artistic ability implies a fully developed culture and well rounded character. To be consistent we ought to credit the ancients with abilities proportional to their artistic achievements. Again he says:

"In comparison with what once existed extremely little has been preserved."

Say rather "has so far been found." For since we began to look for things we have discovered many more than were ever dreamt of. And elsewhere in the article it is shown that huge finds are continually being made and are likely to be made at any time. But, granting the proposition, let us draw the inference that the smaller the proportion of what has been preserved the greater must have been the original. If what has been preserved of the Egyptian temples is so small a portion, how great must those temples have been? How paltry an idea the dreary ruins of an abbey or the shell of a dis-

mantled house gives of the splendor and luxury of the original! What then must have been the magnificence of the Egyptian temples and cities when they were furnished and inhabited, and by such a race of artists and craftsmen?

Again, think what would be left of our civilization. All the chief materials, wood, iron, and paper, would be long dissolved, and the few stone remains would be pitifully small compared with what ancient races built. Indeed, so far as evidence goes, civilizations such as ours might have risen and decayed time and again and we none the wiser. Speaking of hidden treasure, the writer says:

"At Hissarlik, Vetersfelde, and Petrossa, in Roumania, for example, were found great treasures in gold, and at Boscoreale was dug up the famous silver find, which is now the most prized possession of the Louvre Museum at Paris. Bronze treasure too . . . is awaiting its resurrection. Near Bologna, for instance, there were found 14,000 bronze utensils, for the most part inclosed in a single huge vessel."

Chance plays a very important part in these discoveries, and the writer says that in archaeological research "a little luck is needed." This shows that we can make no certain inferences as to what may yet have been preserved that we have not found, but that may turn up at any moment. The cautious student will do well to remember this. STUDENT

# ✻ The Trend of Twentieth Century Science ✻

## The Origin of Continents and Oceans

AT the last meeting of the British Association a noteworthy paper was read attempting to account for the irregular distribution of land and water, from certain theoretical considerations. These included the idea that the center of density, and hence of gravity, of the ellipsoidal solid part of the earth, took up an eccentric position, at a time when the mass was gravitationally unstable, and remained there during the subsequent period when gravitational stability, due to the hardening of the rocks, had been reached.

In order to follow out this train of reasoning it is necessary to consider the positions of a contour such that the area of the land above it should be roughly equal to that below, and such a contour exists at a depth of about 1400 fathoms below the surface of the ocean. After assuming that the eccentric center of attraction in the solid ellipsoid (which eccentric point would however be the center of the fluidic geoid, or equipotential mean surface of the sea) occupies a certain position, the result of spherical harmonic analysis showed that a contour bearing considerable similarity to the actual 1400 fathom contour would be the result. The actual elevations and depressions were not, however, found to agree very well with the theoretical treatment outlined.

But if there have been colossal changes in the distribution of land and water long after the time when the rocks reached a condition of gravitational stability, the inference would be that there must be other causes operative besides those considered; for it is not only a question of distribution of areas above and below contours of differing positions, but of elevation and depression also. The shifting of the position of the geoid due to an increased polar ice cap during a certain period of maximum orbital eccentricity, say 850,000 years ago, may be competent to account for the raised beaches in the world, but neither this nor a fixed center of density would explain the sinking of the remnants of Atlantis at about that period, to an extent more than ten times the extreme variations in the height of the geoid. Nor, to come down to recent times (although 850,000 years is geologically recent), would these considerations account satisfactorily for the submergence of Poseidon to its present depth, some eleven thousand years ago.

It seems fairly obvious, looking at a contour map of the earth, that the center of gravity of the solid ellipsoid must be eccentric, but, the limitations of pressure and compressibility notwithstanding, it is not perhaps so certain we are justified in giving the center of density a fixed position. We know too little about the interior of the earth as yet, we of the modern world, that is. The contour-map a million years ago was very different from now, and the center of gravity must therefore have been in quite a different position. And when the ocean floors were broken and Atlantis, occupying an area the size of Africa, was engulfed, the center of gravity must again have changed. Therefore to assume a fixed center

of gravity, as the result of a fixed position of maximum density, may be found an untenable hypothesis, as the author of the paper himself suggested.

The interior resistance to compression, upon which the idea of a fixed center of density is based, is arrived at from the velocity of propagation of earthquake shocks through the interior (another set of vibrations following round by way of the crust). Yet this may turn out to be a somewhat uncertain line of reasoning. On the other hand this very able paper showed that granting an even comparatively stable position of an eccentric center of attraction, there should be tendencies in some regions making for elevation, and in others for depression, from dynamical considerations.

The resources of mathematics are certainly wonderful and far from reaching finality, they point to indefinite expansion in the future. Perhaps the full significance of the negative sign in its application to physics has not yet been realized. For do not all our ideas about gravity stand in urgent need of revision? An apple falls to the ground because — it wants to. And if a man unfortunately happens to fall, it may be because, having in some way lost his equilibrium, he thinks he cannot help falling to mother earth. But if there be but a single instance on record where, owing to the presence of some unusual force or polarity, he has an actual tendency to rise from the ground without muscular effort, and does in fact rise — while the mathematical laws of acceleration would not thereby be affected, the category of known forces or manifestations of polarity would have to be extended, and the number of their modes of interaction increased. The entire theory of the forces connected with gravitation would have to be revised, the behavior of the apple having been found insufficient to account for the gravitational problems of either the earth or the cosmos.

Until science approximates to the standpoint of Theosophy, and recognizes that behind all manifestations of attraction and repulsion lie will and intelligence, her efforts to account for the origins whether of continents or flowers must ever remain but the lunar shadows of the great realities.

F. J. DICK, M. INST. C. E.

## Design or Chance?

PROFESSOR WILSON of Columbia University, in a recent remarkably candid lecture, sketched for his hearers the problem of design or chance in biology. Design is finding more and more support in biological circles. Some think that the whole evolutionary march implies a *general* cosmic design to explain it. Others, who do not go so far, suggest that *each living unit* possesses somewhere in its subconsciousness — though that is not the way they put it — a design of what it ought to be, enabling it to effect repairs; a design of what it might better be, enabling it to change its structure a little to accommodate itself better to its surroundings; and a design

of what it might *still* better be, enabling it to move upward a little on the great evolutionary path.

The "chance" people are mechanicalists, thinking all the phenomena of life to be explicable in terms of mechanics, and all the variations which ultimately result in new species, to be chance. The Professor declared himself provisionally in the latter group.

Nevertheless, that each creature has a plan of what it ought to be, and according to which it grows, he showed by one or two striking examples. Here is one:

If the lens be removed from the eye of a young tadpole, the animal proceeds to manufacture a new one to take its place, and the eye becomes as perfect as before.

The extraordinary feature of the case is — that the new lens is not formed in the same way or from the same materials as the old one. In the normal development of the tadpole from the egg, as in all other vertebrate animals, the lens is formed from the outer skin or ectoderm of the head. In the replacement of the lens after removal it arises from the cells of the iris which form the edge of the optic cup, and this originates in the embryo not from the outer skin but as an outgrowth from the brain. As far as we can see, neither the animal itself nor any of its ancestors can have had experience of such a process.

Some consciousness, in or behind the animal, knows what is wanted there, feels it somehow. Ectoderm is no longer available. It therefore uses other cells, which have never before performed any such work, to do the necessary materialization of its ideal. If these cells were separate individuals leading separate lives in nature, we should have the phenomenon of spontaneous variation. In the case under consideration the usefulness of the variation is obvious. May not *all* spontaneous variations in nature of separate individuals be as useful to the great organism, nature, as this to the small organism of the tadpole?

Are these variations in all directions, by chance; or do they in a general way tend to point in the proper and useful and upward direction? "It is undoubtedly the fact," says the Professor,

that few working naturalists feel convinced that the problem of organic evolution has been fully solved. One of the questions upon which research is seriously engaged is whether variations or mutations are indeterminate, as Darwin on the whole believed, or whether they be in greater or less degree determinate, proceeding along definite lines as if impelled by a *vis a tergo*.

The latter theory

has found a considerable number of adherents among recent biological investigators, including some of our own colleagues, who have made important contributions to the investigations of this fundamental question.

The question is indeed fundamental: — whether cosmos be a mere mechanism wound up by the running down of a previous cosmos, and itself destined to run down; or a crazy dream of some "Great Foresightless"; or the physical garb and process of a Great Proposer, moving to a sublime goal. STUDENT

## Nature

## Studies

## Attributing Human Motives to Animals

NATURE is so large and various that she defies attempts to define her doings and her reasons by any circumscribed theory. We make the theory on the strength of some facts we have observed and then further facts are discovered which do not support the theory. Then we go to the other extreme and contradict the first theory, in which policy we may be equally at fault.

From a review of a recent book on birds, in the London *Spectator*, one learns that the author finds many reasons for dissenting from the too rigid application of the theory of *protective mimicry* which some followers of Darwin developed to a degree that would have surprised their master. Many facts prove that a good deal of the mimicry in Nature is protective; but on the other hand there are facts to prove that often it is the reverse of protective. The nests of the long-tailed tit and the chaffinch are covered with lichens and usually built against the lichened bough of a tree. But often they are built in green bushes where the same lichens only render them the more conspicuous. Another point is made in connexion with the theory that the gay plumage of male birds and their habit of displaying it is for the purpose of attracting the female. But the author says

I have seen a peachick not larger than a fowl throw itself into full show position when startled by a cat passing near it. So with the turkey, . . . any emotion, angry as well as amorous, will throw him into this position, and his ordinarily meek spouse will assume it when she is bent on aggression.

The song of birds has also been explained as "nothing but an expression of defiance flung in the faces of rival bachelors." But a lark has been observed to burst into song when hit by a stone. The song is an expression of strong emotion, generally of the jubilant kind;

but animals, like human being, sometimes get their feelings mixed.

The author suggests two theories: either the so-called *amorous display* was originally for the purpose alleged, and afterwards came to be used for other emotions; or else it is merely the bird's natural way of expressing emotion and is used whenever the bird feels emotion of any kind.

Certainly it seems unnecessary to infer that the birds are actuated by petty vanity, or unconsciously impelled by "Nature" to practise upon other similar weaknesses in their mates. It would be vain and unseemly in a human being to display himself in that way—say, rather, it *is* so, for does he not do it? But this only amounts to saying that it is un-

seemly for a man to behave like an animal, and it does not incriminate the animal. If a man falls on his food and devours it, we call him gluttonous, but it is not gluttonous in a dog to do so. Similarly what would be culpable vanity in a man may be an expression of sincere feeling in an animal and the best it knows how to do.

We may discern in Nature the outward signs of many elementary forces, which are exercised naturally and without self-consciousness. Exercised by man, these same displays would involve vanity, self-consciousness and hypocrisy, and hence become vices. But they are not vices in the animals. We should not impute to the animals our own failings of hypocrisy and amorous vanity; especially if we happen to be denying them their due degree of intelligence in other respects. STUDENT

## The Beach at Lomaland

THE Lomaland grounds are from 300 to 400 feet above ocean level, and a few minutes' walk down the hillside and on across the beautiful *mesa*, with its innumerable wild-flowers all sparkling in the sun, brings one to the brow

of the cliffs, and from there paths may at intervals be found leading to the beach. The cliffs vary from a soft sandstone containing great spherical ironstone concretions and myriads of little red-brown nodules of the size of a bullet to a gray marl. The strata are practically horizontal, as may be seen from the two sections at right angles to each other in the cut.

The beach is sandy, and boulder-strewn near the cliffs. In nooks among the water-hewn arches and colonnades may be found polished and rounded pebbles of many-hued porphyry which have arrived by age-long journeys from distant mountains, down the bed of now dried-up streams. The westerly aspect of the beach makes it warm and sheltered. STUDENT

## IMMORTALITY

Joseph Jefferson

**T**WO caterpillars crawling on a leaf,  
By some strange accident in contact came;  
Their conversation, passing all belief;  
Was that same argument, the very same,  
That has been "proed" and "conned" from man  
to man,

Yea, ever since this wondrous world began.

The ugly creatures,

Deaf and dumb and blind,

Devoid of features

That adorn mankind,

Were vain enough, in dull and wordy strife,

To speculate upon a future life.

The first was optimistic, full of hope;

The second, quite dyspeptic, seemed to mope.

Said No. 1, "I'm sure of our salvation."

Said No. 2, "I'm sure of our damnation;

Our ugly forms alone would seal our fates

And bar our entrance through the golden gates.

Suppose that death should take us unawares,

How could we climb the golden stairs?

If maidens shun us as they pass us by,

Would angels bid us welcome in the sky?

I wonder what great crimes we have committed,

That leave us so forlorn and so unpitied.

Perhaps we've been ungrateful, unforgiving;

'Tis plain to me that life's not worth the living."

"Come, come, cheer up," the jovial worm replied.

"Let's take a look upon the other side;

Suppose we cannot fly like moths or millers.

Are we to blame for being caterpillars?

Will that same God that doomed us crawl the earth,

A prey to every bird that's given birth,

Forgive our captor as he eats and sings,

And damn poor us because we have not wings?

If we can't skim the air like owl or bat,

A worm will turn 'for a' that."

They argued through the summer; autumn nigh,

The ugly things composed themselves to die;

And so to make their funeral quite complete,

Each wrapped himself in his little winding sheet.

The tangled web encompassed them full soon,

Each for his coffin made him a cocoon.

All through the winter's chilling blast they lay

Dead to the world, aye, dead as human clay.

Lo, spring comes forth with all her warmth and love;

She brings sweet justice from the realms above;

She breaks the chrysalis, she resurrects the dead;

Two butterflies ascend encircling her head,

And so this emblem shall forever be

A sign of immortality.--- From Kansas City Star

## The Oncoming Tide of Spiritual Life

**T**HEOSOPHY teaches that the spiritual life is not something apart from practical life; "in it we live and move and have our being," and in the deepest sense spiritual wisdom brings us a better knowledge of all things. It is wrong to separate spiritual from physical, mental, and moral life, because it acts through all these, and is the basis of consciousness.

That the tide of spirituality is rising in the world today, has been observed by those who closely watch the trend of events, and are able to interpret their meaning. The idea

of unity is inseparable from it, and we cannot doubt that this idea is growing in the consciousness of men and nations. A larger sympathy and kindness is beginning to be generally felt; also it must be said that this rising tide is sometimes used wrongly, and for selfish ends. Another sign of it is the growing power to discriminate between the true and false in religion.

In everything we find a true and a false, that which is genuine, and that which is mere sham. How shall we acquire the eye that perceives truth? The study of comparative religion shows that all the religions have certain fundamental ideas in common. These are universal truths, but round them have grown up many notions the reverse of spiritual— notions which have been substituted for the truth, and which obscure it. Hence creeds and dogmas, the prolific seeds of materialism; false religion, the greatest curse that a nation can suffer; whereas true religion is undoubtedly the greatest blessing, for in its light wrong cannot exist.

Theosophy is Divine Wisdom: it antedates all religions, and is the truth lying at the back of them and of life; not something to be taken on blind faith, but demonstrable fact. There may be many degrees of truth, but the truth itself is one, and of whatever race or color we may be, when we come to it we are in unity. This Divine Wisdom has always existed, for in it are the great principles upon which all things are built, from the life of a Universe or planet to that of an insect or flower. There is nothing narrow or personal in it; it is not the property of any one nation or individual, but is in and for all. Man is the microcosm of the macrocosm, or a little universe in the great universe, and so he has the power to be in touch with all life; when he expresses his own divinity he is in contact with the universal divine consciousness. We are not worms of the dust, nor the descendants of tailless monkeys, but divine beings incarnate in animal forms through which we have to learn to express our divinity.

But to accomplish this in one life on earth would be impossible, many lives are required. Every great Spiritual Teacher has taught this. Jesus taught it, and on more than one occasion had conversations with his disciples on Reincarnation. We are so psychologized and blinded that we do not see that this is so, yet what more direct and natural conversation on Reincarnation could there be than this—"Whom do men say that I am? Some say that you are Moses, or Elias, or one of the prophets?" Students of the subject are well aware that Reincarnation was the ordinary belief of the Jews at that time.

Evolution is only possible through Reincarnation. We have need to incarnate in the families or nations that have developed the qualities or characteristics necessary to be acquired by us in order that our lives may be rounded out and made perfect. So nature gives us the opportunity to do this, and so we evolve. True students of life evolve consciously and all the time.

There are laws which must be obeyed. Nature is perfectly frank, and will permit us growth and perfection only when we follow the way she shows, reserving failure for those who prefer ways of their own. All action must be on unselfish lines. H. P. Blav-

atsky and William Q. Judge insisted on this; so that many who came to them for occult teaching turned away, disappointed of attaining some, as they considered, deeper or more mystical thing. They were incapable of assimilating the first thing in mysticism, which is just this unselfishness of purpose.

These teachings of Theosophy are not given out to the world to be blindly believed, but to be acted upon and put into practice. It is absurd to talk about religion with corruption rife in our cities. If there were even a small number of people living according to the principles of religion in any city, that city would be clean. Theosophy is a living power of encouragement and purification, and wherever it goes there is bound to be a clearing up of old conditions, a straightening of the crooked paths.

That is why the members of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY endeavor to make it very clear that they are in no way connected with certain people who use the name of Theosophy for their own ideas. It is quite necessary that they should be so. If you were very anxious that the people should get good bread, and sawdust were being sold to them, or worse still sawdust with a little strychnine intermixed— what would be the right thing to do? What would be the brotherly thing?

There is a conflict going on in each man's heart and in the heart of the world between good and evil, the material and the spiritual; the spiritual is the strongest, but it must have a footing in our lives to make its power felt. Many Great Souls have helped on the spiritual side down through the ages; a little done now and a little done then till at last the benefit of their mighty work shall be felt throughout the world. It is a grand thing to think that every effort we make on the right side is helping to bring about enlightenment. For enlightenment will come, and the whole condition of mankind will be changed. This is not hypnotism. Theosophy does not endorse that. It is a murderous thing to take mental control of another's life. Self-evolution is the right way; mental domination and forcing from without are wrong. We have to learn to do the right thing ourselves. Yet if we have no surer guide than conventional morality we shall err a thousand times; we have to become acquainted with the laws of life.

There are two great armies at warfare continually; the one compassionate, wise, and noble; the other fiendish, merciless, crafty and cruel. We are with many friends from the first although we may not know it, and as we strive to purify and enrich our lives and to fashion them according to the ennobling teachings of Theosophy, we are helping on the rising tide of spiritual life. W.

EVER since we began to remember, we know that our personal identity has not failed us, no matter how bad may be our memory. This disposes of the argument that identity depends on recollection, for the reason that if it did depend alone on recollection we should each day have to begin over again, as we cannot remember the events of the past in detail, and some minds remember but little yet feel their personal identity. And as it is often seen that some who remember the least insist as strongly as the others on their personal identity, that persistence of feeling must come from the old and immortal soul.—William Q. Judge

## VIRTUE

Archibald Lampman

I DEEM that virtue but a thing of straw  
That is not self-subsistent, needs the press  
Of sharp-eyed custom, or the point of law  
To teach it honour, justice, gentleness.  
His soul is but a shadow who does well  
Through lure of gifts or terror of the rod,  
Some painted paradise or pictured hell,  
Not for the love but for the fear of God.  
Him only do I honour in whom right,  
Not the sour product of some grudging control,  
Flows from a Godlike habit, whose clear soul,  
Bathed in the noontide of an inward light,  
In its own strength and beauty is secure,  
Too proud to lie, too proud to be impure.

—Selected

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** What prevents people who are really seeking for light on perplexed questions from seeing the truth of Theosophy as evidently you see it?

**Answer** "Theosophy," said William Q. Judge, "is an extension of previous beliefs; no one was ever converted into Theosophy." A person may be honestly seeking for light in a thousand and one directions which will never bring him to it. The sun will not rise for you in the West, though you search for its rising there never so diligently.

Think of this kind of seeker: one brought up in an iron orthodoxy which he learns to loathe until the whole spiritual nature of the universe becomes a byword to him, and he can find no glimmer of possibility in anything but the revelations of science and materialism. He will pass by the road to Theosophy unconscious of the signpost and direction, so set is he on advancing into the heart of matter. The divinity within him has received no call, and cannot stir to guide him. He is in full flight from the nightmare he has left behind and believes in no directing power; is mistrustful of all except untried analytical reason. So he goes on, and it may not be until the whole cycle of materialism has been experienced that he shall turn groping after something else. By that time the mind will have received a certain training to deal in material things, a tendency to question and demand proof for everything; so that afterwards he shall come out on his quest for light, armed with such useless weapons (for this purpose) as chemical scales and crucibles, which were made for other uses than to find spiritual light. Now Theosophy offers nothing to be tested with these things, whereas there are many ephemeral systems that do.

But if he rely solely upon these things they will certainly delay our seeker from finding the light in Theosophy, his very training—one-sided as it is—will put off the end of his quest, because reason *undominated by the higher part of man* is a thing that runs hither and thither time and again over worn and wearisome paths which it has no capacity for leaving. However trained it may be, and perfect, it cannot bring a man into knowledge of truth; any more than a steam-engine made to run along rails can acquire the power of being a flying-machine. It is conceivable that man

might so change and evolve the principles of the locomotive as to make it fly, but that will be the interference of a higher power. So reason can be lifted by the Soul of man until it soars with him in the higher regions; but until the Soul steps in—

But suppose a man in coming out from orthodoxy were to have complete control of his feelings, laying down such lines for himself as these:

"The old teaching I have received is obviously wrong. It fits my own inward nature neither in size nor shape, and can make no honorable claim to meet the needs of humanity. It has proved no check to the money-getting spirit, and the vices are laughing at the efforts of religion, where there are such efforts, to stay them. My own salvation need not concern me, but some way must be found for helping mankind.

"I will not sit and spin theories, nor go to schoolmen for advice; I will not go to the laboratory nor to the dissecting-room, but to where I shall find living men. These I shall study, to find material for judging of the truth of things. You say truth lies in the direction of science? A kind of truth; yet it is apparent that all science will not suffice to teach me to understand human motives, or to turn them into new channels when the need is. There is the human heart, and I do not know how science will find instruments to test that.

"Here is a man (one of hundreds of thousands) who had grand possibilities, but whom now vice or drink is ruining. As he is type of a class so numerous as to involve and threaten the whole world, it will be well for me to find out if I can, what set him on his downward course, and what power or chance there is to stop him.

"We can lock him away, to a certain extent, from the things that are his curse—but what of his mind? What of his desires that we cannot reach?

"He was born of ordinary parents; it would be wise to begin at the beginning, and see what seed was in their lives, to have bloomed so foully in his. He was educated in the ordinary way; classics, mathematics and so forth; of course religion. Temptation came to him and he fell. Something was lacking, something was wrong, since he was not given any weapon, nor was able to acquire any for himself, wherewith to beat back temptation.

"What weapon is there but Will? And what should arouse will, but motive? And the man had no motive that was big enough to arouse his will.

"What motives was he taught to think fit to cherish? His mother taught him religion, to seek the way of salvation of his *own* soul; that doing evil would bring him eternal torment. That is, he must walk straight *for his own sake*. In school they taught him that he must work that he might advance and prosper in life. They strove to master his idleness and wrong tendencies by appeals to ambition (selfishness), or else fear, selfishness again. So he learned to have no objective but to serve self.

"Then came the evil thing and made the same appeal. 'I can make you happy, I can give you pleasure,' it said. 'But what of my prospects, and my soul's salvation?' he answered.

'I shall interfere with neither. You can repent, for heaven's sake, and as far as this world is concerned, no one will know; or, the thing will not go far enough to harm them.' 'Very well,' said the man—and the door was opened to the hell in which he suffers.

"So that religion and education appealed to the same center in him which after was to be appealed to by vice. Then the negativity and lack of ideals that marked his parents broke out into positive form in him. It allowed them to remain respectable citizens, but in him it was multiplied to this."

We need not pursue this man's inquiry, but can see that his cultivation of sympathy will have so cleaned his nature and kept it sweet that he will not fall into pessimism; while the need that presses him to find a remedy will not let him rest at "God's in his heaven, all's well with the world." So we may say that the man whose search for light is moved by the desire to help and serve his fellows will grasp eagerly at Karma and Reincarnation, because they do explain human conditions; will grasp eagerly at the teachings about the dual nature, and the Râja Yoga education, because they afford the lever he has been searching for; and because he wants theories to fit men, and not men to fit theories.

So here are two cases, and they could be multiplied indefinitely, of men who seek the light. The man whose search is with his whole nature and whose urge is altruistic—finds. The man who merely rebels and goes out seeking truth for his own sake—wanders. The first looks in the right place—man; the heart and life of man—his interest in man impels him to look there. The second looks elsewhere—theories, formulae, opinions, chemical paraphernalia. He looks at results instead of causes. His desire to acquire information brings him to these instructive and interesting things. The first grows more sanely human as he goes on, because his heart and goal are in humanity. The second is in danger of the atrophy of his human qualities, because his thoughts are always drifting into extra-human realms.

Then it must be said that along the path of search are all manner of lures and pitfalls, which may a long time delay the finding or quite end the quest. Reincarnation explains it all. There have been lives and lives behind us, in which these stumbling-blocks have been prepared by ourselves, or the path has been made clear for us by the service we ourselves have done. And because of the vast entanglement of causes we have sown long ago, some bright doing of his at some forgotten epoch may lead a man by swift roads to Theosophy, although selfishness is still clinging about him till his life is poisoned with it; and by the innate purging power of these teachings he may find opportunity for freeing and freeing himself from self-interest. Or again, it may often be that the altruistic reject it, who in the past have let the fields of thought lie fallow, or earned some Karma at some time which dulled their mental vision. K. M.

WE are too prone to measure all possible states of life and places for experience by our present earthly one and to imagine it to be reality. But the life of the soul is endless and not to be stopped for an instant.—William Q. Judge

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## The Brotherhood of Races

TO promote unity between races and to further the cause of human brotherhood without distinction of race or creed, is one of the objects of Theosophy.

It is admitted that taking things as they are, there are barriers between peoples, especially when of different stock. It is admitted that these barriers have often defied the efforts made to surmount them. It is admitted that many of the attempts so made are unwise and result in harm rather than good. But it cannot be admitted that such barriers, however insurmountable they may appear under present conditions, are always to be insurmountable. For may not the conditions that make them insurmountable change?

In such a question as that between the Caucasian and African races in this country, one finds it impossible to take sides, owing to the risk of seeming to identify oneself with the unwisdom frequently displayed on both sides. While on the one hand the unwisdom of attempting to force impossible conditions and of meddling with questions which our experience does not warrant us in undertaking is obvious; on the other hand it is impossible to agree with the assertion that race-barriers are something that has been placed there by the hand of a wise Providence.

Present facts have to be accepted and cannot be ignored without ill consequences; but we need not exalt them into eternal laws and discount the whole future of humanity.

What is the reason why divergent races, such as the Eastern and Western, have not been able to harmonize better? Is it not that they have been unable to find a common standing ground? In all the ordinary relations of life they have appeared to be so different from each other that there has been no single one of these relations that could constitute a basis of union. The divergence has seemed fundamental; but that may be only because neither race has sounded deep enough.

Let us compare the case of individuals of marked temperamental disparity. So long as each one accentuates his own personality and clings to his peculiar traits, the incompatibility is increased. Yet the exigencies of social life constrain us all to suppress our angularities and rise to a plane on which it is possible for all to meet harmoniously.

## MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

And have not races personalities that need conquering before concord can obtain? It is excellent to subordinate personal interests to patriotism, but is there not a larger patriotism—one that embraces all humanity? And are we not ready for this larger patriotism, now that the physical barriers between races have been so widely broken down?

Perhaps these national and racial qualities on which we so plume ourselves may not be such eternal laws of righteousness after all. And perhaps the other race's "defects" and "inveterate tendencies" may seem like cherished virtues to it. We get an idea of what disunited races look like from a higher point of view, from the comic cartoons. There we see a weird medley of symbolic figures playing rather ignoble parts—almost always quarreling. Fat John Bull and scraggy Uncle Sam, in the incongruous company of the Russian bear and the German Emperor *in propria persona*, struggle and wrangle like a lot of greedy children.

Let us by all means hold fast to our national virtues. But in that case there will be the less need to advertise them for fear people should forget that we have them. Is it any more admirable for one nation to say to another, "Look here! I'm so-and-so, and don't you forget it!" than for one individual to say it to another? If we have racial and national virtues descending to us from our celebrated ancestry, let us practise them, and then we may find other races more willing to accept them than they are on our mere assurance.

Theosophy offers a solution of inter-racial problems such as is not forthcoming from any other source at present before the world. This it does by pointing out the possibility of a common standing-ground. So long as races remain as they are, they may continue to be incompatible. But suppose each of them changes? Suppose the races can see their way to rise above the level of their individual idiosyncrasies that keep them apart and step

into a larger life where such friction will not exist?

Take the case of East and West. Here we find people saying that the races may live on the same soil but they can never mingle, and so on. Are not these people taking existing facts for eternal laws that can never be altered? Races can evolve and change, and can do this very un-

expectedly sometimes.

Granted that there is something in you that irritates me, and something in me that irritates you—need these conditions always prevail? Can we not, each of us, rise superior to those personal incompatibilities and sink them out of sight or altogether outgrow them? And why not so with races? Things are not by any means so fixed and immutable as we may be disposed to think.

Again, divergences are only the effect of time acting on what was originally one. There is community of origin among races, if we would but go deep enough. But as long as each race dwells in its superficialities, they will never touch this common depth. Theosophy leads all towards higher ground where the marked disparities will be left behind.

It is evident that this is the direction in which the march of events is forcing, leading us. Our scientific inventions and commercial interests have mingled races together so that they can no longer avoid each other. They will have to learn to get on together. But again it must be observed that this does not favor misguided efforts to promote artificial union. The growth will come naturally, as each progresses in the subjection of the common enemies, selfishness and ignorance. E.

## The Rāja Yoga School at Visingsö

THE difficulties as to when Mrs. Katherine Tingley would acquire a Swedish estate for her school, have been fully solved, and conveyance is now recorded of two estates in the center of Visingsö, with view southwards, and adjoining the Royal Forest. The place of the school is most beautifully situated, and it seems now to be only a matter of time before an institution will be established here after the example of the remarkable one at Point Loma, in California. The decision about time and ways is entirely in the hands of Katherine Tingley.—(Translation from *Göteborgs Handels- och Sjöfartstidning*, of recent date)

## Last Sunday Evening at Isis Theater

Mr. Cranstone Woodhead Speaks on "Theosophy's Message to Those Under the Shadow of the Law"

THE following extracts from the address delivered at Isis Theater, San Diego, last Sunday evening, by Mr. C. Woodhead, should interest all who believe that those in prison or who have come out of it are not intrinsically evil, but are, on the contrary, men who should have a fair chance again in life. The question is a deep one, but there can be no doubt that it admits of a proper solution; and that sound social policy demands a recognition of the fact that a man is always a man despite his mistakes, and that the surest way to reformation is by giving the unfortunate a kindly helping hand. OBSERVER

To those under the shadow of the Common Law the message of Theosophy is emphatically a message of hope and encouragement.

Theosophy teaches that which every thinking man must freely acknowledge *vis.*, that there is a supreme or Higher Law which is the guiding power of every other law, whether spiritual, mental, physical or material. The laws of all human action, of mind, of emotion, of health; together with the laws of mechanics, of physics, or of chemistry, or of any other science which men have discovered to be governed by law, are but different phases of the Higher Law acting through their appropriate instruments or *media*. It is no doubt true that man is, as yet, very imperfectly acquainted with the scope of the Higher Law, especially in regard to those questions which involve the issues of his daily life, thought, and actions; but still the Law is there, unswerving in its directive power.

We are so well acquainted with many of the known laws of the universe in the material world that we are apt to look upon them as commonplace.

Then comes a line beyond which the world has not yet advanced: men do not realize or admit that there are laws just as certain in their result which govern the human mind and the motives of the daily actions of every human being. It is not generally understood that the teaching of Jesus, "Whatsoever a man soweth, that shall he also reap," is absolutely true. And yet it only needs deep reflection to perceive the action of this law in every department of human life.

In order to realize this clearly, and more readily understand the underlying cause, we must study the teachings of Theosophy, which reveal the long-forgotten truth of man's divine nature. This divine nature, this inner witness and urge, which we call conscience, is the cause of the appearance and recognition in the world of all that is beautiful, good, and true. Were we all able to follow its dictates, the misery of human life would disappear as if by magic. Because we do not do so, there is trouble and unrest. The divine in man is always awaiting the opportunity of recognition. The opposite of this divine nature within us is that which causes disharmony and evil. It is the personal or lower nature. Thus human nature is dual in its action, and to this duality can be traced all the parables and symbolic stories, all the gods and devils, all the heavens and hells which have filled the literature of the world for countless ages.

Rightly understood, these fables point to the constant struggle between the forces of good and of

evil which is the law of the universe of which we, each of us, form a part. Once we know this and see it for ourselves we have a clue to many mysterious problems. Once we perceive that the world in which we live is a battle-ground of contending forces of good and evil, which we recognize by their appearance and semblance within ourselves, then we can look with a clearer judgment upon what is taking place around us.

What brings about the reign of justice if it be not the Higher Law which governs the universe? Without it the world would be a chaos, our very existence would be impossible.

And this brings us to the consideration of the Common Law, of the various nations of the earth as variously portrayed by the laws on their statute books, and by the customs which long acceptance has made legally binding. In whatever country we study these laws and legalized customs we find them to be an expression of the progress in evolution of that particular nation. In all cases they have come down from earlier times and their origin is apparently lost, but it is evident that they can be nothing else but the present manifestation of the history which has preceded them—the accumulated experience of previous generations. Their object is to safeguard justice, to promote order and the public well-being, to protect the property and rights of individuals.

And so those that are under the Shadow of the Common Law are suffering that they may become wiser, if they are willing so to regard the lesson which is being taught them. It does not by any means follow that a man who is in prison is intrinsically worse than many or even most of those who are outside it. He may be a great deal better man than thousands who have never passed through the experience of imprisonment. This is more especially the case if the time gained for reflection and re-adjustment has availed to make him see his error, and has so altered his character as to place him on a higher level of understanding, ending in a firm resolve to change his mode of life. If the apparent calamity is faced with resignation and manly determination, it may be thus transformed into a blessing. This acceptance of the result of the action of the Common Law places the prisoner above and outside of those who have not had this experience, but have deserved it as much or even more than he. The prisoner has paid his penalty and is free. The lawbreaker who is apparently undisturbed in a course of ill-doing may be puffed up with the assurance that he is evading the Law of Eternal Justice, but let him not be deceived. An old adage says: "The mills of God grind slowly but they grind exceeding small." No man of discernment would not rather a thousand times be he who has paid his penalty and learned his lesson, than he who is pursuing a course of wrong-doing in the delusion that he will not suffer for it. Sooner or later the Eternal will be vindicated, and its existence will be made plain, not with the idea of the unhappiness of the wrongdoer, but that he may be enlightened and re-established upon a plane of progress and right action.

And this brings us to the message of Theosophy to those under the shadow of the Law. We have already said that this message is one of encouragement and hope. The ancient Wisdom-Religion, Theosophy, depends for recognition upon its foundation of truth in the hearts of men. The universal Divinity expresses itself through that brotherly feeling and desire for the common well-being which

underlies the highest ideals of human happiness. The great heart of H. P. Blavatsky was touched with compassion when she passed through every kind of misrepresentation and persecution in her efforts to organize a firm basis of brotherly and intelligent helpfulness for the benefit and encouragement of those in sorrow and in darkness.

The UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY at Point Loma, which is the outcome of her life-work, is now under the direction of a worthy successor, Katherine Tingley, who established, several years ago, the International Brotherhood League as a branch of the Theosophical Movement.

It would be beyond the scope of the present paper to relate all that this League has done or proposes to do for discouraged humanity, but two of its Objects may be here stated:

To assist those who are or have been in prisons to establish themselves in honorable positions in life.

To ameliorate the condition of unfortunate women and to assist them to a higher life.

In carrying out these objects the Theosophist is working with the Higher Law. He takes men and women for what they are and not as their misfortunes have labeled them. The idea of the Theosophist is that a prison should not be so much a place of punishment as a place for reform and instruction. Many who are in prison are there through ignorance. And once the reform is completed or the penalty is paid, common justice and sound policy require that a man be established in the world on a fair basis with those who are no better (most of them) than himself. Let us do away with the hypocrisy which separates the discovered misdoer from the undiscovered one. There is neither justice nor mercy in it, and Justice and Mercy are the foundation pillars of the Temple of Humanity.

How many there are who exclaim when they have realized their mistakes: "Oh if I had another chance!" The message of Theosophy to all men is that there is *always* another chance.

Even for those in prison whose return to the outer life of the world may never come about, there is still another opportunity. For Theosophy teaches that when a human soul has passed away from the world of strife and endeavor, it passes into a place of purification and rest from whence it returns once more to earth-life in the body of a little child, to resume the path of progress at the point at which it was relinquished in a previous life, and so on and on through the countless ages of the future until the great goal of Divinity is attained.

There is always another chance. The future is built upon the present. The man who has attained some measure of enlightenment and self-conquest through the experiences of life will never have quite the same work to do again. The Divine Law has accomplished its end and its action is just and true.

PUBLIC Theosophical meetings are conducted every Sunday night in San Diego at 8.15, at the Isis Theater, by the students of Lomaland, assisted by the children of the Râja Yoga School. Theosophical subjects pertaining to all departments of thought and bearing on all conditions of life are attractively and thoughtfully presented. An interesting feature is the excellent music rendered by some of the students of the Isis Conservatory of Music of Lomaland. Theosophical literature may always be purchased at these meetings.

### Palindromes

OF literary curiosities, the palindrome has been regarded as the extreme example of useless ingenuity. The manufacture of such sotadic verse seems to have been especially suitable to the monkish system of pseudo-culture and there is one which is supposed to have occupied a monk the greater part of a life-time to perfect, short as it is:

Sator arepo teret opera rotas.

Although this Latin sentence answers the conditions of a palindrome (Gr. *palin*, again *dromos*, a course) in that it runs its course backward and forward alike, it possesses the extra merit that each initial forms the first word, the second letters form the second word, and so throughout the verse. It is possible to make a translation, but without interest.

More dignified than the English pun with which the "first man" is said to have introduced himself to his bride, "Madam, I'm Adam," is the couplet:

Sigma te signa; temere me tangis et angis:  
Roma tibi subito motibus ibit amor.

This was deemed so clever in ecclesiastical circles that the *deus ex machina* of the church of the middle ages was introduced to account for its invention. A story of varying detail, requisite to fit the necessities of the case, runs that a monkish pilgrim to Rome discovered the devil under the guise of his traveling companion and by enchantment of some sort compelled his comrade to carry him. Crossing himself and generally making his extempore steed unhappy with cruel treatment, the later protests in the words of the verses given, which the ingenious can make applicable to the circumstances without much straining after a meaning.

Of no value in themselves, these formulae bear witness to a phase of thought which is still in its infancy, after having passed through the usual stages of ignorance, ridicule, bitter opposition, previous to the metamorphosis of orthodox acceptance in the secret and subsequent public appearance as "science" after its naturalization papers have been discreetly pigeonholed. This is the recognition of the fact that we are only just emerging from a period of darkness and ignorance and that the "ancients" and "antiquity" were not at all necessarily less informed or less civilized than ourselves, but in many ways far ahead of us. Instead of "primitive man" and the "stone-age" evolving noble myths by mere guesswork and superstitious imaginings, we find that (on the introduction of H. P. Blavatsky) the unexplainable customs and traditions and lore of barbaric races is but the merest remnant of knowledge once possessed by the high civilizations of which they are mostly degenerate descendants on their way to extinction. We are slowly preparing to learn that which the East has known from time immemorial—the existence of sciences and stores of even material knowledge whose very existence is not only unknown but unsuspected in the West.

One branch of a very real science is the power of the spoken word and its rhythms, and it is in just such formulae that the traditions of all races retain a memory of the deeds done in the days of the greatest glory of their antiquity, from the "open sesame" of Arabic lore and the "Let there be Light!" of

the Hebrew demiurge, to the *abracadabra* of dabblers in magic of all ages.

A conglomerate of the religions of antiquity, and intermixed with the concessions demanded by concurrent retention of the temporal power, the Christian religion in its hundreds of various shades of belief and ceremony contains many an unexplained fossil relic of once living realities, not the least interesting of which is this science of verbal formulae—even now referred to in the least understood of the books appointed to be read in churches—"In the Beginning was the Word."

No wonder that when in the fourth and fifth centuries the church grafted itself on to the temporal power with the ultimate view of controlling both, it was necessary to inaugurate that system of high exclusiveness which had been previously utilized by the Jewish hierarchy for a somewhat similar purpose—to conceal from the crowd a knowledge of what in the "vulgar tongue" would prove very dangerous.

Thirty years ago Madame Blavatsky made references to secret works within the walls of Rome itself, but not on library shelves, which would probably throw much light on many a ceremony, many an unexplained custom, and many a literary pastime which passes for a mere curiosity. The *Sortes Virgilianae*, the Virgilian lots, and the not uncommon substitution of the pages of the Bible among Christians for the Roman poet's verses; the use of phylacteries and similar practices; the interminable repetition of religious formulae; the use of the very ancient monogram of the Greek mysteries "I. H. S.", and many a parallel of the Buddhist praying wheel, the mantram, and even the Chinese doctor's pill made up of a written prescription macerated in water, are all of a class to the extent that they are, as publicly exercised, distorted echoes of anciently known sciences of which those once forbidden to read the scriptures in the "vulgar tongue" will demand to know more ere long.

### Flies---Physical and Otherwise

THE house-fly is coming in for a good deal of abuse just now, but it is by no means impossible that someone will discover that he is one of our best friends. That, however, is in the future. He steps in all kinds of decayed and infected matter and does not trouble to wipe his feet before stepping on our food. Hence he plays the part of a mixer-up of the things we throw away and the things we eat. Details of his achievements in this respect can be found in plenty, but they would not be suitable here. One may easily imagine, too, the various plans of precaution that have been suggested. They consist mainly in screening the garbage, killing the flies, using kerosene and lime to kill the larvae, and keeping flies out of sick rooms.

It is worth remarking, however, that there is a tendency to attach to minor causes too much blame for ailments that are mainly due to greater causes. Robust health resists all these causes of infection, being naturally endowed with the means of neutralizing them; but impaired health succumbs to slight attacks.

Another point is that one could wish the ratio between physical sanitation and moral sanitation were better observed. When one considers the moral and mental conditions

that prevail in great cities, one's interest in such questions as the fly nuisance is apt to pale. *What have we the right to expect at the hands of Nature?* The conditions from which we suffer are those which we create by our manner of life. Material science is trying to push too far ahead of moral science, and that is why it can only meet with partial success. The ratio needs to be observed.

All this might seem mere high talk if one did not know that there is no such thing as *separation between our physical life and our inner life*. From our minds we throw off effluvia which pass out into the world, there to pollute the sources of life—life animal, vegetable, and mineral; and what can science tell us about these *sources* of life? It can tell us that the larvae of the fly breeds in filth, but whence the *life-monad which ensouls the fly*? What becomes of evil thoughts, and whence do noxious creatures proceed?—two questions which might solve each other.

The law of conservation of energy should be extended so as to include thought-energy and emotional energy and to account for the vital energy of insects; then the unity of life might be better understood.

Physical means of sanitation are important, but they need to be backed up by moral means; otherwise we are fighting conditions which we continually reproduce. As long as there is such a state of moral impurity, an epidemic, regrettable as it is, may be even necessary as a safety-valve; and by its devastating action may prevent worse dangers on the moral plane.

STUDENT

OFTEN when by an intellectual energy I am roused from body, and converted to myself, and being separated from externals, retire into the depths of my essence, I then perceive an admirable beauty, and am then vehemently confident that I am of a more excellent condition than that of a life merely animal and terrene. For then especially I energize according to the best life, and become the same with a nature truly divine: being established in this nature, I arrive at that transcendent energy by which I am elevated beyond every other intelligible, and fix myself in this sublime eminence, as in a divinely ineffable harbor of repose. But after this blessed abiding in a divine nature, falling from intellect into the discursive energy of reason, I am led to doubt how formerly and at present my soul became intimately connected with a corporeal nature; since in this deific state she appears such as she is in herself, although invested with the dark and ever-flowing nature of body. . . . But in the *Timaeus* [Plato] discoursing concerning the universe, he both praises the world and calls it a blessed god, and asserts that soul was given to the universe by its beneficent artificer, that it might possess an intellectual condition; since it is requisite that the world should be intellectual, which cannot take place without the intervention of soul. Hence soul was infused into the universe by the demiurgus on this account, and each of our souls was in a similar manner inserted into body, as necessary to the perfection of the whole. For it is requisite that as many and similar genera of animals should be contained in the sensible, as abide in the intelligible world.—Plotinus *On the Descent of the Soul*. Translated from the Greek by Thomas Taylor.

## The New Japanese Ambassador at Washington

WITH the arrival of Baron Takahira on our shores for the second time as the representative of the Emperor of Japan, a new era seems to have opened in the relationship between that country and the United States. The ambassador is a man of the widest culture and most sympathetic nature, whose education and breadth of view is equal to, if not greater than, that of most statesmen of the self-styled "civilized" nations — nations which are afraid to lift a finger towards the settling of certain crying evils for fear of the frightful specter of a probable Armageddon which overshadows the European chancelleries.

The Baroness Takahira is also a leader in the van of progress, being one of the earliest women graduates of the European schools in Japan.

Mr. Takahira, as he was then, made a most favorable impression on the United States Government during the anxious period that elapsed just before the breaking out of the Russo-Japanese war. Although he is a master in the extreme caution which is a mark of Japanese diplomacy it was proved by the testimony of a high United States Government official that the efficient protection of the interests of one's own country is perfectly compatible with honorable conduct. He said:—"The Japanese minister has been absolutely truthful and straightforward in all this controversy."

In a speech made by Baron Takahira when last in the United States he pointed out with great earnestness and logic that the interests of America and his own country were closely related, and that any want of harmony between the nations would be a misfortune for the world; and he has proved his practical interest in keeping peace by his strenuous efforts during the successful treaty negotiations at Portsmouth which terminated the Russo-Japanese war—the bloodiest, all things considered, in the history of mankind. He is a great admirer of President Roosevelt, and his appreciation of the President's splendid humanitarian work in initiating and carrying through the negotiations is shown in the following quotation from the speech with which he closed his first period of service in America in 1905:

I am convinced that I am only echoing the true sentiment of the whole civilized world when I say that humanity and civilization owes him [the President] a great debt. I assure you that President Roosevelt will be immortalized forever in the hearts of my countrymen as well as by the people of that part of the Far East where our influence extends, and all American citizens will always receive there a cordial welcome.

That these words were truly prophetic was

proved during the recent visit of Secretary Taft, who was received with the greatest cordiality in spite of the efforts of a few yellow journalists in both countries to stir up unpleasant feeling over unimportant questions.

It was the United States, represented by Commodore Perry's expedition in the middle of the last century, that afforded Japan the first opportunity of adopting the best things in Western civilization and of entering the comity of nations; and the two great branches of the English-speaking peoples have ever since watched the progress of Japan with brotherliness and sympathy. Unfortunately, the brotherhood of nations into which Japan has stepped is still anything but an ideal one although, owing to the efforts of the humanitarians in many countries in the establishment of

and exerted an admirable influence in teaching self-control and self-discipline. Bushido is not a religion, but an unwritten law of conduct. It is the Rāja Yoga of Japan. Buddhism has still a considerable hold on the people, and the Shinto religion has not lost its power, but, unfortunately, in the endeavor to keep pace with the Western nations, a certain proportion of the educated classes, dazzled by the physical discoveries of Europe and America and the intellectual subtlety of modern scientific agnosticism, think it quite the thing to affect to despise and repudiate their ancestral beliefs. The dogmatic teachings of orthodox Christianity, with the "Eternal Hell" and "Vicarious Atonement" theories, have found little favor with the reasoning minds of Japan, and if any considerable number of them ever

adopt any form of Christianity it will have to be one more in accordance with the teachings of the Founder; for the pure teachings of Jesus, in their enunciation of the principle of Compassion as the rule of life, and the necessity of destroying the sense of separateness and personal selfishness, are in harmony with the "Noble Eight-fold Path" of Buddhism, the Shinto ideal, and the teachings of all the great World-Saviors and Teachers.

Through the portal of Theosophy there is no difficulty in entering into that attitude of mind which sees one Eternal Truth existing in the various forms in every creed. But, as Katherine Tingley has said, "Japan does not lack guidance

in noble living; *the spirit of the past is not dead*. It is a fundamental Theosophical teaching that man cannot reach higher kingdoms without help from those who have attained them, and there are Teachers in the East, in Japan, who are qualified to revive all that was best in Bushido, who can show that Buddhism, *freed from the superstitions that have grown around it*, teaches a noble and elevating code of life, and who can explain the full meaning of the striking symbol found in the innermost shrine of the Shinto temple, the *Mirror*, by which self-knowledge is typified." But there is a further promise still in the increasing demand for the knowledge of Rāja Yoga, which is coming from Japan—Rāja Yoga, that system of education which contains all the nobility and wisdom of Bushido and more; and as the cultured and patriotic Japanese find that materialism is fast losing its grip on the Western philosophic mind they are bound to look for the answer to their problems in the only place where it can be found—Theosophy, the ancient Wisdom-Religion, itself the "Warrior's Way" (*Bu-shi-do*), the "Path of the Gods" (*Shin-to*). Theosophy works for the binding of nations in a Universal Brotherhood superior to racial barriers. STUDENT

SHRINE AT NIKKO, JAPAN

**T**HOSE who ask for particularity of advice are not yet grown to the stature of a hero who, being all, dareth all; who, having fought many a fight in other lives, rejoices in his strength and fears neither life nor death, neither sorrow nor abuse, and wishes no ease for himself while others suffer.

— William Q. Judge

arbitration and peace congresses, the *entente cordiale*, etc., a beginning has been made towards the realization that the only use of separate national units is for the better development of individual qualities in a united family of nations, each being destined to work with the others for the real civilization of the future. Not, though, until each single man in each nation has really commenced to attack the ingrained selfishness in himself, and so to understand himself and the unity at the base of all apparent separateness, can the nations, as units, understand their wonderful opportunities and feel the true urge to unite in a common cause.

The ethical teaching of Bushido, which was the strongest incentive to right living in old Japan (although it was said to be binding only on the Samurai or knightly rank, numbering two millions), permeated the whole of society

O maker of the material world, thou Holy One! Who is he who brought the law of Mazda into the Vara which Yima made? Ahura Mazda answered: "It was the bird Karshiya. O holy Zarathushtra!"—The Mazdean *Vendidad*

### Theosophy in the Home

THE home should be the most helpful and attractive spot in the world, for if rightly organized the heart finds its dwelling-place there. What gives larger opportunities for both parents and children to minister to each other than the home environment? No one can live independently; the very needs of the family call for acts of co-operation; what one cannot do another can and should — nay, *must* — and so the spirit of helpfulness is brought out.

The home is necessary for soul-development on all planes. It brings into action the finer qualities of character, patience, charity, contentment, self-sacrifice, kindness, courtesy, and sincerity; and one who goes out into the world to fight his own battles after the training received in a good home feels the courage to encounter evil and conquer it.

But we know that there are many kinds of homes, for all are dependent upon the character of their inmates. The moment we enter one we find the atmosphere repellent, of another attractive, the direct outcome of the influence of father and mother. Their strength or weakness, their harmony or the opposite, is clearly shown in the children whose plastic minds are easily molded for good or evil. So many of us forget that childhood, even infancy, is the time for seed-planting.

Many mothers are weak, especially in the matter of wholesome discipline. They surround their children with love and tender care but fail to realize that they need a wise guiding hand, helpful *in the right way*. It is just here that a knowledge of Theosophy brings relief to the tried and weary mother, for it opens her mind to all that is good in life. She feels that "Life is Joy"; there is a song in her heart which every child senses. As she begins to realize her own divinity she will feel more keenly the responsibility she has assumed, the necessity for self-control and for daily communion with her Higher Self that the little

### LIGHT BEARERS

ANNIE WINGOR ALLEN

**B**RINGERS of hope to men,  
Bearers of light,  
Eager and radiant,  
Glad in the night,  
'Tis from these souls aglow  
Man learns his path to know.  
They as they onward go  
Bear on the light.

What though they fight to lose,  
Facing the night!  
Morning will find them still  
Seeking the light.  
What though this stress and strain  
Makes all their hopes seem vain!  
They through the bitter pain  
Bear on the light.

Brothers of all that live,  
They aid us all;  
May our hearts, touched with fire,  
Leap to their call,  
Their voices, clear and strong,  
Ring like a rallying song,  
"Upward against the wrong!  
Bear on the light!"—*Selected*

souls entrusted to her care may receive care in its fullest, its higher, meaning. There is a science of motherhood but it is only given to those strong souls who are willing and eager to yield the impermanent things for the permanent, who can discriminate between the higher and the lower elements in life.

The child, so recently from higher spheres, drinks in unconsciously whatever influence the mother's heart radiates. As the mother finds strength and wisdom from a practical knowledge of the Râja Yoga system of education and living in harmony with the great truths of Theosophy, so will she instruct her family and help them to become true workers for the regeneration of mankind, thus making the home the grand institution it was intended to become.

SARAH E. WILDER, M. D.

### A Birds' Paradise

**A** BOSTONIAN, Miss Annie J. Chase, who has devoted her life to the study of birds and plants, has a plan for a "Birds' Paradise" which, if carried out, will be to the birds of the Atlantic coast what Lomaland is to the birds of Southern California. Her plan, however, calls for a government appropriation and so must wait the course of all such plans and how soon it will be carried out is a matter for conjecture. Miss Chase has selected a certain hill near her home which, if it comes to be reserved by the government as a place where our beautiful native birds could be protected and will come to feel that they are so, will be a permanent influence for good.

But the Foundress of Lomaland long since adopted a better plan, which was to decide upon her own property (the very large tract on Loma Hill which the birds probably *don't* know as the Theosophical headquarters) as a place where wild birds should be protected from the very moment humans came there to live. For seven years not a shot has been fired on Lomaland soil at the pretty shy songsters, game birds and waterfowl with which the hill and beaches abound, not a single nest has ever been disturbed by human hand, not an egg or a fledgling ever stolen, not a single bird trapped or snared — even scarecrows are seldom put up to surprise them into sedateness! The old fear of man has been dying out in their little hearts all these years and today an outsider would find it difficult to believe the most meager account of the *entente cordiale* now existing between Lomaland birds and their human brothers. At this very moment a little towhee mother has just hopped down from the table on which these lines are being written, at a call from her voracious fledgling which she only yesterday proudly "brought home" to show to us. She is but one of several species (among them the white-crowned and gold-crowned sparrows, the

pretty little house-finches which we call our linnets, a single member of a shy and rather unsocial bird-group, the road-runner, and a pair of California Thrashers) which have quite appropriated human family and tent-home, inside and outside and all. No less than three linnet families are just now raising their broods where a human hand could disturb with the greatest ease, and twenty feet away, at the side of the path, is the favorite haunt of a pair of quail—shyest of all—which flush from almost under your feet as you pass the bushes. About the children's homes—where hundreds of boys live, too, and all know the average boy's *penchant* for stealing bird's eggs—the birds nest in the most astonishing places because they feel so perfectly secure, and every year witnesses additions to the number of species now here.

The birds are welcome in Lomaland and are made to feel so. Not a few Lomaland homes keep outside, in the friendly shadow of some shrub, a generous bowl of water, and the daily throwing out of crumbs is with many students a duty. The birds fully understand and repay one a thousand times. There is no prettier sight in the world than to see a half dozen of them "line up" by the bowl for a bath, or to see a mother-bird, a frequent sight just now, teaching her youngsters, one at a time, if you please, how to drink. And if there is any gratitude like that shown in the proud and confident look of some little towhee or linnet on the first day when she can show you her brood, all feathered and nearly ready for life's duties, it is seldom given to humans to receive it.

To watch these bird mothers argue with their little ones (who are at first very much alarmed when you approach them) and bring them to your door again and again, day after day, until they finally are perfectly tame—to see the faithful little mother and father birds literally wear themselves out in the effort to feed their big babies—as big as their parents for some days before they cease following the latter about, with open mouths and quivering wings, crying for food—to see the compassion, the absolute self-forgetfulness, the devotion to their duties, (instead of to other people's), the golden joy in life of these little birds, is an initiation into some of life's holiest mysteries.

And how they reward you! Is it no reward to see the flash and sheen of perhaps a dozen humming-birds in the course of a two-minute walk, the golden plumage of the oriole, more brilliant than any flower, the lightsome song of our little "wild canary" or California Gold-finch as a company of him fly up from the swaying stems of thistles or other seed-bearing plants where they love to feed? Is it no reward to see quail walk off almost leisurely at your approach—often no scurrying nor whirring of wings—to hear the golden notes of the meadow lark at every outing by day and sometimes a mocking-bird singing to his mate all night long? Is it no reward to have almost within arm's reach the little *ménage* of a pair of horned larks, she so patient in her brooding, he so joyous in his wealth of song, as if all the earth were wrapped in one golden sheen and he must

tell you about it? And then to witness their first singing lesson to their babies! How the fledglings gaze up at their father as he soars high and high and yet higher, a perfect burst of melody tinkling and showering down upon them. And then, one by one, they try to soar and sing—a funny little chirp at first and a funny little attempt at flight. But how can they less than try again and again and again—lesson here, too, for stiff-necked humans. Is it no reward to have the swallows build their mud nests near your very rooms, and to mind your going and coming no more than if you

Lomaland Photo. and Engraving Dept.

SAN GIOVANNI DEGLI EREMITI: PALERMO

were birds too? How beautiful they are, patrician from the end of the handsome bill to the tip of the long forked tail. How carefully they lift up their long graceful wings, lest they be soiled, when they alight at the edge of a pool to gather mud for nest-building. They look like giant butterflies, their wings all a-flutter. And then a little later to see a happy pair clinging to the nest's mouth (out of which, if one has sharp eyes, one may sometimes see stretched appealingly a tiny head or two) talking and cooing together as they feed their tiny tots.

Is it no reward to hear the last thing at night the bell-like melody of a mocking-bird with now and again a soft gentle owl's note, and the first thing in the morning, long before sunrise, the faint tentative tuning-up of a bird's orchestra, then a burst of melody as elaborately orchestrated as ever was symphony

by human hand, note set against note, notes tossed back and forth, calling notes, answering notes, a perfect myriad of notes like silver bells and golden bells and crystal bells, and all love notes, every one. Almost suddenly the first joyous *Allegro* comes to a close, there is a quieting. Some of the tiny songsters have flown to their day's duties; yet the symphony is continued—*Adagietto, piano*, then *pianissimo*, by the rest. These cease twittering one by one, and in no long time all the tiny orchestra members are busied at their brooding, or housekeeping, or food-hunting, and save for the occasional bird sounds of full day it is quiet again.

Is all this meaningless? How compares such a bird collection as that of Lomaland with the poor, stuffed, dead ones of our Natural History Museums? Not scientific? Nonsense. A pair of common opera glasses has more scientific possibilities hidden in it than gun, or snare, or scalpel ever had, if by science we mean knowledge and not pedantry. And what a common sense way of doing—not to wait for governments to do it for you, but just to take your own property and do it for yourself. Whether you own miles of wooded hills, an ordinary farm, a city lot, or perhaps only the lease of a tiny yard for a year or less, you can do something to protect the birds and make them feel that they are welcome. And if this should become the fashion (as much the fashion as it is in Europe to reserve tracts of land for shooting, and which ought to be named the Bird's Infernos) what a land America would be after a time. How much more of love and tenderness life would hold if even *one* farm or *one* estate in a community were known as a place where guns were *tabu* and where stealing of eggs and fledglings was never allowed; even *one* farm or tract where the holiday tramp through the woods could be counted a success without the evening pouch of poor dead birds, without the honey which some little nature colony had counted on to keep it from starving, or the nuts that some squirrel family had so patiently gathered against the cold of the coming winter, without the dozen lifeless butterflies in the "cyanide bottle," that insect morgue—in short, without any of those things which spoil our earth for living in.

And this could all happen so easily. It must be that people just haven't thought of it. "Birds," wrote H. P. Blavatsky, "are the symbols and glyphs of the higher divinities or angels." Perhaps there is a deeper aspect to this question than our bird-lovers, who have already done so much for bird-life, have ever dreamed. Perhaps if we would do our part toward making earth a "Bird's Paradise" the way would be opened for the birds to do *their* part toward making it a Paradise for all that lives. Who knows? Stranger things than this have been known to happen in the divine economy. STUDENT

... TELL me whether I am too sanguine when I say that if the Theosophical Society survives and lives true to its mission, to its original impulses, through the next hundred years—tell me, I say, if I go too far in asserting that earth will be a heaven in the twenty-first century in comparison with what it is now!—H. P. Blavatsky

# OUR YOUNG FOLK

## The Study of History

OUR subject is a familiar one. It is interesting and instructive if studied understandingly, but we are sorry to say men rarely have profited by the lessons of history. The selfish man will be selfish in spite of the fact that it leads him to destruction.

As a general thing we do not go beyond the mere facts and study the causes that led up to an event. Not merely the causes stated by historians but the causes of even these causes one might say. For a historian will only tell you, to take an instance, that the American colonies revolted because the English Parliament taxed them without their consent, quartered its troops in their cities, passed offensive laws, etc., etc.; but this is not all—other nations have been more oppressed, have suffered cruelly without revolting. We find the real cause in the spirit of the people. There would have been no revolution unless our ancestors had had a spirit of independence, had been confident that right is might.

Thus the true meaning of history can be found only in the study of the very life of the people, their laws, customs, and religion. Study them impartially, for we are too prone to find fault because they are dissimilar from ours. Rome fell, but why? Because the barbarians came and beat the Romans? No! because they were no longer Romans. They had not made Rome great and they could not keep her so; they had degenerated. And so with every rise and fall of nations.

There is another standpoint from which we may look at history, which is most vital. That nations and civilizations rise and perish we must believe to be a law of the universe. We must believe in a guiding law, in the divinity of man.

The rise and fall of civilizations is in the plan of our evolution. And here we must bring the teachings of Theosophy to bear upon the subject. It is the only philosophy which can explain these things. Theosophy teaches that man has been upon the earth many millions of years, but that he was not always as he is now. Also that life on this planet goes through seven rounds, each round being made up of seven root-races, each race subdividing itself, and so on. We are now in the fourth round and in the fifth race. The third race of this round inhabited Lemuria, the fourth, Atlantis, continents both now submerged.

Our race is destined to surpass previous ones, but we have as yet only been passing through a dark cycle. Our history for the last two thousand years has been a struggle with the lower forces in man. These cycles are periodic, inevitable, necessary. Unless we understand the laws guiding mankind, we cannot understand its history.

It is time that the historian did away with his stinginess and shortsightedness. His time tables are absurdly small. Our geologists are not afraid to declare the earth to be from one hundred and fifty to three hundred million years old, and archaeologists are chafing under the restraint imposed by the historian. The Adam and Eve allegory, not being able to expand like an elastic, must be snapped. How are we to know of man's beginning if for centuries we have been in a most pitiful state of darkness? We will not believe the ancients, but we shall soon have to. And then for all we know Rameses will laugh up his sleeve. We poor deluded moderns have much to learn yet, and bitter, but wholesome, will be our medicine.

Our boasted scientific attainments are but a few of the keys to the little drawers of nature. The mighty things are yet locked up and will never be given out until man has greater knowledge and is fit to use them. For has even the little we have

achieved helped the mass of humanity in the least? Have not most of our great inventions been used selfishly? Can we say that our moral condition is higher than two thousand years ago? Hardly. Thus we are still adding dark pages to history, and some of them even humorous!

Now if we look at the history of the last few thousand years as but a dark cycle in our evolution it will give us a new basis from which to study that history. We have to acknowledge that we have been wrong. Proofs of great civilizations in the far past are met with everywhere. We have to account for them somehow. And the further back we go the more are we struck with wonder. The more we plunge into the misty past the more confused do we become unless we accept the teachings of Theosophy. It is too much even for the fanciful mind of the poet and novelist. The trouble is that we have become in this last phase of our dark cycle almost rank materialists. Before we believed too much; now we do not believe in anything.

Theosophy is our only hope. Its teachings concerning man's history will be vindicated. The jungles of America and the sands of Asia have already begun to show the proofs. As to America, Mrs. Tingley has declared that it is older than Egypt. Also that Egypt is older than India. Astounding isn't it? But this twentieth century is declared to have many great revelations in store for humanity.

Now let us briefly review some of the history of the last two thousand years. Of course we shall first speak of Greece, the Morning Star that greets our delighted eyes, the most beautiful expression of the human soul. When shall we see another such race? The perfect balance in man on the physical, mental, and spiritual planes is here most beautifully expressed. And notice that we speak of the spiritual life of Greece. We must overcome the tendency to cast a little reflection on it. Because historians do not fully understand it, they are led to misconceptions, and even to view the Greek religious rites in a wrong light. Of course in time the Greeks did become blind to their heart life as is shown by their treatment of Socrates who came to lead them back to the right path. Soon superstition and immorality began to have full play. It was then time to save the good and spread it. We are tempted to enlarge upon the story of Greece and her glorious men—artists, poets, dramatists, and philosophers, but it is not within the scope of our present article.

Therefore we must next turn to Rome, once mistress of the world, but the slave of her passions. But it was not so under the early Romans. They too were at one time a most healthy and noble race. Still the Roman was essentially warlike, and warlike peoples are liable to be hard-hearted. The terrible struggle with Carthage was the prelude to a succession of conquests which were to make Rome the arbiter of the world. We are sorry to say that she abused her power shamefully. "Carthage must be destroyed" was soon applied to all peoples. After the struggle with Carthage, Rome gradually began to fall into the most terrible anarchy. There is a certain parallel between Rome at this time and France during the Revolution. Oppression led to the most shameful civil wars, with no lack of Dantons and Robespierres. But Rome's mission was not yet accomplished, and a mighty man appeared. Caesar with his great powers was able to cope with the forces that were leading Rome to destruction. He too was a power for good and in a most critical time. But jealousy, strange blindness in certain men, and fear cut short his work, and a lesser man had to attempt to regenerate the world.

Augustus took in his hands the reins of Caesar

and gave the exhausted world peace and order. In his reign, it is said, was born one of the greatest teachers of the world, Jesus the Nazarene. And great need there was for such a one. From his teachings, and professedly for their propagation, the Christian Church was soon to spring into prominence and to become in time an important factor in history. Christianity gradually rose above all the other then-existing religions of the Roman Empire and in the reign of Constantine was made a State religion.

We now come to the barbarian invasion of the Roman Empire. If a race ever needed regenerating it was the Roman at this time. Corruption has perhaps never reached such a point. The whole atmosphere of the Roman world was foul. That the coming of the barbarians was in the plan of the evolution of the race, we must believe. If they had not come, who can say what might have become of the world? It is true that they were in a primitive state of intellectual progress and that many centuries of horrible darkness were to follow their coming, but they were a new race, full of vigor and morally fine. The barbarians were soon converted to Christianity. If the church had done Christ's work, if it had had nothing else in view, the twentieth century civilization would have been in the tenth century. But no: worldly selfish power was the aim of the church. There were many noble men who did follow Christ's teachings to the very letter, but they were not able to counteract the evil of other men. What a noble uplifting the followers of Christ might have given the race if all had done their duty! But unluckily they did not, and a worse than barbarian ignorance was to settle on Europe. A horrible vampirism was to suck the spiritual life of men.

For many centuries after Rome we meet with but little light, unless that shed by the astonishing rise of the Islamic Crescent. The Arabians did bestow untold benefits on Europe in spite of a great deal of negation, sprung from jealousy.

The age of Charlemagne next strikes our eyes. This great man brought chaotic Europe into some sort of order. Out of his Empire were formed the modern nations. Though his political union did not outlive him, the social and intellectual cords with which he held Europe together in his lifetime did. After his death there was a tendency to fall back into chaos. But it was not to be so. Men instinctively sought order and protection where they could find it. Out of this feeling grew the Feudal System, the best institution for the times. But as men were not perfect by any means, it afterwards developed into all sorts of abuses.

Chivalry which came along with the feudal system revealed the advent of a new and better spirit. All this while the popes of Rome had been increasing their influence, so that by the beginning of the thirteenth century under Pope Innocent III, a man of powerful character, the temporal power of the papacy reached its culminating point. A most dangerous power did he possess, a power which could not possibly have lasted long without the most terrible results to mankind, and which could lead only to the most dire calamities. As it was, the popes did abuse their great power. If they had not, there would have been no Crusades, and no Reformation and its long train of frightful religious wars. The Western world would never have experienced such untold suffering and woe.

The Crusades, which we have just mentioned, were at first a movement heralding a change for the better. These movements have occurred all through history. But the one we now speak of seems to have been purposely led along the wrong

# THE CHILDREN'S HOUR

path. The ignorance displayed was pitiful, the hypocrisy of those who led it, appalling. But it was not all wasted energy. It did some good, though not half as much as it ought to have done.

This awakening of Europe started an intellectual movement and led to certain social and political changes. Soon princes felt themselves more independent, and finally shook off the temporal power of the popes. The nations henceforth began to lead a more active and separate national existence. The times were still dark and many and thick were the overhanging clouds. But the sun was piercing them, and the Renaissance was at hand. The wave of revival started in Italy and crossed the Alps and the Pyrenees. It spread over the German plains, the Dutch lowlands and the sunny land of France. All were awakened, wonderment was in men's minds. Gutenberg racked his brain and the world was deluged with books. Henceforth the productions of the immortals could be got for a few copper coins. This soon led men to ask questions that made the Roman pontiff nervous. Even the questioners were dumbfounded at their own audacity. But now was the time, or never, to strike out for freedom. One must fight or ever be a slave. But who should lead the fight? The question was hardly uttered before one stepped forth and challenged the Doctors. Confusion ensued. Bans and excommunications were launched forth but not heeded in the uproar. The die was cast.

As the Reformation is now a thing of the past we are able to review the events that took place more calmly, with less prejudice. We admire the rugged strength of the men who struck for principle and broke the chains that bound their fellows, but we cannot help being struck with horror at the intolerance and blood-thirstiness of the age. Protestant and Catholic were other names for fiends. Alva, Wallenstein and others gorged themselves with human victims. Was this God's work? Did men ever stop to think of Jesus Christ? Did he ever preach such unbrotherliness?

But in spite of all this, the spirit of progress was in the air, and a new light was dawning on the nations. This was the period of Elizabeth, William the Silent, Henry IV of France, and Gustavus Adolphus. Through their efforts the nations were lifted out of their old ruts; they gave new impetus to the race.

On their heels came Peter the Great, Catherine the Great, Frederic the Great, and Washington the Great. Have we not a right to believe that there was something more than chance in their coming? Can we not believe in a Law that works behind the scenes?

We have now arrived at our Age;—an Age crowded with the most varied and important events. The first is the birth of the American nation. A great event indeed, for America is to be the home of a new race. All things have been tending to demonstrate this fact.

Close on its heels came the French Revolution, the last great upheaval in Europe. Its echoes have not yet died away. Its principles were those the Liberty Bell pealed forth. It snapped the last chains of oppression, struck at the very heart of selfish power. That is why the struggle was so terrible

Lomaland Photo. and Engraving Dept.

## A LITTLE LOTUS BUD IN BIG NEW YORK

and so prolonged. But this great movement was in danger of being crushed. The Light was nearly smothered by the loosed passions of those who kindled it. But the man to prevent this appeared. Napoleon, the most stupendous military genius our race has produced, came forth. This man is a great study. The most opposite conclusions have been come to by historians about him. Wrong he did; he let his personality at last interfere with his plans; but that he did good, in justice we ought not to deny.

As a conclusion we might say that Fraternity, one of the three principles of the Revolution, has been almost totally forgotten in our struggle for Liberty and Equality. The aim of civilization is to join men in a close bond of brotherhood, their destined end. In our active pursuits along material lines we have forgotten that the human race is one and indivisible, and that brotherhood is our end. We are coming to that conclusion now, and we shall realize that the progress of the twentieth century will be mainly on altruistic lines. A great movement has been started to teach man what his destiny is, to teach him to live the heart-life. The history of this century will be mainly the history of the Theosophical Movement.

ANTONIO CASTILLO (Rāja Yoga Student)

THE shortest and the surest way to live with honor in this world, is to be in reality what we would appear to be; all human virtues increase and strengthen themselves by the practice and experience of them.—Socrates

SELF-TRUST is the first secret of success.—Emerson

## The "Tiny Tots" Visit Tent Village

GENTLY blew the breezes, softly twittered the birds, one bright morning at Tent Village, in Lomaland, when the quiet was broken by a feeling of expectancy. Soon unusual sounds were heard, children's voices, and presently along the path came the Teacher surrounded by tiny boys and girls. Such tiny tots! three or four years old, walking in grave precision, little lads holding little maiden's hands. "See," said the Teacher laughingly, as she passed the tents from which we hastened to greet her, "see the mother and her children!"

And this is what we saw—dear, quaint little maids in blue dresses and sunbonnets and serious little lads in neat coats, caps and gaiters. Soon a happy group was formed near a grove of eucalyptus trees, the little girls seated, while the boys stood together; and we all gathered round to hear them sing.

Sing? Yes, indeed, one, two, three, four songs:—"My country, 'tis of thee." "Happy little sunbeams," "Tiny buds are we"—not one verse only, but all the verses; for did not the Teacher say: "These friends cannot believe that you can sing. Now show them that you can. This is candy-day, but of course you can't possibly eat candy unless you have sung some songs!"

The little ones quietly consulted together and then without any fuss or any help they began in sweet melody and correct time and with all the words correctly pronounced.

When the singing was over the Teacher produced some candy. "Little girls first, of course"; all the little gentlemen understood that, so each of them invited a little lady to go with him to the kind Teacher and no one began to eat until each one had a piece.

Down the road comes the tally-ho, and it is time for the tots to go home. Off come the tiny caps and sweet little voices gaily cry, "good-bye, good-bye." Away goes the happy procession, and many blessings and many loving thoughts go with them, as we realize that they represent not only the joy and hope of many parent hearts, but the happy future of the world.

We grown-ups return to our work and wish that it had been our lot in life to learn self-control and freedom from self-consciousness in such a school, controlled by wonderful wisdom, surrounded by devoted teachers, and led along the steep and narrow path here strewn with roses and loving thoughts while for us it is so full of thorns and pitfalls.

A compensation and privilege remains for us however—that of giving to the children of the world this wonderful Rāja Yoga training. For this let us live and strive. B. G.

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis

Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

### Realities and Appearances

PERHAPS the most crying need of advanced scientific thought, in view of the rapid arrival of a series of new sciences — *meta*-chemistry, *meta*-electricity, *meta*-mathematics, and so on, — is a little plain common-sense metaphysics. For science has now with its own hands broken down the barrier it had erected against the intrusion of metaphysics, the world of thought behind phenomena, by reducing the hitherto imagined indivisible atom to a "center of electric stress," in other words, to a mathematical point.

The world of reality lies on the other side of that point. Is this so very difficult to grasp?

Leibnitz could not rest content in assuming that matter was composed of a finite number of very small parts. His mathematical mind forced him to carry out the argument *in infinitum*. And what became of the atoms then? . . . They were reduced to mathematical points . . . but if their extension in space was nothing, *so much fuller was their inner life*. . . . As a cone stands on a point, or a perpendicular straight line cuts a horizontal plane only in one mathematical point, but may extend infinitely in height and depth, so the essences of things *real* have only a punctual existence in this physical world of space; but have an infinite depth of inner life in the metaphysical world of thought. (Theodore Mertz, on Leibnitz.)

### Matter is only a "Stress-Point" Touched by Our Senses

Of the foregoing, H. P. Blavatsky said:

This is the spirit, the very root of occult doctrine and thought. The "Spirit-Matter" and "Matter-Spirit" extend infinitely in *depth*, and like "the essence of things" of Leibnitz, our essence of things *real* is at the *seventh depth*; while the *unreal* and gross matter of Science and the external world, is at the lowest end of our perceptive senses. (*The Secret Doctrine*, vol. i, p. 628.)

This was written in 1887, and as pointed out science has now succeeded in demonstrating the *unreality* of matter, for its centers of activity are now mathematical points. But this word unreality should not be misunderstood. Reality appertains to consciousness mainly. And in truth there is but One Reality, which outlasts successive universes; so that in the highest conceivable realms of consciousness reality has a relative rather than an absolute significance. In one sense anything we are aware of is real, and the manner in which phenomena are or appear to be related is also, relatively, real. This does not or need not prevent us from ascending or descending into other regions or states of relative reality.

### What is the "Force" there Centered?

We should try to realize that space is by no means a mathematical abstraction, but *ens*. And we should next endeavor to understand the meaning of a monad, for space is filled with myriads of monads in differing regions of subtlety — conscious entities in all degrees of simplicity or complexity, elemental, human, and divine. It is but the outer vestures of some of these, the elusive "electric stress" points, that have so far fallen into the hands of modern science.

The right metaphysical conception of a monad is of importance. The simplest example thereof is the unifying consciousness pervading one bodily frame, which is made up of countless millions of tiny lives. Within the unifying consciousness of the whole are other

monads each in charge of specific processes carried out in such perfection that the unifying monad is not directly concerned with their fields of action. So that here there is a monad containing other monads, a unity of unities. These have their living and energizing being in an inner realm of space. In turn the monad in the human frame is but one of other monads which unite in a deeper spatial realm into a greater monad, and so on.

Each of these living energizing monads, whether elemental in the human frame, or of higher nature within, among and above humanity, comes into relation with the phenomenal and sensory through the psychic, which is the true "missing link" of science, and is that which connects the phenomenal to the noetic. Every monad in charge of the life-activities of a particular system, has if alchemically separated, a specific inherent form and coherence. It is nevertheless always subject to the entrance therein of, and control by, higher monads whose sheaths are of subtler texture.

### A Unifying Conception of the Universe

Here we near the solution of some of life's problems in terms of this line of thought. For the scientific meaning and inherent force of the simple truths uttered by all the Great Teachers of humanity, is that in order to get into line with the illimitable ascent of monadic consciousness which is the rightful destiny of man, the monadic unit in charge of his bodily and mental activities has to be purified, the mentality cleared from narrow personal aims, so that the next higher stage of monadic consciousness may find entrance into and pervade his being. The feeling of unity with his other inner selves (not outer personalities), which is one (the lowest) of the char-

acteristics of the next higher monad, has to be developed, in the first place.

The unselfish performance of duty, and meditation on the manifold beauties of Nature regarded as a book of symbols, pointing unmistakably to the nature of the inner realms of the creative harmonies, of which man will yet become the conscious co-worker, may be viewed as some of the more obvious means towards the needed purification of our life.

STUDENT

### Malleable Glass

ON the subject of malleable glass, the following is interesting. It is from *The Art of Glass*, by Antonio Neri; translated from the Italian. London, 1692 (reprinted by a contemporary).

Concerning the malleability of glass, whereon the Chymists build the possibility of making their elixir, take their weak foundation from Pliny, lib. 36, cap. 26. They report, saith he, that when Tiberius was emperor, there was invented such a temperament of glass that it became flexible, and that the whole shop of the artificer was demolished, lest the prices should be abated of the metals of brass, silver, and gold, and this report was more common than certain.

Now Pliny lived in the time of Vespasian, who was the third emperor from Tiberius, so it appears this report continued long. Many after him relate the same, though with some difference, Dion Cassius, lib. 57, thus:

"At that time, when a very great portico at Rome inclined to one side, a certain architect (whose name is unknown because Caesar through envy forbid it to be registered) strangely set it upright, and so firmed the foundations on every side that it became immovable. Tiberius, having paid him, banished him from the city, but he returning (as a supplicant) to the Prince, wittingly let fall a cup made of glass, and when it was broken remade it with his hands, hoping thereby to obtain pardon; but for this very thing he was commanded to be put to death."

Isidorus affirms that the emperor in a chafe hurled it upon the pavement, which the artist took up being bartered, and folded like a vessel of brass; he then took a hammer out of his bosom and mended the glass, which being done the emperor said to the artist, "Doth anyone else know this way of making glass?" When he denied it with an oath, Caesar commanded his head to be cut off, lest this being known, gold should be esteemed as dirt, and the prices of all metals should be abated.

Neri then discusses the authenticity of these stories at great length, decides not to credit them, but concludes:

I shall conclude this argument and say that I conceive that nothing but the elixir will perform this effect, and that both of them will come into the world together.

In *Isis Unveiled*, vol. i., p. 50, H. P. Blavatsky says:

The fabrication of a cup of glass which was brought by an exile to Rome in the reign of Tiberius,—a cup, "which he dashed upon the marble pavement, and it was not crushed nor broken by the fall," and which, as it got "dented some," was easily brought into shape again with a hammer, is an historic fact. If it is doubted, it is merely because the moderns can not do the same. And yet, in Samarkand and some monasteries of Tibet, such cups and glass-ware may be found to this day; nay there are persons who claim that they can make the same by virtue of their knowledge of the much-ridiculed and ever-doubted *alkahest*—the universal solvent. This agent that Paracelsus and Van Helmont maintained to be a certain fluid in nature, "capable of reducing all sublunary bodies, as well

homogeneous as mixed, into their *ens primum*, or the original matter of which they are composed. . . ." It is into this fluid that the makers of malleable glass claimed, and now claim, that they immersed common glass for several hours, to acquire the property of malleability.

No argument against the existence of malleable glass can be derived from the fact that we have not now the secret. Daily experience proves that however complete and exhaustive our knowledge of any department of nature may seem, entirely unexpected discoveries may be made at any moment. The proving of a negative proposition by logical argument is a very risky undertaking, as the reasoning requires to be not only accurate in the ground it does cover, but certain that it covers *all* the ground. Hence such conclusions have often been refuted by discoveries which reveal for the first time the oversight committed in the reasoning. It is quite possible, indeed it must often be inevitable, that centuries of science should pass without our hitting upon some things which were known at an earlier date. More especially must this be true when the science in question has a limited field of investigation and persistently shuns other paths which earlier investigators followed.

It is evident that ancient and medieval scientists had not yet learned to separate the study of nature into compartments and to investigate the world physical as if it were entirely distinct from the interior causative worlds. We know that the elixir of life and the philosopher's stone were, in their higher meaning, attainments which transmuted the base elements of human character into the gold of true wisdom, and which transferred man's consciousness from the mortal to the immortal part of his nature; hence that the writings of the alchemists are largely symbolical. Nevertheless, the symbols being real and not arbitrary, founded on actual correspondences between the physical and interior worlds, they had their counterpart in physical science; and, just as there are a philosopher's "stone" and an elixir in the inner sense, so there are in the outer sense. The alchemist who mastered the secrets of his own interior nature also mastered the secrets of external nature. But there were some who neglected the alchemy of the soul and bent their minds solely upon their earthen crucibles, impelled by lust of discovery, power, or gain. In this quest they failed, from failure to observe the essential conditions.

Thus there is a ratio between scientific knowledge and wisdom of life; which explains why many ancient secrets remain hidden from a civilization which is in a state of considerable confusion as regards the wisdom of life. Among them are the secret of transmutation and that of making glass malleable. When greater unity among men and greater wisdom in living bring about the requisite conditions, Nature may unfold again to our awakened faculties those old secrets.

When, once in a while, some gifted individual does hit upon some such secret, it is in vain that he tries to give in to the world. In this case stupid prejudice, based on imaginary self-interest, seems to have destroyed the secret. In many cases the discoverer is also gifted with remarkable obscurity in ex-

pressing his ideas, and is regarded as a mere crank. Often his discoveries refuse to work in the presence of those whom he desires to impress. One way or another some influence avails to keep the discovery from becoming public property.

But is not transmutation now once more again in sight, since the scientists have made these new discoveries in ultra-chemistry? Professor Ramsay has found a substratum which acts as a connecting link between different elements. Naturally this connecting substratum is of a different order of substance from the elements which it threads together. We do not know whether to call it a "force," or a kind of "matter," but the objection itself is immaterial and void of force, as we have no definite meaning to attach to either term. The ancients used the word "fluid," meaning something mobile and not fixed, and this describes the ultra-matter well enough.

As to the malleable glass and its alleged connexion with the same mysterious fluid or universal solvent, modern discoveries hold open a wealth of possibilities in that direction also. One's chief hope is that chemistry, that "magician of the future," as H. P. Blavatsky calls it, may not get too far ahead of the magician that transmutes character, and sacrifice its benefits to greed and extravagance. If we had a system by which discoveries would not be published broadcast but held in reserve for the use of the race, it would be a benefit.

### The "Daylight Saving" Bill

THE "Daylight Saving Bill," which has reached the stage of being discussed by committee in the (British) House of Commons, is a plan brought forward by a man to save the hours wasted in bed on summer mornings in England. In that high latitude the sun in summer rises before 4 o'clock in the morning, but people do not breakfast before eight. The scheme therefore proposes that on the approach of summer the clock be put forward, and that this be effected in four successive stages on Sunday nights. Thus the people would be cheated into rising earlier and going to bed earlier, and much daylight would be saved for work, as well as darkness for sleep. The railway companies foresee confusion to their time-tables, and most of them are in favor of making the change of time all at once if at all; while one manager suggested the adoption of central European time.

There really seems no reason why such a scheme should not be adopted; since working calendars are always to some extent conventional and out of agreement with natural time. But it would seem far preferable if the people could be induced to observe earlier hours in summer without the artificial expedient of cheating themselves by the clock.

Besides, the working classes begin work at six and if the clock advance in summer were three hours they would have to begin at three. If in summer the stores, places of business and of public amusement, etc., in the higher latitudes, were to open and close say two hours earlier than at present, the problem would surely be solved more satisfactorily than by an arbitrary interference with mean solar time as is thus proposed.

# Some Views on XXth Century Problems

## The Two Psychologies

IN the *Popular Science Monthly* Professor Wenley briefly traces a little of the history of psychology, showing how, during the last century or two, it has slowly passed from the sphere of philosophy and metaphysics to that of physiology.

It is time to examine the English language. Granting the use of the word psychology for that region of the mind which is built up on sensation, for that part of consciousness which can have its workings measured by instruments and tabulated: what word have we left for a higher part altogether? What the instruments record and measure is the *animal consciousness*, in man as much higher than in the dog as in the dog than in the fish—but still animal. Even for it the instruments will finally turn out to be inadequate; but let that now pass.

A man can see his own mind working, watch it slip along from thought to thought, from memory to memory. He can stop it, let it go at its will, turn it how and where he likes. What he is thus watching is what the instruments of the psycho-physiological laboratories deal with and measure. *Who and what is he who watches*, and who can at any moment interfere with his will? And what is this power, will, which he uses?

If he had been taught from the first that he was not one with that mind and apparatus of sensation which because he has *not* been so taught, he can so imperfectly guide and for such short periods: if he had been trained in the power to turn himself in upon himself and away for the time from that incessantly active and prattling mind, he would have come upon that really human region of consciousness of which the ordinary man knows almost nothing, a region with which the instruments can never have anything to do. To use the word psychology for the other region leaves none for this—a difficulty which the psychologists easily surmount by denying the existence of this.

But it exists just the same, and in it lies humanity's path onward. Let the physiologists go on with their measurings; they will find out some moderately interesting things, moderately well worth knowing. But let the non-physiologist strike higher and develop the other region. Any effort is infinitely well worth while.

Katherine Tingley has said:

Our brain minds are so permeated with the false teachings of the age that we imagine it is difficult to take up our simple possibilities, grand as they are, and to feel that we can actually have the spiritual knowledge that shall reveal all things, all the secrets of life.

A false teaching of the age is that the man is this brain-mind. And the age has accepted it notwithstanding that every man knows from a moment's self-inspection that he is *witness* of his mind and desires, can to some extent dominate them, and could with practice completely dominate them. The last, and least known, work of the philosopher Kant, "On

the Power of the Mind to master morbid feelings by a mere effort of the Will", dealt with this very point. In early life he was continually possessed by a morbid tendency to suicide accompanied by profound melancholy. This he resolved to conquer and did conquer, "averting my attention from this feeling as if it did not concern me at all." The inner self, untouched and unthought of in modern "psychology" of the physiological school, can tinge the outer with every perfect hue of its sunlight.

Nor, as we suggested, will the instruments be finally adequate for the outer apparatus of life. *Will* will be found at work here too, in strange ways, guiding and transmuting the mechanical forces with which alone the instruments can deal, acting without or within the personal consciousness. In *Naturwissenschaftliche Wochenschrift* Dr. Otto von der Pfordten has an article showing that even the action of electricity on the body may be altered by the fixed will. Says a summary in a contemporary:

Of greater interest still are the cases he cites where the action of the current is neutralized by a man's strained expectation or attention. Electricians, he says, often touch parts of the machinery to ascertain if there is a current in them; and while this conscious and deliberate act results in no harm, unintentional contact with a less powerful current proves fatal. In experimenting on himself, Jellinek found that an unexpected shock of 350 volts was terrible, whereas an expected shock of 500 volts made little impression. But this was a bagatelle compared with the exhibition of courage given by Herr von Dobrowsky, who broke a wire containing 30,000 volts and picked up one end of it in the presence of several dismayed experts, without suffering the least harm.

Dr. von der Pfordten comments:

There is something impressive in this idea that the will-power in such a case opposes itself to death as an equal force and comes out triumphant.

It can oppose itself to death in higher ways than that. There, the death-tendencies of matter would finally conquer it anyhow. It achieves its highest work in continually holding consciousness up to its highest, out of the reach of sensual desires, until at last the man gains certain knowledge of his immortality, "the spiritual knowledge that shall reveal all things, all the secrets of life." STUDENT

## The Egotistic Dam

AN English writer, who appears to know his Nietzsche rather from quotations than directly, wondering why there are not more "supermen" visible in modern life, ascribes the cause to alcohol. Alcohol prevents the higher faculties from appearing, and wipes out or dulls those that have appeared.

Then it turns out that by superman he means man of genius, not a mere embodied triumphant passion. Leaving Nietzsche, his thesis is therefore that the cause of paucity of geniuses is alcohol.

Alcohol is capable, certainly, of blotting out genius, dulling it, and preventing it from arising.

But that it is not the only cause, nor the chief, follows from the entire absence of ratio between the abstinence of countries and their production of men of genius.

There are a lot of causes why men of genius are few. One of them, perhaps not the most important, but the one that comes first to one's mind, is egotism. This is a bar to every sort of human attainment which demands the higher play of consciousness. The state of genius—for a man of genius is one subject to, or with the power of producing, such states—has temporarily to quell egotism before it can function. A musician's flow of inspiration necessarily ceases the moment he thinks of the renown that this composition will bring him, and must be taken up again below where it was broken. Every heroic action depends on forgetfulness of self for the time it requires. The oration of a real orator begins to ring false the moment he thinks of himself and preens himself on the impression he is making.

If egotism is strongly present in consciousness at all, the mind can never behave as if it were not there. It cannot be altogether laid aside during moments of inspiration by any power of concentration. If it does not visibly intrude, it is present as a load, a clog, holding the mind back from its highest possibility. If it were wholly absent, mind would become almost divine in its freed power to reach transcendent levels and to create into form what it found there. Genius and egotism are in inverse ratio to each other. Many precocious children are actual geniuses. But flattery so cultures their egotism that the vitality of the tender bud of genius is entirely absorbed, and in a few years no mark of it is left.

One rarely or never hears denunciation of egotism from the pulpit, and therefore no prescription for getting rid of it. But inasmuch as genius comes from the spiritual nature and has to paralyze egotism temporarily in order to get out: so is egotism a bar to that spiritual culture and attainment more narrowly so called. For higher spiritual attainment egotism must be *killed*.

Egotism is not egoism. Egotism is an inflammatory disease of egoism which cannot be cured until it is recognized. The recognition is much hidden by our restricted use of the word selfish. The precocious child may be duly forbidden to be selfish, grasping. It may not take all the candy in the bag, but it may try to take all the notice of the visitor, all the applause of the table—and the corresponding desirables of later life. It may develop all the ambition that is latent in its nature. There will be no correction there. In fact the ambition is called laudable, healthy. Yet it is possible to teach it to develop every faculty for the purpose of serving, giving, instead of getting. That is the only way to save the bud from either dwarfment or total destruction.

And if the religious people who are so anxious for "salvation," for the light, were to seek it that they might *confer* it, they would make their seeking infinitely surer. STUDENT

## INTERIOR OF THE MAHAVIHARA, DAMBULLA, CEYLON

### The Jewish Discoveries in Egypt

THE recent Jewish discoveries in Egypt, alluded to in the *CENTURY PATH*, vol. ix, no. 12, have an important bearing on Biblical matters.

M. Clermont Ganneau's paper in *Le Temps* is translated in the *Boston Transcript* for last Nov. 9th, and he says:

A sensation among the savants and general excitement among Biblical historians have resulted from a group of recent discoveries.

It is not at Sinai, his cradle, nor at Jerusalem, his throne, but far from either on the frontiers of Nubia and Egypt, close to the tropics, in a little island dividing the first cataract of the Nile, where you would hardly expect to encounter that divinity in exile, that the old Jehovah, a Jehovah of the fifth century before our era, rises at last to tell us by the mouths of his adorers, transplanted with him, things that are perhaps destined to metamorphose orthodox exegesis. Today it is from the south that the light comes, and in a fairly surprising way.

The land of the Pharaohs has a double fertility—that of the present and that of the past. This land where flourished the papyrus is holy ground for archaeologists. It continues to yield Latin, Greek,

Egyptian, Coptic and Arabic papyri. Each day brings a new find. Yesterday it was certain lost comedies of Menander, a joy to the humanists. Not long ago it was the Logia of Jesus, taking us back to the very springs of Christianity. Tomorrow it may be some Hebrew Bible.

The French expedition, working with a German expedition which was also there, discovered a lot of Aramaic manuscripts, the language then used by the Jews. One remark made by the explorer is that the Jews—despite the traditional interdict, have not been afraid to duplicate the now ruined temple at Jerusalem by founding in this place of exile and colonization a sanctuary of Jehovah which would have made Jeremiah howl and perhaps did.

The petition which is among the documents discovered, appealing to the Persian governor of Judaea on behalf of a temple which the Egyptians had destroyed, sets forth that the Egyptian priests got an order to destroy the temple on the ground that it had been built by their fathers long ago.

How extraordinary it is that our religion should be so largely based on the books of the

*Old Testament*, when this is merely an odd collection of writings, put together nobody knows when or by whom! What bearing do these new writings of the Hebrews have on the question? And these explorations are yet in their infancy. STUDENT

### Mahavihara (Great Temple), Dambulla

THIS temple, hewn out of the solid rock, measures 160 feet by 50, whilst its greatest height is 23 feet. It contains 53 statues, most of them larger than life-size, and every available inch of walls and ceiling is covered with frescoes, some symbolical, others representing events in early Sinhalese history.

It dates from the first century B. C., when, together with the adjoining caverns, it was used as a hiding-place by King Walagambahu, who had been driven from Anurādhapura by Tamil invaders. And when, after being for fifteen years a fugitive, this monarch regained his throne, he caused these caves to be made into rock temples, thus showing his gratitude for the asylum that they had afforded him. ## Eternal Motion

A PHYSIOLOGIST once discovered that minute particles suspended in a thin liquid are in incessant vibratory motion — known, from him, as Brown's molecular motion. It has never been measured nor its cause fathomed.

It has recently been shown that the molecules of gases and of condensing metallic vapors exhibit the same rapid motions. By a special little laboratory maneuver the effects of these motions can be rendered visible to the eye. For solid particles this is very easy. A drop of the milky sap of the spurge (*Euphorbia*) is usually selected to show it. The milkiness consists of minute specks or granules. Professor Molisch, who first noticed that microscopic magnification is not essential, says:

The slide bearing the drop of sap should be held nearly vertical, with the sun's rays falling obliquely upon it, and viewed by transmitted light. When the most favorable position is found, the motion of the microscopic resinous particles is strikingly revealed by a peculiar and lively dancing and shimmering of the brilliant interference spectra which they produce. Another very good object is Indian ink, rubbed up with water.

It is one of the ultimate phenomena of nature, indeed *the* ultimate phenomenon, motion which cannot be traced back to any other causal form of physical motion. Visible in the molecule, Theosophy teaches that it obtains also in the atom, in the intra-atomic corpuscle, in the elements of which *that* is composed, in the innermost units of substance. It is the first manifestation of that universal Life which pertains as well to the primal units as to their furthest and most complex syntheses. It is the root of all the forces, and their place of final resolution. It is the impress of Cosmic Will on that which, without it, becomes an unthinkable abstraction. Through it only, does this abstraction enter upon the first stage of its career as matter. STUDENT

## The Divine Subconscious

NOT only in the modernest science but in the modernest philosophy, does one hear echoes — very exact ones, too — of ancient thought. The doctrine of the "subconscious," the "subliminal," is surely modern enough; but as surely it is ancient. One thinker just dead, has dedicated several volumes to the elucidation of its mysteries; elucidating some, by the way, which are not there at all.

According to Dr. Thomas Jay Hudson, then, the "subconscious mind" is to be found at work on every step of the ladder of life, from man downwards. When we get down near the bottom there is nothing else, no other mind. Evolution mainly consists in the evolution of the other mind from nothing, or almost nothing, to the complexity which it has attained in man. But this ordinary, thinking mind, being still under evolution, is imperfect, liable to much confusion and error. In the subconscious, which directs the deeper processes of life, is man's divinity and almost

infallibility. All the way down, its action is relatively perfect and based on relative omniscience. In the life and structure of the amoeba, for example, the speck of living jelly in the ponds, this subconscious, inasmuch as it has built up the complex protoplasm of that little body and guides it through the processes of respiration, digestion, reproduction and the rest, shows itself a master chemist, electrician and mechanic. And the very march of evolution shows that it has plans that must be called divine, since they ultimate in divine results.

According to this view, which needs, however, a good deal of modifying, it is not so much this mind that evolves, as the other, that which in man does his conscious thinking. Pressing the theory one step beyond those which the author has taken, it follows that man's further evolution consists in opening his conscious mind to this divine mind behind and within, blending the two and thus reaching consciousness of divinity and immortality and becoming a conscious co-worker with nature instead of a worked-upon by nature.

Adding that to the theory, we can look back to one of the *Vedānta Sūtras* from old India, an echo of a still older Aryan teaching:

Although one and the same Self is hidden in all beings, movable [animate] as well as immovable ["inanimate"], yet owing to the gradual rise of excellence of the ["conscious"] minds which form the limiting condition of this Self, Philosophy declares that the Self, though itself unevolving, reveals itself in an evolving series of beings and so appears in forms of various dignities and powers.

Man's duty consists in finding this Self in himself, gaining thus the power to subdue those tendencies which take him aside from his path. For as his (outer) mind developed, it seized (rightly enough and accordantly with the plan) his or its heritage of that Will behind all — but then at once began to will wrongly in its new freedom, bringing upon him all the troubles from which he now suffers. STUDENT

## The Earth's Water-Cloak

THE newer theory of ore formation has suggested to a Russian geologist that somewhere in or beneath the earth's crust there may be a complete layer or jacket of water.

Ores lie in veins. How did they get concentrated there? By deposition from water, of course. But did the water come up from below or get down from the surface?

The eruptive rocks bring up metals more or less disseminated through their substance. Surface water gradually percolates through them, dissolves the metals, goes deeper, becomes hotter and perhaps more acid and therefore a better solvent; but finally has to turn back. The weight of the advancing column constitutes a greater and greater pressure, and the deep end of it is expanding with the increasing heat. At last it can get no farther and has to turn sideways and upward, creeping through fissures and faults, depositing there its dissolved metallic burden as ore

veins, and finally reaching the surface as springs and geysers.

So goes one theory. The other rests on the fact that fresh lava from volcanoes contains and emits vast quantities of steam, and goes on to suggest that our oceans may not have been deposited from the exterior but brought up from the interior. As the deep water ascends it fills the cracks with ore leached from the deep crust. There may therefore, it is suggested, be a far-in layer of steam under such pressure as to be liquid, resting on the top of another consisting of the composing elements of water not yet associated, also under liquifying pressure. Somewhere below this may be a factory in which elements are being generated from a protyle perhaps yet unknown. STUDENT

## Lies, — Lies, Statistics

IN the vivisection controversy now going on here and in England, we read daily of the successes of the diphtheria anti-toxin. Figures are quoted showing the amazing reduction in the deathrate from that disease since the discovery of the germ and the employment of the anti-toxin.

There may be a reduction, but it is not proved. The period of the supposed reduction corresponds with the period of microscopic examination of the throat secretions. Diphtheria, like all other diseases, is of every grade of severity. Some cases are so slight as to attract little notice, to be classified among simple sore throats, "touches of quinsy" and what not. But in most of these, now-a-days, the properly suspicious and alert doctor either uses his own microscope or avails himself of a skilled public microscopist. The right label is given, the serum duly used, and the recovery, which might have taken place anyhow, or from quite simple treatment, is ascribed to the injections. But falling statistics of deathrate would have resulted from the increased correctness of diagnosis independently of the serum. Until, therefore, we have two sets of figures, both resting on microscopic diagnosis, one of cases treated with the serum and one without, we can form no judgment at all.

There is fortunately no doubt that the use of serums is a transitory measure which fuller knowledge will render obsolete. They whip or stimulate the blood to the production of substances requisite to neutralize the toxins of, or to paralyze or destroy the bacteria. They are like the flick of the whip to the overburdened horse.

A wiser medicine will do better than that. It will have learned what the blood lacks or produces with so much difficulty. And it will supply that lack. It may supply it on the chemical side, or meet the deeper need of vital energy. At present the almost separate science of medical electricity — counting light, X-rays, and radium emanations as forms of electricity — is groping in the right direction. And one may easily predict that when its groping has become finding, the serums will take their place with the medieval toad extract and dead man's left third finger. STUDENT

Automatic Sheltering of  
Fruit Trees

A NEW automatic device for sheltering fruit trees from frost is described by the Paris correspondent of the *Scientific American*. Around the trees, on posts, are arranged furled curtains and blinds, of matting and canvas. Some of them are on rings, like curtains, and draw sideways; yet others are rolled up like blinds, and let down; over the wall-fruit there are descending shades affixed to the wall. All the shades being geared by wires to a central operating station, they can be simultaneously unrolled from that station; and in the case of frost this is done automatically. A special kind of thermometer releases a heavy counter-weight and actuates the machinery.

Thus the grower is enabled to shelter all his vines or trees without even waking up, and that without any loss of time in going from one to another. The mechanism also provides for the retraction of the shades automatically when the frost is over. There is an electric signalling device which notifies the proprietor whether the apparatus has worked or not. In the case of other atmospheric disturbances, such as a sudden hail-storm, the apparatus, though not then automatic, can be instantaneously operated by electricity from a distance. T.

## No More Coal!

THE extravagance of Americans and English has been attributed to their prosperity, and the pinch may teach them economy in the use of the soil, coal, iron, wood, etc. Mr. Carnegie gives some terrible statistics as to the amount of fuel energy wasted in the production of electric light, making it to be but a fraction of one per cent! This is incredible extravagance and of course the same spirit of wastefulness is prevalent in other industries.

A consulting engineer for an electric company has been declaring that coal may give out within our time. We can see the end of the supply, he says.

But he is optimistic and declares we shall be all the better for the absence of coal fumes. Water-power he regards as the resource that will keep us from freezing in winter; but that needs looking after too. When we are forced to economize we shall collect all the

power, even from small creeks, which now runs to waste. Water-power will generate electricity to be used for heat and light.

Other resources are going the same way, but economy can do wonders, especially when aided by science. Another thing is that we may learn to do without some things that are considered necessities so long as there is plenty. When things get serious, the government will have to get to work and stop all the skimming of profits and organize the utilization of resources on an economical plan. E.

## "Waste" in Nature

WRITING on how to utilize "the world's stupendous waste," a contemporary expresses some rather confused ideas. We do not quite gather whether it is the waste of human powers that is meant or the waste which Nature is alleged to commit. "A system of education must be found to remedy this evil by eliminating wasted human effort." So far good. But we read that in time the cyclone and the flood will be harnessed and the mighty heat of the sun and the energy of the tides used to turn the wheels of commerce. The powers of Nature run to waste we are told.

Now both the economizing of human powers and the conservation of natural resources are excellent and necessary; but to the question as above broadly put there is another side. The wheels of commerce are not every-

thing, and it is possible that the great Mind and minds that energize in the universe have other uses for their powers than to cook our food or warm our bodies.

Relatively to Nature, Man is both small and great: small, if we consider only his petty selfish interests; but great, if we consider what he is potentially and what he may become. It is absurd to think of Man, the petty, trying to make all Nature lend herself to his little schemes. But we may think of Man as gradually learning more of Nature and her purposes and workings and adapting himself thereto. One can hardly imagine that the energy of the tides, because it is not all utilized to turn power-plants, is therefore wasted, or that the beams of the sun have no other use than to furnish caloric and motive power for Earth civilization.

"Waste" is a relative term—relative to our degree of understanding. Poets have sung about flowers born to "waste their sweetness on the desert air"; but that implies that flowers have no other use than to be admired by Man. When we have learned to regard the universe as teeming with conscious life, and its outer garb as the manifestation of great intelligences, we shall more readily understand that the winds and waves, the rocks and plants, may be performing some great drama in which we have hitherto failed to participate, and that the energies thus displayed are not wasted. ## EACH IN HIS OWN TONGUE

William Herbert Carruth

A FIRE-MIST and a planet,  
A crystal and a cell,  
A jelly-fish and a saurian,  
And caves where the cave-men dwell;  
Then a sense of law and beauty  
And a face turned from the clod,—  
Some call it Evolution,  
And others call it God.

A haze on the far horizon,  
The infinite, tender sky,  
The ripe, rich tint of the corn-fields,  
And the wild geese sailing high,  
And all over upland and lowland  
The charm of the goldenrod,—  
Some of us call it Autumn,  
And others call it God.

Like tides on a crescent sea-beach  
When the moon is new and thin,  
Into our hearts high yearnings  
Come welling and surging in,—  
Come from the mystic ocean  
Whose rim no foot has trod,—  
Some of us call it Longing,  
And others call it God.

A picket frozen on duty,  
A mother starved for her brood,  
Socrates drinking the hemlock,  
And Jesus on the rood;  
And millions who, humble and nameless,  
The straight, hard pathway plod,—  
Some call it Consecration,  
And others call it God.—Selected

## Theosophy and Optimism

A RECENT writer, speaking as an optimist and against pessimism, shows that pessimism is our personal discontent reflected upon our outlook on life in general. We do not sufficiently enter into the larger life of humanity or sufficiently realize the possibility of life existing apart from our own perceptions. Even the personal craving for immortality is based upon this. And he speaks of the possibility of a man whose whole future might be clouded by incurable disease, yet being such an optimist that he could throw himself resolutely into sympathy with the mighty will of Deity and think of the onward march of humanity.

Yet how can we derive comfort in our sorrows from the reflection that there is a larger life, outside our own, which is prospering? As another writer says, each individual grieves and rejoices in isolation, and his secret tragedy lies in knowing that his feelings are secret; we do not think and feel together as one body, but each "most forlornly and sadly alone."

One can not but admire the courageous optimism of the former writer, whose intuition of the truth speaks out from his heart. Current beliefs and philosophies give him no warrant for such an optimistic conception, yet he entertains it just the same. He seeks his

consolation in the reflection that there is a larger life and that it is cowardly and selfish to take so much care for our personal life. The other writer points out that a man can hardly be expected to solace himself for his personal and only too real sorrows by contemplating the beauty of a life in which he has not and can never have part or lot.

The key to this problem lies in the tacit implication of the former writer that we do have part and lot in this greater life. His philosophy sees no way to admit this, but his heart speaks it out all the same. We are here right up against one of the terrible shortcomings of conventional thought—that it provides no adequate explanation of the facts of experience and does not conform with our innate sense of justice, right, and truth.

Deep thinkers see well enough that Nature and Universal Law are not regulated on the principle of regarding each man as a separate personal unit, but that they move on a larger scale. Hence some of them exhort us to climb up out of our narrow personal life and take part in this larger life, and so we shall be at rest. But they do not give us much hope as to how to achieve it. The best they can do is to depict a kind of mystic exaltation such as has enabled a few rare souls to lift themselves out of their afflictions and be at peace in spite of their surroundings. But this does not appeal to the great majority.

Ecclesiasticism teaches us that we have no escape in this life, but that our reward lies in the future, a belief which has comforted many, but can not comfort the many more who do not believe in it; a belief which is moreover, emasculating to the race. Science can tell us nothing about any other life than the life of the senses, and often goes out of its way to deny the existence of that with which it claims to have no concern.

But Theosophists do not believe that humanity is destined to toil and grieve eternally and make the best of it with such poor solaces. They regard the trouble and unrest of humanity as an evil which ought not to exist and which can be remedied.

Moreover they know that it is possible for man so to sublimate his nature that he can consciously share the larger life of humanity and so escape from the tyranny of personality. And this is to be done, not by standing on a pillar or getting into a state of religious exaltation, but naturally and healthily.

Some philosophers tell us that Man is a Soul and that his life is not confined by the limits of time or space. Theosophists believe that the Soul-life can be made a reality.

We can not raise the mass of humanity to a high plane all at once, but we can endeavor to remove the false conceptions of life which have so long weighed down the intuitions, aspirations and achievements of man, and to replace them by truths which will in time regenerate society. The chief of these false ideas are that our life on earth is a unique episode, the prelude to an eternal existence away from earth; and the awful idea that there is no other life at all; ideas that people feel to be false and yet do not see how to gainsay.

The idea of the total destruction of the individuality is as false as the idea of the perpetual preservation of the personality. Our

personality is continually changing; the individuality remains intact. The individuality is the essential life; the personality is the ever-changing vestures of the Soul. We forget our personality often, but we do not lose our identity; we are happiest when we forget our personality.

The road to freedom is to be sought in the gradual purification of our nature so that the sense of separateness and personality becomes fainter and the life becomes more merged in the common interest. Concentration on the personality brings misery, even to the verge of insanity. Those who do not think much about their personality are the happiest. This is perhaps familiar philosophy, but in Theosophy it rests upon facts in Nature.

Theosophy teaches that this purification of the nature is not a transcendental state of ecstasy attainable only by saints, but a natural step in evolution, which all of us have to take. It extends even to a full consciousness of our oneness with humanity and to an ability to bridge the gap of death and attain to a consciousness of the eternal existence of the Soul.

It may be objected that these ideas are too visionary; but if so, so are all ideas of the same class, including those of science and those of religion; and these ideas are at least more reasonable. But they are not visionary and impracticable. If we take a child, we may either bring it up in the prevailing religious dogmas and scientific doubts or in the light of these broader teachings.

And Theosophists claim that children reared in the light of Theosophy should develop characters fitted to withstand the problems of life, and natures ready to unfold to a greater range of knowledge. By bringing up children in the light of Theosophy, seeds can be sown for the future.

Meanwhile much despair can be prevented by destroying the dogmas, theological or otherwise, which blight our faith and hope, and by replacing them with truths that appeal alike to the heart and the understanding. If we cannot remove the awful conditions of poverty bodily and instantaneously, we can at least strike at the root that breeds such conditions, and bring back knowledge and hope to humanity. E.

THERE being but ONE Truth, man requires but one church—the Temple of God within us, walled in by matter but penetrable by any one who can find the way; *the pure in heart see God.*

*The trinity of nature is the lock of magic, the trinity of man the key that fits it.* Within the solemn precincts of the sanctuary the SUPREME had and has no name. It is unthinkable and unpronounceable; and yet every man finds in himself his god. "Who art thou, O fair being?" inquires the disembodied soul, in the *Khordah-Avesta*, at the gates of Paradise. "I am, O Soul, thy good and pure thoughts, thy works and thy good law . . . thy angel . . . and thy god." Then man, or the soul, is reunited with ITSELF, for this "Son of God" is one with him; it is his own mediator, the god of his human soul and his "Justifier." "God not revealing himself immediately to man, the spirit is his interpreter," says Plato in the *Banquet*.—*Isis Unveiled*, vol. II, page 635 (H. P. Blavatsky)

## VOICES OF EARTH

Archibald Lampman

WE have not heard the music of the spheres,  
 The song of star to star, but there are sounds  
 More deep than human joy and human tears,  
 That Nature uses in her common rounds;  
 The fall of streams, the cry of winds that strain  
 The oak, the roaring of the sea's surge, might  
 Of thunder breaking afar off, or rain  
 That falls by minutes in the summer night.  
 These are the voices of earth's secret soul,  
 Uttering the mystery from which she came.  
 To him who hears them grief beyond control,  
 Or joy inscrutable without a name,  
 Wakes in his heart thoughts bedded there, impearled,  
 Before the birth and making of the world.—Selected

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

## Question

Why is it necessary for the divine spark, the Ego, to make this descent into material bodies and evolve materially? Of what use can these material experiences be in our later spiritual lives when we shall no longer need to incarnate?

## Answer

The only way in which we can evolve to a condition where the teachings of incarnate experience are no longer necessary is by the developing process of incarnations. The descent into matter was the beginning of a wider cycle of experience which went deeply into the mysterious powers of matter in order to acquire the impetus to rise to still greater heights. Life—which is consciousness—proceeds in spirals, gradually going forward while also broadening out into wider curves.

In *The Key to Theosophy* Madame Blavatsky says:

Try to imagine a "Spirit," a celestial Being, whether we call it by one name or another, divine in its essential nature, yet not pure enough to be one with the ALL, and consequently having to purify its nature so that it may finally reach that goal. It can do so only by passing *individually* and *personally*,—i.e., spiritually and physically—through every experience and feeling that exists in the manifold or differentiated Universe. It has, therefore, after gaining experience in the lower kingdoms, and having ascended higher and still higher with every rung on the ladder of being, to pass through every experience on the human planes. In its very essence it is THOUGHT, and is therefore called in its plurality *Mānasa-putras*, or "Sons of the (Universal) mind." This *individualized* "Thought" is what we Theosophists call the *real* human Ego, the thinking Entity imprisoned in a case of flesh and bones.

The Universal Mind clothes itself in matter because that is the garment worn by students of material things. This costume is put aside at death and resumed again at the beginning of another term of incarnating experience. What we call life is not meant to be the sickly, painful, unhappy existence which men make of it. Everything is vitalized by the One Life, and that part of the Universal Mind which is in the lower kingdoms is like a happy child willingly obeying the natural law while being led along into new fields of experience by Mother Nature.

In the mineral world the great rocks patiently stand age after age learning the slow process of disintegration which prepares their particles for new forms of experience. At

nature's bidding, the acid and alkali unite and separate, without protest or fear or failure, in harmony with the law. The gases follow nature's law in combining, acting together and then separating for new experiences. The life in Oxygen for instance eagerly contacts matter at many points; now disintegrating iron into particles of rust; now forming water with its companion Hydrogen; now a free gas partaking of plant experience or entering into man's body or helping to break up a decaying mass. It does not shirk the unpleasant things or pick out the easy ones.

In the vegetable world, the fresh wonder and joy and fragrance of every springtime rebukes unhappy, foolish, restless man with his misused powers and greater possibilities. The life in every unfolding leaf and seed, in grass and flower makes them sweet and vital with the joy of new experience in even this limited kingdom of matter. There is no indifference or laziness, no sulking or sinning here; each green thing is happily growing toward perfection of its own kind.

The lower forms of animal life are active in their narrow field which is to them an advance upon the limitations of vegetable experience. The higher animals begin to show the incarnating life taking on a wider range of motion and becoming more conscious of its powers. Without the higher light of reason and conscience the animal instincts of self-preservation and sensation often lead to naturally selfish and cruel action. But the animals in their natural state are not perverted or depraved. They are not sickly or dissatisfied because, while below man in possibilities, they are living up to their natural status of evolution.

In man the "individualized Thought" or real human Ego takes on the highly organized human form with its possibilities. He also has the power of choice between following the instincts and desires of the animals below him or of becoming conscious, even on earth, of his essentially divine nature. Man has received the light of Manas, or mind, which acts as a link between the divine and the animal nature. When he vivifies the bodily sensations and desires with the mind principle which the animals lack, they are intensified into an activity which bewilders and, if unchecked, finally enslaves him. When he has sounded the depths of this experience he finds the penalty of the broken law so heavy with sickness, sorrow, and despair that he is at last scourged onward toward his higher nature. Having eaten of the tree of knowledge of good and evil, in time the whole force of his personal self—the natural powers of the material world which he has experienced—is transmuted into activity by the higher Thought of this individual center of the Universal Mind.

The differentiated "Spirit" after experiences with the "heresy of separateness" is finally evolved into a more highly organized being. The perfected man is able and ready to help nature to raise matter upward and to help humanity to attain the goal toward which all nature strives. He could not know either the needs or the possibilities of the material world except by his own experience. The "angels" who are bright, pure, sinless, spirits, know the happiness of the spiritual life; but

perfected man will be more conscious of its peace and harmony because of his knowledge of the dark side of existence by which to measure values. Like the prodigal who has lived upon the unsatisfying husks of the animal life he will know that there is no place like his "father's house."

The law of spiritual growth is reflected in the law of material development where the seed of plants or the cell of an organism differentiates into cells of different parts or organs. The acorn divides into many cells which differentiate into trunk and branch and leaf and seed to make up the higher organism and larger life of the tree. The animal cell divides into many differentiated cells making up various organs which co-operate to give greater range and power and skill of action to the animal kingdom. Everywhere nature divides units into individual centers of functional activity that she may bring them together again in a more conscious unity. This is evident even in the highly-organized conditions of modern society. Here the industries and professions are differentiated into specialties which are able to co-operate with greater power and ease and usefulness. That as much evil as good seems to result from the existing social evolution simply means that the different organs or organizations do not yet stand in their natural, normal relation to the complex social organism to which they belong. Not in vain, however, has the industrial soul suffered through long cycles. The weary old world is sweeping round the cycle toward a co-operation based upon the fundamental unity of the race and the natural brotherhood of man.

This great question of the Ego's purpose in descending into matter has its analogy in everyday life where we seek advice from those versed in the puzzling subjects and we turn for sympathy to those who have suffered.

It is said that the consciousness of power is the most exquisite of all sensations. If the knowledge of nature's forces and of the human power for helpfulness and divine comradeship were not worth the price of incarnation, we should not be here.

The great karmic law is the artist which uses the materialized colors of the universe to paint the individual pictures of a common humanity upon the screen of time. Here the blank canvas and the untouched colors potentially contained all the possibilities of the finished picture of men made perfect; but the ideal figures exist only in thought until they are materialized by individual experience under the karmic law. Colors are the materialized shadows of the different rays of light, and pictures are made up of lights and shadows. However clearly the light of truth illumines the screen of time, it is only by the shadows of material experience that the Ego which is divine in its general consciousness becomes individually perfected in its wisdom.

R.

WHILE heredity has something to do with the difference in character as to force and morale, swaying the soul and mind a little and furnishing also the appropriate place for receiving reward and punishment, it is not the cause for the essential nature shown by every one.—William Q. Judge

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## "The Law of Kindness"

"FOR the benefit of the peoples of the earth, and of all creatures," is a phrase which must be well-known to all members of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY. It places before us the broad scope of our work, and the good that we seek to reach. It recognizes the great principle, the unity of all life, which is the central teaching of Theosophy; to live which we must practise the law of kindness. In it we are reminded of the all-embracing spirit of St. Francis d'Assisi, who spoke of "our brothers the sparrows," and "our brother the sun." It is of great importance that we should cherish a spirit of kindness, of brotherhood to all the human family, irrespective of color or creed, rank or station in life. But we should not stop here, we should feel the spirit of kindness, and exercise it towards "all creatures," for Life is One. And there can be no doubt that as we develop towards the All-merciful our hearts must widen and deepen in their compassion for all that lives. It is true that we should grow naturally, step by step. The love of home, the wider love of friends, the love of country, and then the larger patriotism which embraces all lands and all peoples — these should be the stages of our growth. He is but a poor patriot who merits the sharp criticism of the late Lord Beaconsfield, "a man who loves every country except his own!" Readers of Dickens are familiar with the active philanthropist in *Bleak House*, Mrs. Jellyby, who was too busy with her correspondence about the savages of Borriboola Gha to care for her children and her home. The true patriotism, the true charity, the true philanthropy expands naturally, step by step, from what is nearest to what is more remote, nor should we "lose the childlike in the larger mind." In the natural growth each step comes in its proper order, and then nothing is lost. The man who does not forget old friends is the better able to make new ones. Each lesson properly mastered as we come to it makes us fitter for mastering a wider experience.

He who would truly help must render assistance out of that perfect sympathy, or fellow-feeling, which is born out of much experience. To be able to be truly kind is indeed a god-like power, and it helps mightily to uplift the world. It is much akin to that wonderful, that divine, all-conquering power which we

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

may exercise if we will, to "overcome evil with good": the only *real way* by which evil can be overcome, just as the influx of light is the only way of overcoming the darkness.

The word *kindness* is a good, plain, old-English word, simple and strong. "Compassion" has something of the same meaning, but "to be compassionate," generally calls up the other idea of some one in need, or in distress; just as "pity," or "charity" calls up the idea of a person in poverty or in suffering. Now the idea of "being kind" does not necessarily imply that the person doing the kindness occupies a higher ground in any way — equality is quite consistent with the manifestation of kindness. There may be kindness towards an equal, or towards an inferior, or towards a lower animal; but when we think of the act of being kind we can do so without any reference to the relative positions of giver and receiver. We forget ourselves for a moment in the One Life, and cease to think of higher and lower — only of *being kind*.

We are nearer heaven than we think, for, in being *truly* kind we live the Higher Life, which is "closer to us than breathing, and nearer than hands or feet." The word *kindness* is perhaps the only word in the English language which gives a hint that the nature (or kind) of man is essentially kind or good — a truth which was taught many thousands of years ago in the ancient religion of China; and it has been brought to light again by Theosophy, the Wisdom-Religion.

Of course the real kindness must not be confounded with actions done for the sake of reward. There is often a keen calculation exercised by those who perform certain good acts. A large donation to a church or a charity may be given — as was wittily suggested once — by way of an "insurance against fire"! There is no real giving, no real act of being kind, where we "hope for as much again." The exercise of the spirit of real kindness is itself the highest and purest reward; but it can only come when this is not thought of,

and when the giver is not calculating the result. In other words, the real kindness is spontaneous, it is a ray of the Divine shining through the mists of our present life.

There are many things which go to make up our idea of the perfect man, such as truth, justice, strength, patience, courage, and others; but the grace of

kindness is the soft light of the inner Self that irradiates the whole. In *The Voice of the Silence*, H. P. Blavatsky speaks of "Compassion" in a way which agrees with all that we have said. "Compassion is no attribute. It is the Law of LAWS — Eternal Harmony, Alaya's SELF," etc. Sir E. Arnold, in *The Light of Asia* gives us the same idea; for though he says the Karmic law "knows not wrath nor pardon," yet "the heart of all is Love, the end is Peace and Consummation Sweet." According to Jesus the true Children of the Father should be like the "sun that shines upon the evil and upon the good."

Love your enemies, and do them good; and lend, never despairing (or despairing of no one); and your reward shall be great, and ye shall be the Sons of the Most High: for he is kind to the unthankful and the evil.

Such is the lofty ideal that is set before us, and we know we can attain unto it, for we *can be kind now*, notwithstanding all our limitations. It is true we are not often kind to our enemies, nor to the unthankful and the evil; but we *have* exercised the power of being kind, and its perfect extension is possible; it is a matter of time and growth.

Theosophy keeps this truth before the eyes of men when it assures them that they are temples of God, or that the Higher Self is Divine. As we overcome the lower self by the Higher our inherent nature manifests itself, and kindness shines forth as the sunshine when it bursts through the clouds.

Kindness to "all creatures," and not to human beings only is implied in the teaching that Life is a Unity. Cruelty to the lower creatures is unmanly, and those who are guilty of it injure their own moral nature to a very serious extent. What should we think of beings as much higher than man as he is higher than the beetle, if, instead of helping and protecting us, they tortured us for some fancied gain to themselves? Yet this is what some beings in the human form do to the lower

# The Theosophical Forum in Isis Theater

S a n D i e g o C a l i f o r n i a

animals. A greater care, and thoughtfulness, and kindness to "all creatures" will be one of the sure signs of the coming New Age.

Of course the true kindness is wise and not foolish, and it is not blunted in one direction by being sensitive in another. It has sometimes been observed that men or women have bestowed such inordinate care upon some pet animal that they forget to be kind to their fellow-men. In all such cases it may be safely said that an element of selfishness enters very largely into their unwise manifestations of kindness to the lower animals, to whom they have given their whole attention almost. In this, as in all things else, wisdom should guide us. It is when true kindness to all beings works in harmony with wisdom that the "new heavens and the new earth" will be revealed. We keep back the whole world by our unkindness—our "inhumanity to man," and our cruelty to animals. The apostle says, "The creation waiteth for the revealing of the Sons of God." And also, that "the whole creation groaneth and travaileth in pain together until now."

We do not require any elaborate preparation to act kindly, to act as "sons of God." We can begin at once. We do not need a learned creed. The man or woman who acts kindly possesses the universal religion, and the universal language that touches all hearts. The kingdom of heaven is within us, and by opening the door of the heart *outwards* in kindness the whole world will become kin and heavenly. The great Swedish seer has truly said: "The delight of doing good originating in love, and operating by wisdom, is the very soul and essence of all heavenly joy."

Kindness is wisdom. There is none in life  
But needs it and may learn. (Bailey's *Festus*)  
(Rev.) S. J. NEILL

## Last Sunday Evening at Isis Theater

Mrs. M. Tyberg Speaks on "The Common Sense of Theosophy"

ONE of the most interesting papers that have been read at the Isis Theater for a long time, was that of last Sunday evening by Mrs. M. Tyberg, on the "Common-sense of Theosophy." Exigency of space in these columns prevents a full reprint, but the following few passages will give the reader some notion of the subject. OBSERVER

The common sense of Theosophy has been tried and tested throughout all time, and to a certain extent by all peoples. It has an additional virtue in that it is the very source and essence of all that body of wisdom, portions of which seem to have been assimilated during different lives on earth by those individuals who possess common sense. We are all aware of what it means to say that a person has common sense. The words imply that in the organization and character of that individual a certain balance has been reached that prevents him from rushing to extremes and losing time and strength in useless flights or in the performance of actions that will only be regretted if performed. . . .

The complexity, the growing diversity of external conditions in the world was a necessary stage in the unfolding of the drama of the Soul's purpose in this life-cycle, but this very complexity and diversity and the mental development that accompanies them have led to the building of walls of separateness between races, nations, individuals, so that though people in the world know much more of one another's lives and customs and beliefs than they ever have before, it is difficult for them to imagine a common guiding principle of life.

Here steps in Theosophy and by relating all that remains of truth in every religion, philosophy, or other group of teachings that have instructed mankind, to the Wisdom-Religion, the source of them all, bathes all anew in the spirit of universality, vivifies, unifies, rescues all the simple, efficacious principles of living on earth and offers them once more, the same truths, but with as much more revealed and added as this age requires to enable it to guide human life by principles based upon eternal verities. And these simple teachings concerning man in his true relation to everything else in the universe, this re-statement in a form clothed with the sun of the ancient wisdom, this highest truth once more set before humanity in such a way that it can reach every one, and can set him on the path of normal and harmonious development, inspired and informed through his own Soul by Universal Wisdom, is the common sense of Theosophy. . . .

People in early times in all countries seem to have had a simple wisdom, an everyday knowledge of principles, that had filtered out from the teachings of their Sages. All folk-lore, legends, sagas, and sacred books teem with this. When we read them we wonder at the stupidity of human beings today, considering that so long ago such simple lessons were given in the mysteries of human nature. Full of universal truth are these remnants of ancient lore (and therein lies the cause of our joy in them), close to God, to Nature, and to the heart, especially the heart of the child. It is only as we attempt to re-clothe the teachings of later religions and philosophies in the old magical forms of the universal common sense, that we get any life into them that can be felt by a child. . . .

It is quite possible for the high principles taught in any great religion to become so clothed with the imperfect ideas of their later exponents, as to lose their hold on the hearts of men. These teachings become divorced from Universal Truth, they become narrow, they suffer by material and coarse interpretations made of them, their devotees become separated from the devotees of other religions, life among them can no longer be lived according to any broad universal principles. The narrowness gradually limits all ideals of life. People influenced by teachings of this kind can not be said to share in that broad sweep of eternal wisdom that carries the impulses of the heart in the right direction. What they might regard as "common sense" as a ruling principle, might seem right to them, but at the same time be far from the broad purpose of the Soul. When one sees people like this, rigid, conventional, their eye on the main chance, dead to generous feeling, unable to conceive of humanity as one, the old proverb, "sorrow is surgery," comes to mind. The way will have literally to be cut to their hearts by the only surgery that can be used efficaciously to find a quick spot. . . .

One of the curious conditions arising from this impotence in acting according to what is stated to be right, and what is an article of common belief,

is the attitude toward heaven that has got fixed upon many orthodox minds because the teachings they have absorbed have lost their spiritual force and cannot arouse men to act according to their beliefs. For centuries members of Christian churches have held that at death those who accept Christ as a savior go to heaven, and that those who do not go to hell. At the judgment day all are supposed to be gathered before the throne of God, and the sentence is given. Then at last men are obliged to face themselves, and face themselves before their fellows and their God. They stand confessed; they have nothing more to win or lose. Hypocrisy will serve them no longer. It is a dramatic situation. All see themselves for what they are, and know that belief in God and the Christ could have saved them, if it has not. What realizations would take place at such a time! How clearly men and women would see at last! But they are all dead and nothing more can be done. They are really at this time better fitted to live and to begin to work in a true way, because they have been brought up short to look at themselves. But they are dead. Even the good who are considered fit for heaven have no further opportunities for activity, though right on the other side of the throne of God is plenty of material to work upon, plenty of men and women who have realized their wrong-doings and the necessary consequences, might now with a little encouragement start bravely on right lines.

There may be now comparatively few who believe in the possibility of such a judgment day and such a complete parting of the ways for good and evil men, but many support the churches that teach this belief whether or not it is accepted by the churchgoers. And these dark and narrow conceptions can be traced as influences which still keep the light shut out from many minds. Contrast this with the common sense teachings of Theosophy. A judgment day? Yes, *every* day as man faces himself and courageously meets the results of his acts in this and other lives. A God who is Judge? Yes, a God *within himself*, the Higher Self of Man, his divinity, ever ready to shed its light upon him and teach him to discern good and evil and choose the good. Death? Yes, *death daily* of all the lower that must die in order that the higher may live and control. But death of the body? Yes, when the body is worn out, it is laid aside, peacefully and consciously, if man will, and another prepared for use, after a term of rest for the Soul—the real Man who occupies the body. And heaven, where is it? Here on earth, if the divine will is called into action by the individual and the lower desires and tendencies so mastered that man finds his power to help, finds his true comrades who are working along the same path, lifting the whole.

When this common sense teaching of Theosophy has sunk into the hearts of people in many lands, when it is a part of them, and thought and belief and training are once more in harmony with Universal Truth, there will be the hope of humanity living up to the maxims that have been recognized all through the centuries as embodying the truth about the best way to live. And this living by the best, making it a power in the life, transforms the lower. Ideals are lifted, possibilities quickened, walls of separateness torn down; the unity of all things can be seen; imagination and will can be brought into play in the daily life, and the things that seem common and burdensome can be invested with magic. The common sense of Theosophy makes the learner responsive to all the Light and Beauty and Love and Power of the Universal Heart.

### The Loafing Spirit

AT the International football match at Glasgow there were 150,000 spectators and the gate money was £7000. Many of the people must have paid large railway fares and lost at least one day's work.

There has long been a general feeling that the love of sport is not worthily represented by crowds who flock merely to watch idly other people playing. There is also an idea that the ever-increasing love of this kind of amusement indicates a spirit of loafing in the population; and the state of affairs has been compared to that existing among the Roman populace in the days of the amphitheatrical shows. One can not but be struck by the want of originality and individual independence shown; and the thought comes up, Can these people be the kind out of which freedom is made?

Whether it is the people themselves who are to blame, or whether the system of education is wrong, the fact remains that there is a lack of ideas and ideals. And there is a general feeling that in these days the people ought to rise to something higher. The chief fear is that a state of decadence is indicated and that this is a menace to the country's future.

It seems clear that education has not succeeded in preventing the growth of such a mass of unoriginal people or availed to give them anything upon which they can fall back to relieve the vacuity of their minds in hours of leisure or anything to inspire them to an independent line of conduct.

A population like this is a positive bid for servitude, not for freedom. For what could the most benevolent administrator find to do with such a crowd? He would be obliged to keep them in order. On the other hand, by cultivating independence of character, we create the conditions of freedom; for rulers do not go out of their way to govern people who can govern themselves. The much abused "despot" is often a self-sacrificing individual who undertakes to keep in order those who cannot keep themselves in order.

The people evidently have as much freedom as they can use. There is plenty of freedom for each individual to strike out an independent line and be somebody instead of merely an exact duplicate of hundreds of thousands of others.

E.

### The Twentieth Century Bedlam

WANDERING through an asylum the other day we noted a number of sad cases. But the sadness was our own; the inmates were perfectly happy. Each had a scheme of some kind whose merits he was enthusiastically vaunting.

We were not sad on account of the inmates, therefore. As the world now is, there must be a proportion of such. We can be relatively content so long as they are well treated, happy, and a reasonable proportion of them on the way to recovery.

But each of these inmates had an audience of sane people: not looking on compassionately, but eagerly listening to the schemes as if they were real contributions to modern life.

Then we noted a still stranger phenomenon. Under close scrutiny a good number of the apparent lunatics turned out to be sane. But

being incapable of thinking out a sane and useful novelty, or finding that an insane one attracted a larger and more credulous and enthusiastic hearing, they were confining themselves to the latter variety.

Suddenly we awoke. We had only fallen asleep over the morning papers. The last item that had attracted our waking attention was a long account of a woman who was proposing to "free her astral body" by a prolonged starvation. The account was quite serious. To the reporter—and presumably therefore to the readers—"the freeing of the astral body" apparently seemed a nice sort of thing to do, and starvation a nice sort of way to do it.

The next item, equally seriously presented, was an account of a new way to raise babies. Their "vibrations" were either to be merely ascertained, or also altered—we could not quite glean which; but when the maneuver was effected their evolution into great souls was assured.

Every individual has a soul color, a number, a keynote, and a name. The number indicates the age of the soul and your name indicates your color. If your name is wrong your soul cannot be sufficiently developed.

We are now in deadly terror lest our own name—Blank—ought to have a y instead of an a. We are thinking of visiting the baby-farm, perhaps returning to have our visiting cards printed otherwise.

The next item indicated a still swifter way of regenerating society. You had only to hypnotize all the children into all the virtues. All that is necessary is to murmur to Johnny in a low impressive tone: "Johnny you will never again have the least wish to mount on the family Bible and steal jam from the jar on the top shelf."

Then there was a proposal to purify the world by slaughtering or sterilizing all the criminals, leaving only the shining and impeccable ones—ourselves—to people the redeemed world with our properly vibrated and hypnotized children. Every criminal, of course, gets into jail; and every one in jail is necessarily a totally different order of being from ourselves. So the matter is all clear and easy.

Along with this were other proposals to segregate in special communities all the epileptics and all the consumptives. The psychomoral atmosphere developed in such communities need not matter; it would affect us in very strange ways, but we could easily ascribe the results to some other causes and invent a serum to meet them.

Another proposal, stimulated into utterance by the discovery that by repeatedly informing your diseases that "All is God" they would get under cover or change their form, was for nothing less than the hypnotization of God himself. This you were to effect by repeating "I am wealthy" very many times. After a while God—"The All-embracing Good"—would hear, accept the suggestion, and say, "Why, so you are!"—and then of course you would be.

A physician had found—or for the benefit of his pocket and renown, wished people to believe he had found—that by developing your muscles in a special way you could develop your brain, and therefore (of course) also your mind and therefore (of course) also

your soul; and by this simple method, in a year or two become an intellectual and artistic and spiritual giant. Not too much of the method was given in the long account lest people should take to spiritualizing their own biceps instead of paying over a fee to be shown how to do it.

Then there was a medical paper. We learned from this that by proper mutilation of tadpole's spinal cords and then sewing two of them together back to back you could find out how their nerves grew. That the cells grow to such or another shape and function, and in such or other ways elaborately relate themselves to each other because they are modeling themselves upon a vital ethereal *eidolon* or (to us) invisible pattern—is an idea out of date. It is all a matter of peculiar chemical reactions. That the doctors would learn some real secrets of animal life if they would drop their materialism and its attendant vivisections and spend their time in a saner way, is old woman's talk, you know.

Another proposal—but why should we go on? Are not these samples enough? We can only apologize to the adepts whom we have quoted for the dream to which their proposals gave rise. Our vibrations somehow got wrong; we had neglected to be hypnotized in childhood; and we had not sufficiently considered that since God is All, these proposals must have come from him.

JOHNNE BLANKE, No. 666

### Not a Square Deal

THAT which most disgusts the average citizen in this mutilating of four-footed friends, until death releases them from agonies no longer endurable, is not only its sickening cruelty but its absence of fair play. Had the dog, for instance, a vote, this question of a right to vivisect him would be dropped with amazing suddenness. Never again would we hear it advocated; laws for his protection would be passed before another sun could set.

Swift, indeed, would be the realization of the fact that vivisection is by no means a necessity.

But the dog has no vote. He is helpless and without friends. For his torture and his death there is no punishment. When he becomes a hopeless wanderer he can be bought for little money. Securely bound and gagged, he endures, in silence, worse agonies and longer drawn out than were suffered in the Inquisition.

It is this deliberate violation of every principle of fair play, this safe disregard of the rights of weaker things, that revolt a civilized community.

"As a surgeon I have performed a very large number of operations, but I do not owe a particle of my knowledge, or skill, to vivisection. I challenge any member of my profession to prove that vivisection has in any way advanced the science of medicine, or tended to improve the treatment of disease." (The late Dr. Charles Clay.)—*Life*

### Masonry in Saxony

THE King of Saxony, by a recent edict, now permits the officers of his army to join Masonic lodges, a privilege they have not enjoyed since the middle of last century. The reigning House is of course traditionally Romanist, although 21 out of 22 of the population are Lutherans. The edict is directly in the face of Vatican influence, and the opposition to it seems likely to recruit the ranks of the Craft from quarters far beyond the army. For thousands who never thought of the matter before have begun to speculate upon the real reasons of official Romanist hostility to the Masonic Order. Whether they will find those reasons is another thing. They are no more necessarily known to every priest than every Mason. CRAFTSMAN

## John Knox, Scotland's Great Religious Reformer

WHEN all that was mortal of John Knox was laid to rest in the old churchyard of St. Giles (said by tradition to be Parliament Square, but that is uncertain, as Knox's grave, like Calvin's, was left unmarked and the churchyard was later covered by buildings) the Earl of Morton uttered these words: "Here lieth a man who in his life never feared the face of man; who hath been often threatened with dagge and dagger, but yet hath ended his days in peace and honour."

John Knox was born and bred a Romanist. It is stated that about 1530 (when twenty-five years of age) he took orders in the church of Rome as a secular priest and that for a decade or more thereafter he was connected with a Romanist establishment near his birth-place, the county of East Lothian, Scotland. The martyrdom of Wishart (for Romanists and Protestants were at that time zealously slandering, abusing, robbing, persecuting, murdering and hating each other in the name of Christ) awakened Knox and made of him first a thinker and then a zealous protester against the Romanist system of religion. He abandoned scholastic theology, announced his adherence to the Protestant faith and shortly entered upon his career of spiritual reformer.

Antiquated and even bigoted as now seem many of the views held by John Knox, in that day he stood forth as an advanced thinker and an honest man, as one who truly loved humanity and did his best to serve it. When we see him putting the best of his spiritual energy into disputations as to whether "wafer-bread" or ordinary bread should be used for the sacrament, or into the effecting of a reform by which worshipers should sit instead of kneel in the act of communion, let us not smile. He had not the light that even the most creed-bound may have today. He had no glimpse on brain-mind lines of the great truths of Theosophy although he did have its light in his soul or he could not have lived zealously and have died in peace and without thought for himself. His was the typical "ecclesiastical brain" and in point of fact his genius for disputation, his close knowledge of theological doctrine, would seem to the Theosophist to have led him away from the truth, not toward it as he himself thought. The great spiritual advances in his life were made when his soul was thrilled by some strong and impersonal emotion, as for example at the pitiless martyrdom of good men by professed followers of Christ merely because of differences on points of doctrine.

On some lines the ideas of John Knox were antiquated in the extreme even for that day, as when, while writing and preaching in Gen-

EVERYTHING hath two handles: the one soft and manageable, the other such as will not endure to be touched. If, then, your brother do you an injury, do not take it by the hot and hard handle, by representing to yourself all the aggravating circumstances of the fact; but look rather on the soft side, and extenuate it as much as is possible, by considering the nearness of the relation, and the long friendship and familiarity between you—obligations to kindness which a single provocation ought not to dissolve. And thus you will take the accident by its manageable handle.

—Epictetus

JOHN KNOX'S HOUSE IN EDINBURGH,  
THE CITY IN WHICH KNOX PREACHED IN 1559

eva, he put forth a treatise entitled *The First Blast of the Trumpet against the Monstrous Regiment of Women*. It was scarcely politic, for England was faring passing well under the "regiment" of Elizabeth and the reformer's native land was also ruled by a Queen, the beautiful but ill-starred Mary, Queen of Scots. Needless to say the ill-will of both was incurred and a little later, when Knox desired to return to Scotland and applied to the English Government for permission to pass through Elizabeth's domain, it was denied him. Whether Knox changed his views as to the "regiment" of woman or whether more immediate reforms absorbed his attention is not clear; all we know is that his purpose to blow a

second and third "Blast"—in his own words, "thrice to blow the trumpet in the same matter, if God so permit"—was never carried out. One experience which happened in the same year is worth recording. A Theosophist might add it to the chain of evidences tending to show that history repeats itself. A certain abbot of Crossragwell, one Quintine Kennedy by name, had put forth certain writings anent the mass, purgatory, praying to the saints, etc. and had announced his intention of taking up these subjects more fully in his chapel on a certain date. On the Sunday specified Knox quietly appeared in the neighborhood, the news of which so upset the good abbot that he absented himself from his chapel altogether—and Knox preached in his stead! A little later a famous religious debate occurred between the disputants, forty witnesses being present on each side. Both the sides claimed to be victorious, but a little later, "to counteract the one-sided reports circulated by the abbot and his friends," Knox himself published a history of the debate taken from the records made by the notaries present; so conclusions may be safely drawn. How reminiscent of this was the quick departure of two ecclesiastical persecutors of Katherine Tingley when she (represented by her lawyer) appeared upon the scene! How reminiscent, indeed, of the famous "Debate" to which the Theosophists challenged the clergy of San Diego some six or seven years ago! Details differ but who shall say that the inner forces at work were not the same?

The power of John Knox over men was as tremendous as his personal courage. On one occasion, when through the representations of Romanists to the Queen, Knox had been publicly proclaimed an outlaw and a rebel—this in the land of his birth—he boldly entered St. Andrews and announced his intention to preach in the Cathedral. "Undismayed by the threats of the archbishop, unmoved by the remonstrances of his friends, he carried his purpose into effect, preaching for four successive days, and with such signal effect that the provost, bailies and inhabitants agreed to set up the Reformed worship in the town, stripped the church of images and pictures and pulled down the monasteries."

The Theosophist would not do today all that John Knox did, any more than he would, or could, dispute over the same doctrinal points—or, in fact, dispute at all—but all can afford to emulate the Scotch reformer's courage in carrying out an honest purpose. He lived in an age of spiritual quarreling (if such an anomaly can be conceived), an age of religious (!) disputation, but nothing could make him lose sight of his mission—which was to serve his fellow men. STUDENT

"Even so it is not the will of your Father which is in heaven, that one of these little ones should perish."—Jesus

JUDGE J. W. MACK, formerly of the Juvenile Court of Chicago, deserves well of all American women for his courageous efforts to open the eyes of parents to certain fearful dangers their children are running in multitudes of cases, from the absence of wholesome restraint and intelligent supervision. Writing in the *Ladies' Home Journal* for May on the need for protecting the young, Judge Mack makes the horrifying statement that in three years—only three years—several hundred distressing cases have been brought before him of young girls ranging in age from seven years to eighteen, "every one of whom had made a misstep"! This was in one Court only, and then, who knows how many hundreds of cases were hushed up for one that was dragged into the miserable publicity of legal procedure!

In his unsensational, but none the less harrowing article, the Judge accentuates his points by melancholy illustrations from his own painful experiences on the bench, all of which, in his opinion, point to at least two important conclusions: 1st, that parents should never lose the confidence of their children as being their wisest and most willing advisers; 2nd, that parents should watch far more carefully the growing mental and physical natures of their children and be able and ready to answer the spoken and unspoken questions which will otherwise be responded to in ways most undesirable and with consequences most disastrous. Yet multitudes of fond, foolish parents sit complacently congratulating themselves that all is well—until the shock comes.

The Judge is writing chiefly about the fearful danger threatening undisciplined and ignorant young girls which, from the general standpoint of the world, is accounted more degrading than for the opposite sex. To the

## Perverted Instincts and Parental Neglect

student of Theosophy there is no difference, for in either case, when temptation has overpowered the will, or sheer ignorance has produced the inevitable disaster arising from playing with fire, one of the main pillars of spiritual life—purity in thought and deed—has been undermined, and many years, perhaps incarnations of suffering must follow before the thread of high purpose can be resumed in peace. It is needless to enter into the details of Judge Mack's excellent article with its plain speaking to parents upon their responsibility, but we would draw particular attention to one reference he makes to a question upon which Katherine Tingley has been most earnest in speech and energetic in action. He points out that there are many parents who are quite unfit to instruct their children properly in the true meaning of life's problems, and who are even unwilling to call in the aid of the wise and kindly experience of the family physician, and that there is a consequent demand for some wholesome system of guiding and protecting the young in connexion with every school to save the otherwise probable victims from a fall of whose magnitude they, of course, have no adequate conception.

Many years ago, when Katherine Tingley was working amongst the "Submerged tenth" of the East Side of New York City, she made many sad discoveries of the same nature as those made by Judge Mack, and found the truth of what the rescue societies have finally discovered and now speak of, *i. e.*, "that one-half the girls would never have come to their 'rescue homes' if their mothers had done their duty." With her remarkable insight Katherine Tingley soon discerned the only effective remedy—the early training of the children in the way they should go—but not

until she succeeded to the Leadership of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY had she the full opportunity of putting her original ideas into practice, because until then she had not a body of workers willing to subordinate self in harmonious co-operation to the great end of elevating humanity on the practical, spiritual lines of brotherhood. Not too many who were faithful to their proclaimed ideals did Katherine Tingley find in the Theosophical body, but there were enough to begin, and the result of her tireless work of training teachers, re-organizing and protecting the Theosophical activities from foes within and without, has been the magnificent success of the Rāja Yoga system of education, which strikes to the core of the evils discussed by Judge Mack, as of all the others arising from the lower nature.

Students of Theosophy will heartily agree with the Judge that for the crying evil of unrestrained vice in the young, "Society itself, not fully awakened to its obligation, is responsible," and as Society is principally composed of parents who are most of them not alert to the danger, or who do not know how to eliminate it when they see it, what is there to do but to nip it in the bud by starting in early life with the individuals who will shortly form Society themselves, *i. e.*, the children? To show how little even intelligent mothers know of the natures of their children, the Judge gives an appalling instance of juvenile depravity in which a number of school children were concerned in Chicago. The mothers of these unfortunate young people were energetic Club women, probably considering themselves qualified to advise on large matters of municipal or national policy, perhaps chafing at "the limitations man would place upon woman," and yet their own higher duties were being so shamefully neglected that their darling children were able to take advantage of their mothers' absence at the regular club meetings to ruin their lives!

Katherine Tingley has said with absolute truth, "Let me have a child from the time of its birth until it is seven years old and all the temptation in the world will not move it." Why is this? Because "it will have been taught the divinity of its own soul." It will have learned self-control—the control by the Higher Self.

The Râja Yoga system of education, now firmly established at several national centers, is based upon the principle of *self-control*, not control by fear or force or desire for reward or other outside agency; and as this saving principle becomes established in the pupils under the equal development of the physical, mental, and spiritual parts of the nature, purity of thought and deed, the innate modesty and dignity of the Higher Self become manifest, and the energies of the lower passions are transmuted from tyrannical masters to obedient slaves. Thus an unshakable bulwark of protection is created. Judge Mack points out with great acumen that

An innate or inbred modesty not only makes a girl in every way lovely, but it is also her greatest shield; her sole completely reliable protection.

And he proves this by evidence given by boys and men who, the world over, can always tell whether or not a girl or woman is approachable—this intuitively, a strange gift, but one which has been cultivated for ages and incarnations.

In her wide experiences at home and abroad Katherine Tingley found that as there were so many parents utterly unfit to train their children, the latter were in imminent danger from the absence of self-control and the needed firm and kindly treatment, free from either unwholesome coddling or the neglect of weak and foolish parents. When she established the Râja Yoga Schools and Academies she insisted that it was useless for pupils to be entered for a few weeks or a few months, as the required results could obviously not be obtained in a short time, for it takes long patience and individual watchfulness by carefully trained teachers to eliminate the weak spots and to foster the growth of the better qualities. For complete success it is also necessary that the child's progress should not be hindered by frequent gaps caused by unnecessary vacations—unnecessary in a proper system of education in which the mind is never over-taxed. It is a truism that more than half of the benefit derived from the best class of education given in boarding-schools to the children of the well-to-do, and also in colleges and universities, is very often destroyed by the license of reaction during vacations.

As the Râja Yoga system is the direct outcome of the logical and satisfying philosophy of Theosophy the time is here when that portion of the world that really thinks and is looking for enlightenment is gradually beginning to find out that Theosophy is what it needs. For Râja Yoga is the way to "the sweet, clean, strong life" of the soul.

It is impossible to close without drawing the attention of the reader to the significant fact that if any Theosophist, even a few years ago, had written as Judge Mack has done in his article—which is placed in the forefront of a widely-read magazine, and which

has no doubt been respectfully studied by tens of thousands of inquiring women—he would have been immediately charged by the carping critics with endeavoring to separate parents from children, with trying to undermine the private rights of parents to do what they like with their own, and goodness knows what else! Truly it seems that the world has moved a little towards the Theosophical position, but how slowly! More helpers, more intelligent devotion, more joyful self-sacrifice is the need. Who will join the ranks of those who are working in the only way that can produce permanent results?

"CAPITÁN" ROSA CASTELLANOS  
Who nobly served her country in  
the Spanish-American War

### From Center to Circumference

**I**N journeying from Southern California to New York, it is striking how Nature mirrors the descent—if that word may be used—from transparency to density of atmosphere and in what a variety of ways she expresses thought.

Allowance perhaps should be made for the high altitude of the start from Point Loma, the Headquarters of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY; yet it was not by the light of the sun that the start was made, but by that of a moon nearly full, and it was accompanied by songs and flowers (with treasures hidden in them), by comrade-greetings, hand-clasps and messages for distant England, that from there will pass on again to many lands. Those who know the true atmosphere of the Center will feel that the outer expression is seldom repeated, that it varies in originality but never fades as a picture before the mind because prompted by the changeless Heart of inspiration. There were the domed circular buildings; the groups on the steps leading down on either side; children within the porch of the great door; and in detachments, until Tent Village was left behind, were groups of comrades and well-wishers.

There was nothing enervating in the fresh cool air, it breathed of energy and effort, while the palms sent messages of peace from West and East. Still, it was a gradual descent, from a wealth of flowers, roses, sun-

shine and breezes first, to simpler wild-flowers, hawthorn, flowering dracaenas; then, bordering on dryer land, cactus, and a weird variety of palm, with stretching arms pointing in strange shapes and all directions; a descent passing from sunshine into gray shade: not to be regretted, for knowledge is, sure that the sun travels along its rays, even if unobserved—a Jacob's Ladder of life-giving power—else those in the gloom might forget its existence, and those in the light fail to realize what shadow is. Then the deserts of Nevada and Utah are crossed, holding so many secrets of life, but now showing no blade of grass, just great bare plains with hills or hillocks rising from them, all a uniform dun color, only the clouds making lilac or purple shadows.

With a higher altitude a more northern land shows its patches of snow in the foreground and on the mountains, adding to their height and beauty with its pine trees that speak of strength and endurance. In Iowa are cattle and sheep grazing, and farms under cultivation. Here a dark, almost black, cloud gathers and remains by night and day; between it and the horizon is a clear light space of sky, where the sun before setting shows a typical sea of glory, and where the full moon rises; aided by summer lightning it fights out a way beyond the clouds. The clear blue sky and atmosphere of the Pacific Coast have now disappeared, a growing soiled-looking haze or veil shuts it out, yet the heat has grown intense. The sun shines, all its spring power seems to have passed into the exquisite greenness of the fresh foliage—perhaps Nature knows that the mass of humanity is too materially occupied to look at the sky. So, with a great deepening of the gloom around the cities, the suburbs of New York are reached. Here the winds join in the fight for a day; they are beaten by a warm spring rain and the United States shores are last seen in a haze. Another day discloses the Atlantic Ocean a smooth indigo, and the sky, well—blue (!) to the eye that has not lately looked on the skies of Point Loma.

A subtle difference lies in atmospheres. Many know, or have noted, that difference between the East and West of America, or between the Eastern and Western Mediterranean, between Japan and other countries. The study of Theosophy as now given to the world by Katherine Tingley can alone throw light on such problems. (On Board R. M. S. *Adriatic*.)

FANNY JANET BUSHBY

**I**T is interesting to note the instances so frequently cited in the current papers showing that the influence of the new order of things which is opening door after door to women extends beyond the confines of the dominant race. In a recent issue of the CENTURY PATH mention was made of Miss St. Cyr, a member of the Winnebago tribe, who as a lawyer has done so much for her people. In Kansas City, Mo. is another Indian woman lawyer who took an active part in the attempt made to preserve the historic burying-grounds of the Wyandotte Indians. The land was recently designated to be sold by the United States Government and this patriotic Indian woman has made every effort to save the spot, which is held as sacred by her people, from desecration.

# OUR YOUNG FOLK

## America, the Home of a New Race

ONE of the most interesting stories in history, to those who speak the English language, is that of the spread of English-speaking people and their transformation of the waste spaces of the world into homes for mighty nations. And of vital interest to the whole world is the story of the opening of the land now the United States of America to the vast throngs who pressed westward to take their part in the building of the new race here to find its home.

Many other nations have had their periods of race-expansion as well as of conquest. The all-conquering Roman power spread over Europe only in turn to be absorbed by the Teutonic peoples who came forth from the forests of the Rhine and the Danube. The movement was taken up by the dwellers along the coast of the Baltic Sea and North Atlantic Ocean, and there were new rulers in every land from Sicily to Britain. In all these cases, the sway of the conquering races was never permanent. They gave names to the kingdoms but they were absorbed by the people they subjected. They adopted the laws, language, and habits of those they conquered, the Goths becoming Spaniards, the Danes Irish, and the Franks and Northmen Gauls. The one exception to this general rule came when the Jutes, Angles, and Saxons invaded Britain. Here, in this little island there sprang up a type of nationality distinct from those of the European mainland, a branch of Germanic stock which was destined to grasp world-wide power and hold in its hands the fate of the coming years.

The discovery of America gave the opening for an even vaster race-expansion than the Teutonic wanderings had been. With the voyages of Columbus and his successors European colonization began, and shoals of settlers were thrust upon the shores of this new continent, the most important of the lands beyond the sea. Again the stock that had conquered in Britain conquered in the race for supremacy on the American continent and won command of the ocean.

It was not until the American people had developed a national life, become a separate and individual people, that they were able to take possession of that part of their continent lying between the eastern mountains and the Pacific. This winning of a wilderness for the benefit of civilization and in the interests of mankind is the distinguishing work of the American Republic, second only to the preservation of their national life.

At the time of the Declaration of Independence the American colonists all dwelt on the Atlantic coast or along the rivers flowing into the Atlantic. In a century and a half they had spread only from the Atlantic to the Alleghanies; but in the three-quarters of a century after becoming independent, they had spread from the Alleghanies to the Pacific. Beyond the chains of forest-clad mountains stretched the dim wilderness filled with wild beasts, lurking foes, and rushing rivers, nameless and unknown. Into this somber woodland pushed

## AMERICA

Bayard Taylor

FORESEEN in the vision of sages,  
Foretold when martyrs bled,  
She was born of the longing of ages,  
By the truth of the noble dead  
And the faith of the living fed!  
No blood in her lightest veins  
Frets at remembered chains,  
Nor shame of bondage has bowed her head.  
In her form and features still  
The unblenching Puritan will,  
Cavalier honor, Huguenot grace,  
The Quaker truth and sweetness,  
And the strength of the danger-girdled race  
Of Holland, blend in a proud completeness.  
From the homes of all, where her being began,  
She took what she gave to Man;  
Justice, that knew no station,  
Belief, as soul decreed,  
Free air for aspiration,  
Free force for independent deed!  
She takes, but to give again,  
As the sea returns the rivers in rain,  
And gathers the chosen of her seed  
From the hunted of every crown and creed.  
Her Germany dwells by a gentler Rhine;  
Her Ireland sees the old sunburst shine;  
Her France pursues some dream divine;  
Her Norway keeps his mountain pine;  
Her Italy waits by the western brine;  
And broad-based under all,  
Is planted England's oaken hearted mood,  
As rich in fortitude  
As e'er went worldward from the island-wall!  
Fused in her candid light,  
To one strong race all races here unite;  
Tongues melt in hers, hereditary foemen  
Forget their sword and slogan, kilt and clan,  
'Twas glory, once, to be a Roman;  
She makes it glory, now to be a man!

the men of the axe and the rifle, of the chain and compass, Daniel Boone, Simon Kenton, George Rogers Clark, James Robertson, John Sevier, driven by their restless eagerness for adventure and thirst for exploration of the unknown, and built their stockaded hamlets on the banks of the Cumberland, and the Kentucky, the Ohio, and the Tennessee. Close behind them came the adventurous hunter settlers and their cabins sprang up here and there in the great forest land. Then came the permanent settlers who were thrifty as well as industrious, who erected substantial houses and barns and tilled the soil as carefully as the farmers of the seaboard states. They grasped the land not only for themselves but as an inheritance for their children and their children's children. Well-to-do planters and merchants and lawyers came from families who stood high on the Atlantic slope. New England poured her ideas of righteousness and sound public policy into the Ohio frontier, while Virginian pride of race and courage and hospitable open-handedness spread down out through the southwest.

During the years when the Constitution was being adopted and carried into effect the struggle necessary in order to invade and tame the shaggy wilderness, went on. Hamlets were erected into free governments which should

form part of the union founded on the seaboard. This struggle was of vital importance, for then was decided whether the vast tracts of fertile land on the western border should be won for humanity and civilization and whether a mighty nation should there abide.

There was much in that front rank of civilization as it spread from ocean to ocean that we of the 20th century in our more merciful humanity deplore. In this epic of world conquest and building and welding of a nation, as on a field of battle, many turbulent elements were tossed in wild confusion. Deeds rough and lawless, wanton aggression, treachery and meanness can be traced. Yet the preponderating strands in this continental fabric were of lofty and generous daring. A strong and simple people with love of freedom at their heart's core, composed the bulk of the frontier population; upright, resolute men, courageous patient women, toiled hard, endured greatly, were devoted to their country and ready uncomplainingly to lay down their lives for their friends. Such as these formed the backbone and body of the State.

While the pioneers were mainly Americans from all the States in the Union, there were numbers of immigrants from nearly every country of Europe and even from Asia. Germans, Irish, Scotch, Scandinavians, French Huguenots, all the representatives of numerous and widely different races, were speedily welded into one people under the hard conditions of life in the wilderness. Their iron surroundings served as a mold which turned out all with new sympathies. Long before the first Continental Congress assembled, these makers of roads and builders of towns who were to establish young commonwealths from the Alleghanies to the Golden Gate, had, whatever their blood, become Americans in thought and character, a distinctively and intensely American stock.

A wonderful picture still — the magnificent areas of the United States with the ever flowing stream of human life pouring in upon them and being assimilated and transformed just as the Roundhead and the Cavalier, the Hollander and the Huguenot were in early colonial days. The stream is caught up in that current which pulsates through all the channels of life and which we call the American spirit. Full of intense vitality is this spirit; full of spontaneous eagerness and reaching forward to all the light and beauty which the future may hold in store.

And what possibilities must lie in wait for a nation thus formed! From east to west it stretches. The beginnings were in the East; but in the West, on the very "sunset rim," is the key to the highest and noblest that the patriots and comrade-citizens of the future shall attain. This is where, at Point Loma, California, the teachings of Theosophy, and the Râja Yoga education that awakens the god within, are fostering the Higher Patriotism, that will lead to the full expression in daily life of the fairest possibilities of the new race in America.

## The Kingdom of the Princess of the Pine Wood

HIGH on the bank of a deep-flowing river grew a lordly Pine-tree that stretched its cone-laden arms to the north, south, east, and west, spreading balmy fragrance all around. Through its green depths the zephyrs wafted the odor of violets. "She is coming, the little Princess of the Woodland," and the Pine-tree sang a song of joy. Only the beautiful River flowing between its high banks knew how the Pine-tree loved the Princess, for he loved her too, and together the River and the Pine filled her life with sweet music.

Who was the little Princess of the Woodland? Just a pretty brown-haired, bright-eyed little maiden the villagers among whom she lived thought, one who loved to roam in the pine-woods for long hours together. Only the sweet music of her grandfather's flute could call her away from the woodland. In the winter by the great open fire, or in the summer in a quiet corner of the sweet old garden round her home, she would steal softly to her grandfather's side and would listen, oh, so quietly, while he played. Did he guess, the dear old grandfather, as he looked down upon her, that as the notes flowed in a silver stream from his flute, that the little girl saw the elves and fairies of her woodland kingdom, dancing joyously amidst a whirl of beautiful colors?

With the first light that peeped into her window one summer morning the little girl awoke, and before the sun arose she was standing under her beloved Pine-tree. In her hand was a branch of laurel bright with rosy blossoms. As the sun appeared she waved it in a circle three times around her head and pronounced a magic word. Instantly the whole woodland was resounding with children's voices. From every direction children came trooping in. There were tiny toddlers, sturdy boys and girls, tall youths and maidens, all singing as they came. And the Princess? The laurel branch was now a magic wand tipped with fire, the wreath of leaves that she wore in honor of the summer festival was turned into a crown of gold, and her simple white frock was changed into a flowing robe of softest silk, with a golden star embroidered on the breast, and she stood on a throne strewn with flowers. All this, however, was as nothing compared with the shining light in her eyes, as she looked out over the sea of children's faces.
